Such a prospect ought not to lie idle for the want of the wherewith to push it, with so much capital in the State, seeking for investment.

Rough and Ready.

But little could be learned of their quartz operations.

The Torpie company—working in gravel—having stripped off, last winter, the top dirt down to what was at the time supposed to be bed-rock, and not finding gold in sufficient quantity to pay, they concluded to sink through a strata of volcanic ashes and decayed boulders (that require but the slightest blow to cause them to fall to pieces), whereupon they found themselves well rewarded for their perseverance. They passed through a body of gravel six feet thick superimposed on the true bedrock, that is now paying handsomely.

The San Francisco Copper Mine, Situated at Spenceville, in the southwestern part of the county and within 12 miles of Wheatland, Yolo county, has been opened to the depth of 150 feet. Three different cross-cuts have been run, developing a solid body of ore from 75 to 100 feet wide, the ore averaging about 7% copper. The company have patents, which cover in the aggregate 3,000 feet of ground.

While at the mine the following facts were gleaned as to

The Process of Working.

In the first place, a portion of the ore is roasted in stails and some of it in heaps, the time required for the purpose being from three to four months.

Second, it is conveyed to wooden tanks where it is leached.

Third, the liquor is now transferred to barrels, and the copper precipitated by means of old scrap iron, requiring about two hours for a charge of 2,000 gallons. The strength of the solution is about 15° (Baume), each charge containing about 150 lbs of copper.

The company at present are working two barrels and have also two more nearly completed, and keep on hand at least 6,000 tons constantly roasting. The total of copper yielded by the mine the past year has amounted to 350,000 lbs, which readily brings in the market 17 cents per lb. This is said to be the principal mine, if not the only one in the State, that is producing in quantity what is known as cement copper, which averages 90% fine. A. C. K.

Mining Notes from Siskiyou.

EDITORS PRESS:—Last week I paid a visit to Callahan's ranch and South fork. In conversation with Mr. Diggles, of Fort Jones, he informed me that the new flume of Parker & Co. was the 'best ever constructed in this county. As Mr. D. has been here over 20 years, and is considered authority regarding mines, etc., I felt an interest to see it, which I did last week. It is called Montezuma, and is situated near the junction of the south and east forks of Scott river, near Callahan's ranch, and it is owned by Alex. Parker, H. Peterson and A. N. Denny; Parker supplying the capital and Peterson superintending the work. The flume was commenced a year ago, and is now about finished, cost, \$15,000. It is three-quarters of a mile long, six feet wide, and 44 inches deep. The blocks used are nine inches thick. There is one inch fall to every box of 12 feet. The old flume was used six years, but was too small, being only three feet wide and 20 inches high. Water has been turned into the new flume. They have a good head and the claim prospects well. About 20 men are employed here, three-fourths of them Chinese. It is intended to run everything through except the large rocks, which are moved by derricks. When they get under good headway, I expect to visit the flume again, and may have more to say about it. At South fork I found the people just commencing this season's work, with a cheerful outlook. Cumins' quartz mine, on Boulder creek, prospected well when the last work was done on it. Cogins showed me a nice piece of quartz found by him lately, the gold plain to be seen in it; he thinks the ledge is good. Walsh lately picked up a piece of gold on his claim worth \$10.75. There is much good placer ground in this section, but somehow the Chinese have managed to gobble up the most of it, and it seems a pity that so much of the best paying ground should be owned and run by that people to the exclusion of our own race. R. D. NUNNALLY.

Etna Mills, Siskiyou Co., April 9th, 1878.

THE ENGINEER.

Mining Engineering School on the Pacific Coast.

Dr. G. F. Becker, Professor of Mining and Metallurgy at the University of California, presented to the Assembly Committee on Education a statement of the needs of his department. From this statement we shall quote a few paragraphs, showing the field and need for a fully equipped college of mining engineering on this coast:

If there is need of a school of mines anywhere in the world, it surely is here; nor are there many persons who will deny the desirableness of special instruction being given at the University of California, in those branches of learning which are related to mining and metallurgy. The enormous losses arising from ignorance in this branch of industry are notorious, and no one can possibly maintain that education is not at least as valuable to men engaged in this pursuit, as to farmers or machinists. Yet very little has been said in public on the subject, and the Legislature, though it has passed an enactment establishing a Mining department, has appropriated nothing towards its support, except the share which it will receive in the accommodations of the new Mechanical Arts College building. The cause of this fact is to be sought in the absorbing nature of the occupation of mining, and the consequent lack of participation on the part of miners, through their Unions or otherwise, in public affairs of any sort. The development of the College of Mines has formed the especial concern of no particular person or body. It awaits the active interest of gentlemen in a position to emphasize its claims, and with the spirit to undertake the task simply because the object is a worthy one, and in the absence of any decided pressure of public opinion.

I cannot but think that the objects to be attained would repay the exertion of fostering this branch of education. The University of California must always be the center of education for the whole Pacific coast, and no more important or favorable position (London alone, perhaps, excepted) exists for a school of Mining Engineering. This would be true were the natural and technical conditions of the Pacific coast not peculiar. In fact, however, they are unique, and engineers trained under the very dissimilar circumstances prevailing at other centers of education, are necessarily obliged to modify their habits of thought. Their rules of action and their methods of procedure vary essentially to adapt them to the nature of this region. The New York School of Mines must unavoidably lay the stress of its teachings upon the manipulations of iron and coal, the same is true of the schools of Paris and Loudon; while at Freiberg, for example, the conditions of fuel and labor and the absence of free gold ores, renders the appropriate course of instruction only partially applicable to our mining regions. One of the great mining schools of the world is, therefore, destined, sooner or later, to grow up at Berkeley. An institution which will prepare the men who will have charge of the first interest of the coast, and which will also be actively and profitably engaged in the no less important task of bringing to bear upon the thousands of weighty problems presented in the extraction and treatment of ores, the resources of systematized experience accumulated by men of many pursuits in all portions of the world.

Can any one say that it is too soon to begin this work, when the present year will complete the sum of 2,000,000 of gold and silver extracted from the mines of the Pacific slope?

Railroads and Water-Ways.

M. Freycinet, the French Minister of Public Works, makes the following reference to the canals of France, but his propositions are of interest to engineers everywhere:

Navigable water-ways play an important part in the production of the wealth of a country. If it was thought at one time that their usefulness was about to cease, and that they would soon give place entirely to railways, that rather superficial view has not been long in being modified after an attentive examination of the facts. It has been found that navigable water-ways and railways are not destined to supplant but to support one another. Each has its particular attributes. Railways take the least cumbersome traffic, that which requires speed and regularity, and bears most easily the cost of carriage. Water-ways take heavy goods of low value, which only pay for being carried when the cost of carriage is low, which afford railways only an illusory revenue and encumber instead of feeding them.

Navigable water-ways fulfill another object. Their mere existence checks and moderates the rates on goods which are sent by railway; they are a warning to railroad companies not to exceed the limit beyond which trade will not hesitate to sacrifice regularity to economy. In this respect navigable water-ways are much more serviceable than competing railways, for these, fighting each other with equal weapons, generally end by coming to an understanding to avoid inevitable ruin; while the canal boat and railway naturally divide the traffic by taking that which suits each best.

The country has an evident interest, there-

fore, in not neglecting its means of water carriage while it is engaged in developing its railway system. Public opinion regards it in this light and the Legislature has for several years given repeated proofs of its interest in this object.

The steps to be taken to arrive at certain results appear to me to be the same as we have taken in regard to the railways, and which I may here mention. Technical and administrative commissions would likewise be appointed, one for each of the six natural basins of France. They would be composed of similar members, except, of course, in regard to such modifications as the different nature of the subject requires.

The object of these commissions will be, on the one hand, to design new lines, whether of canals or canalized rivers, intended to complete the system of general interest; on the other hand, to settle the basis of the transformation and improvement of existing lines to render them compatible with the new wants of the navigation.

Outside this system regard must be had to the necessity of making a certain number of canals of special utility, which may be conceded for a limited time to departments or communes. These will be the germ of a system of local interest, comparable in certain respects with that of the railways.

The improvement of navigable water-ways necessarily includes that of seaports, without which our canals and rivers would be incapable of being fully developed. All merchandise passing into and out of the country must pass through the ports. The ports, therefore, must keep pace with the movement of commerce, follow the development of traffic and maintain the struggle with foreigners.

Indian Irrigation Works.

In Lord Salisbury's despatch to the Governor-General of India there is the following paragraph: Very much stress has been laid from time to time upon the financial and other advantages to be derived from expenditure on these works, and during the past autumn the construction of them in the Madras Presidency upon a vast scale has been strenuously urged. The fact that demands of this kind have recently been made by persons of authority would of itself suffice to make a searching investigation of the question highly expedient. If there is room by such undertakings materially to relieve the Madras people from so much suffering, and the Indian treasury from an intolerable burden, the construction of the works ought to be commenced with the least possible delay. If, on the other hand, this resource is not to any great extent available, and any such undertaking, on the contemplated scale, would only impose fresh burdens on the taxpayers, without effecting any notable diminution of the evil, it is of high importance that the evidence of that fact should set forth with sufficient fullness and cogency to dissipate all illusion upon the subject. In the reports which your Excellency has forwarded me from time to time, I find much to lead me to believe that the very cause which produced the famine in many cases has made irrigation works wholly or partially ineffective. The same want of rain which parched the fields, emptied the tanks, and lessened the volume of the rivers. The absence of glaciers in the hills of Southern India would naturally render the irrigation canals far more liable to be affected by want of rain than similar works in the valleys of the Ganges and Indus.

Replying to a letter from Mr. E. Jenkins, M. P., Mr. Burke, Secretary of the Indian Irrigation Society, wrote as follows: "Most of our committee are of opinion that a judicious extension of irrigation canals is one of the urgent wants of India, and as regards Sir Arthur Cotton, although all the other members of our committee do not necessarily go as far as he does, he can scarcely be called a mere 'theorist' even by those who do not agree with him, inasmuch as he himself constructed the two most practically successful irrigations works in India—the Godavery and the Tanjore canals—which are paying, according to the government returns, not less than 86% and 21% per annum respectively on the original outlay."

THE IMPROVEMENT OF THE MISSISSIPPI.—We have already described the proposition of Mr. Eads to improve the navigability of the great river for more than a thousand miles of its course. It seems that other propositions are also considered. The St. Louis *Journal of Commerce* says: The Committee on Levees has before it another bill, which the Southern members are urging forward, and it was thought best not to intrust the interests of this matter in their hands. They preferred, therefore, to have them left with the Committee on Commerce. A bill was introduced by Mr. Knapp, of Illinois, which embodied all the desires of the St. Louis Committee, and it is now pending. A fact in favor of the bill is that it harmonizes with the work already accomplished by the Government engineers, and, when the improvement is once begun, it will not be difficult to secure further appropriations to advance the work until it is completed. The entire appropriation expected for internal improvements will not exceed \$6,000,000, so that it would be useless to ask anything like the amount required by Capt. Eads' plan, which would require at least \$40,000,000. It is true, said Mr. Brown, that Capt. Eads accomplished a great work for

the West when he opened the jetties, but he has still much to do before it is completed, and if it required \$5,000,000 to improve two and a half miles there, what would it cost to improve 1,200 miles? Mr. Brown feared that Senator Cockrell's hills was a waste of time, because it provides only for doing work that has already been done by Government engineers, and would delay any improvement for two years. What is wanted, therefore, and what, in Mr. Brown's opinion, is the thing to be done, is to push Mr. Knapp's bill, and, if possible, secure its passage the present session, and thus get an appropriation for immediate work.

FRENCH RAILWAY SYSTEM.—M. de Freycinet's great railway scheme for the interior of France is occupying a good deal of attention just now. He estimates that to complete the net work required for the development of the country, 16,000 kilometers of railway iron has to be constructed. Estimating the average cost at 200,000 francs per kilometer, which will entail a total expenditure of three milliards two hundred millions, he thinks that at the rate of 320,000,000 a year the country will be able to complete the whole in 10 years. The *Journal des Chemins de Fer* considers the scheme rather visionary, and subject to so many vicissitudes as to be impracticable. The *Moniteur des Interets Matériels* thinks differently, looking at the enormous vitality and resources of France, and considers that the minister is taking a broad and patriotic view of French economies which will be justified by the result.

More About Woodward's Gardens.

A late issue of the PRESS gave a cut and an outline sketch of Woodward's Gardens. We propose here to give an additional description in general, without, however, going very fully into details.

As regards location, they embrace two squares between 13th and 15th, Mission and Valencia streets, and can be reached from the business part of San Francisco by the Mission or Market St. cars, the former taking visitors directly to the front entrance. The dense hedge of Monterey cypress, some 20 feet high and 400 long, screening this front, is itself an attractive sight.

Its various departments may be summed up as follows: 1. Natural History; 2. Botany; 3. Mineralogy; 4. Art—including Ethnology and Numismatics; 5. Amusements and Entertainments.

These we shall describe, in brief. 1. The department of Natural History includes some of the rarest living animal specimens of quadrupeds, fishes, reptiles and birds. These are kept in fine condition in the open air within strong cages, or roomy enclosures, pits, pens, sheds, aviaries, ponds, running stream and lake, and the marine and fresh-water aquarium, the latter constructed and kept under the supervision of Mr. C. Schuman, and certainly one of the largest and most complete to be found in the United States. This department is also represented by most of the numerous, well prepared and arranged specimens in the museum proper, and in three other buildings. The huge skeleton of a whale which was 75 feet long, is one of the curiosities in the inner garden. 2. The department of Botany embraces many rare and beautiful trees, shrubs, trailers, flowers and grasses, distributed in good taste throughout the finely improved grounds, along the artificial lake and stream, and upon the rock-work, where the large fountain tosses its handsome jets. It includes the conservatory with its neat rotunda, for palm trees, bananas and other tall tropical growth, and the tropical green houses—all well filled with curious and exquisitely beautiful hot-house plants; the fern-house, full of those delicately-leaved, flowerless plants, from the giant forms of which in the early epochs of the world's history geology teaches us most of our coal-beds were formed. There are also well arranged specimens of the coarse and fine grained woods of the Pacific coast in the museum.

3. Mineralogy. This comprises, besides many minerals of the Pacific coast, Prof. Kaderly's large and valuable collection from Japan. 4. Art. This includes—besides many unique and artistically finished structures among the buildings beautiful pieces of marble statuary, placed at various points throughout the grounds and buildings; the attractive art gallery, where the eyes can be feasted with a truly meritorious and varied collection of oil paintings, old and new; also polytechnic hall, to the former attractions of which is being added a large *Zoographicum*, an invention of Prof. F. Gruber, consisting of a wheel over 12 feet high and 24 in diameter, turning on a vertical axis, and displaying with its eight divisions in succession, characteristic and instructive scenes of the different continents, giving Arctic, Tropical, Semi-Tropical, and South Pacific Island views—all studiously true to nature; then the camera obscura, where for a small extra charge, a fine view in miniature can be had of the living, active scene around you, in the gardens and adjoining parts of the city; and finally the sculptor's studio, with its models of the colossal bust of Washington and other figures, a great attraction being that the process of modeling can be witnessed.

The ethnological collection consists chiefly of weapons and other implements from most of

the South Pacific islands, and the division of numismatics comprises numerous coins, medals, and casts of seals, extending from times of ancient Rome to the present.

5. Amusements and Entertainments. These are varied and the best of their kind. Besides daily and special entertainments in the huge pavilion, music hall and restaurant, there are exercises and amusements in the open air. In the first garden is the rotary boat, propelled by oars and three schooner-rigged sails in its pretty circular lake. It forms the outer rim of a huge wheel some 40 feet in diameter, resting on the surface of the water, is itself three feet wide, and will seat about 100 persons. When filled with merry boys and girls, and whirling steadily in its place, on a bright sunny day, it is a beautiful sight. In the second garden, where most of the animals are kept, are swings and gymnastic poles of various kinds, two stylish little carriages drawn by goats, the rare and royal fun of rides on camels and donkeys, and inventions for testing strength. A fine balloon ascension is occasionally made here.

Part of the indoor entertainments are permanent, but many of the exhibitions are constantly changing. The pavilion, built on the highest ground in the first garden, will seat over 5,000 people. The floor of its amphitheater is 90x120 feet and forms a fine skating rink. There daily visitors can get roller-skates and skate to their heart's content.

Saturdays and Sundays and other holidays there are special performances from 1 to 4 P. M. Besides the finest of music by Wetternau's hand and the orchestra, the best troops and special artists that visit San Francisco, including trapeze performers, acrobats, jugglers, rope-dancers etc., are engaged from time to time.

Suffice it to say, that these performances, like every other curiosity in these justly noted gardens, are always the very best known in their several departments.

It is admitted by all that every one, old or young, is the happier and better informed for spending a day occasionally in Woodward's Gardens.

Mining Mortality.

Statistics lately compiled show that of the deaths that occurred in mining in Great Britain between 1850 and 1860, 29.36%, or about one-fifth, were due to fire-damp explosions; 30.87%, or about two-fifths, were due to falls of the roof and sides of the mine; 17.24%, or less than one-fifth, were due to shaft accidents; and 22.53%, or more than one-fifth, originated in miscellaneous causes and accidents above ground. In the first 10 years after the inspection of coal mines was instituted, in 1859, the total number of deaths was 9,090 from all causes, being within 1,000 of the total number of deaths that had before occurred in the entire history of British coal mining. On the face of it this seems either to vitiate entirely the estimate that only 10,000 deaths occurred up to 1859, or to prove that neither the appointment of inspectors nor all the accumulated and valuable resources at the command of the mining engineer have been able to reduce the fatalities among this class of miners. Brought down to a later period British statistics show that during the 15 years ending with 1875, 15,908 lives were lost in raising 1,608,576,193 tons of coal. In that country the ratio of deaths to tons of coal raised were, in 1874, 1 to 133,251 tons; in 1875, 1 to 118,730 tons.

In the Schuylkill coal mines, Pennsylvania, the ratio of death to tons of coal raised were, in 1874, 1 to 66,126 tons, and in 1875, 1 to 86,207 tons, showing the fatalities in the American coal mines to have been nearly twice as great as in the English.

UTAH NORTHERN RAILROAD.—The Spring terminus of the Utah Northern railroad will be situated about six miles northwest of the place where the road crosses Bear river. The Montana freight teams are expected to get their second loads at this terminus, and in the meantime the railroad will be pushed forward into Marsh Valley, to a point where the Montana wagon road crosses Marsh creek, near the southern boundary of the Ross Fork Indian Reservation. Parties who think they can divine the inscrutable purposes of Jay Gould, say that the extension of the Utah Northern is only a scheme to throw cold water, as it were, over the Northern Pacific project, so that Gould may the longer enjoy the Union Pacific monopoly. Hence, the diviners conclude the Utah Northern will be extended only as far as Snake river, at which point the terminus will be fixed, at least for a number of years. If they are correct in their surmises, this Corinne of the north will be on or near the Ross Fork Indian reservation, which fact may result in trouble between the noble red man and his aggressive white brethren. But the military authorities, we are reliably informed, have strongly recommended the removal of the Bannock Indians from this reservation and the restoration of the country, now included in the reserve, to the public domain.—Salt Lake Tribune.

Of the bright har that once practiced in White Pine the Sentinel gives the names of those who have ceased to live, as follows: Ashley, DeLong, Perley, Pitzer, Bryant, Darrow, Foster, Frank and James Kennedy, Graves, Musser, Allen and Simms.

NEW mines have been discovered two miles north of the Red hills, in the Paradise mountains, Nevada.

USEFUL INFORMATION.

Amendments to the Game Law.

The killing of quail, partridge and duck is prohibited in San Bernardino and Los Angeles counties between the 1st of April and the 1st of August; and in other counties except Lassen, Plumas and Sierra, between the 15th of March, and the 15th of September. The killing of doves is prohibited in San Joaquin county between the 1st of January and the 1st of July.

The gathering or destroying of the eggs of any species of wild duck is made a misdemeanor. The killing of any male deer between the 1st of November and the 1st of July is prohibited.

The killing of any antelope, elk, mountain sheep or female deer is prohibited for four years from the passage of the Act.

The killing of spotted fawn at any time is prohibited.

The killing of any animals mentioned in the game laws, except for use of food, is a misdemeanor. This clause is designed to prohibit the poisoning of game animals.

The taking of any species of trout is prohibited between the 1st of November and the 1st of April.

The taking of salmon is prohibited between the 1st of August and the 15th of September, and also between sunrise on Saturday and 12 M. on the following Sunday through the year.

The taking of shad is prohibited between the 1st of April and the 31st of April and the 31st of December.

Fish of any description can be taken at any time with hook and line in the tide waters.

Traps and other permanent contrivances for catching fish in any of the streams or sloughs are prohibited.

Nets may not be used, except for shrimp fishing, with meshes of less than one and one-quarter inches. Nets may not extend more than one-third across any stream or slough.

It is required to return to the water all the young of fish, or fish too small to be marketed.

The penalty of violating any provision of the law is a fine of not less than \$5, nor more than \$300, or imprisonment in default. One-half of all fines collected goes to informers and half to the District Attorney. All nets and apparatus illegally employed may be seized and sold, and one-half of the proceeds will go to the person making the seizure, and the other half to the school fund. All nets with meshes under size will be destroyed.

The Act is already in force.

An Original Metric System.

It seems that Congressmen are doing something on their own hook in the metric line. A bill, introduced by Representative Stevens, of Georgia, to promote the general use of the metric system, authorizes the use of the modified metric system and the continued use of any system permitted by law is not prohibited, the true intent and meaning of the act being not to enforce any particular system, but to provide for the public convenience by adaptation to its circumstances and exigencies, the metric system being capable of indefinite expansion to suit the uses of mankind in business and science. The following are the metric tables as proposed by the bill:

Measures of Length—100 hairs make a nail, 100 nails make a meter, 1,000 meters make a kite.

Measures of Surface—10,000 square meters make a great acre.

Measures of Bulk and Capacity—100 drops make a spoon, 100 spoons make a quart, 100 quarts make a cask.

Measures of Weight—100 seeds make a corn, 100 corns make a nut, 100 nuts make a hi-pound or bip, 1,000 hips make a ton.

MOTHS IN CARPETS.—The carpet moth makes his favorite home about the hindings and corners of the carpet. If this is an ingrain or three-ply fabric, successful war may be waged on him by wringing a cloth out of hot water, laying it over the hindings and edges, and ironing with as hot an iron as can be used without scorching. This will destroy both the moths and their eggs, and after a few such visitations they disappear. But this steaming and ironing process is not effectual with Wiltons, Moquettes, or any heavy carpetings. The heat cannot thoroughly penetrate them, and ironing injures the pile of the velvet. Still, it is best to draw the tacks occasionally, and lay the edge of the carpet over one side only, or a part of a side, at a time—and steam and iron it on the wrong side. Then, beside this, the floor should be wiped as far under as the arm will reach with a cloth wrung out of strong and hot Cayenne tea; and before re-nailing, the binding and edge of the carpet should also be wiped with it, rubbing them hard. Some have recommended sprinkling salt round the sides of the room before nailing down the carpet, but we should think this objectionable, as the salt absorbs moisture from the air and may thus cause too much dampness.

HARNES POLISH.—Take of mutton suet, two ounces; beeswax, six ounces; powdered sugar, six ounces; lamphack, one ounce; green or yellow soap, two ounces; and water, one-half pint. Dissolve the soap in the water, and add the other solid ingredients, mix well, and add turpentine. Lay on with a sponge, and polish off with a brush.

ENGLISH PAPER CARPET.—A description is given of a paper carpet now made in England, and designed to imitate parquet flooring, the paper being printed in patterns to imitate different woods from photographs, so that, as it is stated, the resemblance is absolutely perfect. The floor is first prepared, being made level, and the crevices filled up with plaster of Paris, over the surface, as thus prepared, lession is stretched, and, on this, first lining paper and then the patterned paper is pasted, the whole being finished with a coating of a peculiar kind of varnish, described as wonderfully hard and wear-resisting. This kind of carpeting can be kept perfectly clean with the greatest ease, and though the wear of paper carpeting may be thought problematical, the inventor states that he has had rooms covered with it for 16 months, without showing any appreciable signs of wear. Its appearance also is very satisfactory to the eye.

TO KEEP NAILS FROM RUSTING.—Heat a quantity of them on a shovel, and throw them, while quite hot, into a vessel of coarse oil or melted grease. The nails should not be so hot that the grease will be made to smoke freely. Cut nails prepared in this manner are improved in every respect. They are rendered tougher, and they will outlast any kind of wood, even though hurried in the ground; while unprepared nails are completely destroyed by rust in a very short time. Probably melted paraffine would be still better than ordinary grease, as it forms a very effective coating, penetrating the pores and preventing the access of air or moisture.

SOUTH AMERICAN TRADE.—Already Mr. Fralick, who went to South America as the special Postal Commissioner, has accomplished important results by his trip. He has secured the removal of the freight discrimination of \$14 a ton from Panama to Callao against American in favor of English goods, and he has also concluded an agreement with the Peruvian government for the establishment of postal communication with the United States under the Berné Postal Union.

RAT-PROOF PAINT.—Mix finely powdered glass with pitch or coal tar and rosin, and paint your grain bin with two coats, and it will be too much for rats' teeth. They don't like the tar, and the sharp glass is still more disagreeable.

GOOD HEALTH.

Color Blindness on the Railway.

Much interest has been excited of late by the discovery of an alarming prevalence of color blindness among railway operatives, to which is attributed many of the accidents growing out of inability to distinguish the color of signals. Mr. Thos T. Nelson, optician, of Chicago, makes the following contribution to the literature of the discussion: "From the first I have been accustomed to unite with the subject of color blindness that of quickness of perception, as I found in my experiments that very many not actually color blind were practically so from the sluggishness of their perceptive faculties, and I also found some who were unable to distinguish colors at certain distances, varying more or less in individuals, as well as some who were color blind at night and not in daylight, and vice versa. I have also considered with these defects, under the onegeneral head the optical defect called 'Myopia' generally known as 'near-sightedness,' and another defect called 'Astigmatism,' both or either of which exist to a greater or less degree in a large percentage of population, and in a majority of cases not suspected. Tablets and charts are not entirely practical except for day tests, since the results obtained with reflected light are quite different from those obtained when direct or transmitted light is used, and in practice the most important test in railway service is certainly that which insures the greatest safety at night. There are other questions constantly arising, among which is that of the circumstances under which color blindness may be acquired, but in the absence of records of individual cases kept for a period of time, this must remain a question for further investigation. My facilities for determining to any certainty just what part defective vision has had in railway accidents, has been very inadequate, the reticence of railroad companies upon the subject of accidents not being conducive to thorough investigation; hence I am compelled in a great measure to reason by analogy, but I have no doubt that in many instances of blunders or mistakes which are usually attributed to carelessness or recklessness, where defective vision could enter as an element, investigation would show that it was the prime cause of the accident."

Metal Grinders' Consumption.

A correspondent writes to the Iron Age that nothing is so common among nailers of late years as what is known as nailers' consumption. The rate of mortality from diseases of the lungs, superinduced by dust from the grindstones, is positively fearful. A post-mortem examination, held on the body of G. W. Johnson, of Wheeling, who died a short time ago, which was published in the daily papers, furnished a full description of this so-called 'nailers' consumption.' An attempt has been made in some of the nail manufacturing to prevent dust from circulating by introducing powerful fans, with

a series of pipes by which the dust is carried off through the fans by exhaustion. Now this is all well enough, so far as it goes, but the fans do not, nor is it possible for any known mechanical appliance to remove all the dust; hence sufficient dust remains floating in the atmosphere to kill in a short time persons whose respiratory organs are not of the most healthy and durable character. Most particularly is this the case with nailers. Devices, such as a moist sponge worn over the nose and mouth, fail to prevent the complaint. Our correspondent recommends a false mustache so constructed that it would fit neatly round the outer rim of the nose, extending down below the chin on those who have no beard, or correspondingly to those who have. A slight gum elastic string would hold it on without disagreeable feeling. Any hair not too coarse would answer the purpose. Such an appliance would not disfigure the face, could be easily adjusted, and would save many a poor fellow from an untimely grave. If any one will take the trouble to look at a hair under the microscope, he will see how nature has constructed it for his purpose. A feather is a very good illustration of a hair, with its thousands of barbs all pointing the same way, catching and holding all floating particles that are drawn toward the nostrils by inhalation.

ANTIDOTE TO SNAKE BITES.—On the subject of snake bites, a very interesting communication has lately been received in India from an American gentleman, Mr. Kosciicky, recommending the gall of rattlesnakes as an antidote for snake bite. Mr. Kosciicky, who became acquainted with the antidote at Venezuela, states that it is not only cheap and infallible, but instantaneous and wonderful in its effects; crows and dogs in the last stages of the poison recovering as soon as the remedy was administered to them. The preparation of the antidote is simple: Three rattlesnakes' galls put into an ordinary wine bottle filled with 30° spirits, and allowed to stand for a week. In ordinary cases one or two tablespoonfuls are taken; in extreme cases, three to six. Mr. Kosciicky recommends experiments being made in this country with other snake galls. Dr. Fayrer agrees with this recommendation, and refers Mr. Kosciicky's letter to the committee at Calcutta for investigating snake poison. The idea, however, he says, is not a new one, for in the "Thanatophidia of India" the result of an experiment with the antidote is recorded; and he is of opinion that when brought to the test of scientific investigation, it will not prove more successful than the many other "antidotes" which have hitherto been tried and have failed.

AMERICAN WOMEN.—American women, says Harper's Bazar, take vastly better care of themselves than formerly. They have more acquaintance with hygienic laws, and hold them in far higher esteem. The days when they exposed themselves to dampness and wintry cold, in thin slippers and silk stockings; when they abstained from flannels next to the skin; when they pinched their waist to semi-suffocation; when they sacrificed comfort and health to what they conceived their appearance—these foolish and unhappy days have gone forever, have barely been known to the rising generation. Our women have no mawkish and morbid notions as to themselves; they no longer think that to be unhealthy is to be attractive; that invalidism and interestingness are synonymous; that pale faces and compressed lungs are tokens of beauty. They dress seasonably; they wear thick boots and warm clothes in had and cold weather; they allow themselves to breathe freely, and they find their looks improved, not injured by the wholesome change. There are exceptions—many of them doubtless—but the rule is as we have described, and the exceptions are constantly diminishing. It may be safely said that all sensible women are becoming, if they have not yet become, converts to nature, and that they heed her hehests, recognizing the great principle that what is not natural cannot be beautiful.

SCARLET FEVER BY MAIL.—A medical correspondent of the London Telegraph, a few weeks ago, gave the following account of such a case: "A lady residing in the country wrote to inform a friend in this neighborhood (East Sheen) that she was occupied in nursing her daughter suffering from scarlatina. The friend, after reading and burning the letter, gave the envelope in which it was contained to one of her children to play with. Ten days later I was requested to see the same child, when the diffused red rash over the skin, elevated temperature, and ulcerated tonsils clearly pointed to the nature of the malady with which I was called upon to deal. From inquiries that I have since made, I am satisfied that unless the disease originated de novo it could be traced to no other source of infection than the unfortunate envelope previously mentioned. Preventive medicine is always better than curative. I would therefore suggest that all communications not absolutely necessary written from an infected house be interdicted, and then when received, both letters and envelopes be immediately consigned to the nearest fire."

HOME-MADE COURT PLASTER.—The following recipe comes to us well recommended: One ounce of French isinglass; one pint of warm water; stir till it dissolves; add ten cents' worth of pure glycerine and five cents' worth of tincture of arnica; lay a piece of white or black silk on a board and paint it over with the mixture.

SUBSCRIPTIONS \$4 a year in advance.

SAMPLE COPIES.—Occasionally we send copies of this
paper to persons who we believe would be benefited by
subscribing for it, or willing to assist us in extending its
circulation. We call the attention of such to our pros-
pectus and terms of subscription, and request that they
circulate the copy sent.

THE ORIGINAL ARTICLES in this paper are mostly set in
solid type, giving in our columns one-third more reading
than is contained in ordinary leaded matter.

THIS PAPER will be supplied to the trade through the
S. F. News Co., No. 413 Washington Street, S. F.

BUSINESS LETTERS should be addressed to the firm.
Individual members are sometimes absent.

Our latest forms go to press on Thursday evening

SAN FRANCISCO:

Saturday Morning, April 20, 1878.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Foundry Notes; A
Steel Ship; The Winchester Repeating Rifle, 241. The
Week; Timber on Public Lands; Better Take to Mining;
Printing in the Patent Office; American and Foreign
Labor; The Savage, 243. Notes on the Black Hills;
Railway Brakes in England; An Improved Scrubbing
Machine; Mr. Blowers' Drying House, 249. Patents
and Inventions, 252.

ILLUSTRATIONS.—Winchester Repeating Rifle,
241. Stockley's Improved Scrubbing Brush; Blowers'
Fruit Drier, 249.

CORRESPONDENCE.—Bodie and Esmeralda;
From our Correspondent in the Black Hills; Notes from
Nevada County.—No. 2; Mining Notes from Siskiyou,
242-46.

MECHANICAL PROGRESS.—Vienna Bent
Woodware; Note on Boiler Making; Self-sharpening
Plow Share or Point; Locomotives Without Steam; De-
fective Engines; Chance for an Inventor; Coal as Armor
Plate; A New Corliss Engine, 243.

SCIENTIFIC PROGRESS.—Acoustical Phenom-
ena; The Youth of a Planet; Molecular Change by Vi-
bration; The Phenomenon of Hearing; On Sponges;
Bacteria at low Temperatures; The Electric Light in
Berlin, 243.

THE ENGINEER.—Mining Engineering School on
the Pacific Coast; Railroads and Water-Ways; Indian
Irrigation Works; The Improvement of the Mississippi;
French Railway System, 246.

USEFUL INFORMATION.—Amendments to the
Game Law; An Original Metric System; Moths in Car-
pets; Harness Polish; English Paper Carpet; To Keep
Nails from Rusting; South American Trade; Rat-Proof
Paint, 247.

GOOD HEALTH.—Color Blindness on the Rail-
way; Metal Grinders' Consumption; Antidote to Snake
Bites; American Women; Scarlet Fever by Mail; Home-
Made Court Plaster, 247.

MISCELLANEOUS.—More About Woodward's
Gardens, 246-47. Mining Mortality; Utah Northern
Railroad, 247.

MINING SUMMARY from the various counties
of California, Nevada, Arizona, Colorado, Montana
and Utah, 252.

MINING STOCK MARKET.—Sales at the San
Francisco, Pacific and California Stock Boards, Notices
of Assessments, Meetings and Dividends, 244.

NEWS IN BRIEF on 252, and other pages.

The Week.

The prosperous season continues. The rains,
which keep the crops growing and add to the
wealth of water for mining purposes, are also
bringing life to trade, and reviving influences
will follow in manufactures. The increased
productive effort naturally calls for materials to
do its work, and we look to busier times and
larger orders in all our wood and metal working
establishments. There is also a better feeling
pervading the community both with regard to
profit from legitimate enterprises and security
for investments already made. The discontent,
which was fanned into flame, among the unem-
ployed element in our population, is giving way
to a more sober tone of thought and action.
The increasing demand for labor is solving
questions which theory do not solve. This will
increase as the season progresses. There will
be a sharp call for laborers, business men
will dispose of their stock and capitalists will
regain confidence. The result, as we foresee it,
will be a firmer feeling in real estate and a
tendency toward improving buildings now
existing and erecting new. This will in turn
sharpen the saws in our forest mills and give a
ring to the hammer of the builder, which will
be heard throughout the State. We shall see,
as never before, that the true growth of our
coast depends upon honest labor and generous
encouragement of legitimate productive enter-
prises. If this lesson shall be well learned
this year it will not be the least valuable gift of
a generous season.

Timber on the Public Lands.

What is known as the timber bill, now pend-
ing in the United States Senate, is designed to
guard the forests on the public domain against
being cut down and used by lumbermen, as
heretofore, without any compensation being
made therefor to the Government, as well as to
preserve these forests against wasteful and
wanton destruction by any and all parties.
Some such legislation as this has for a long time
been needed, and it is to be hoped that the pro-
visions of the bill now under consideration will
be sufficiently stringent to secure the end pro-
posed. This bill allows the free use of all
timber necessary for domestic purposes, such as
farming, mining, etc., upon land not subject to
entry under existing laws, except for mineral
entry, or, in other words, upon mineral lands
belonging to the Government.

There is one feature of the bill, however, that
in its application to some of the mining districts
of the interior might work a hardship. This is
the clause which declares that no timber shall
be cut in the mountain regions within three
miles of the upper edge of the timber, commonly
known as the "timber line."

In so far as the wooded mountains of most of
the country on this coast are concerned, this
provision of the bill, should the latter become a
law, would be inoperative, inasmuch as the
forests extend to the tops of the mountains,
having a lower hut no upper timber line. This
clause has been introduced into this bill for the
purpose of preserving the timber along this
three-mile belt, as a means of guarding against
a too rapid melting of the snow, causing
freshets in the valleys below, this protection of
the snow on the higher mountains tending also
to prolong the supply of water in the streams
descending therefrom. This being its object,
the strips of country to be protected from
denudation should have been the summits of
the mountains, where these are timbered, as in
most cases they are. As most of the forest
lands west of the Rocky mountains extend up
to an altitude of 9,000 or 10,000 feet, there is
little need to protect their upper line against
the depredations of the lumberman.

In some parts of southern Colorado and New
Mexico, it is the case, however, that the timber
does not grow to anything like this altitude,
there being in those regions many mines far
above the upper "timber line." The most of
the mines there are, in fact, situated above that
level, and should the miners be debarred from
cutting timber along the belt proposed for reser-
vation, they would be practically estopped from
developing their claims, as they could not well
haul their wood and lumber up the mountains
for so great a distance. Whatever the utility
of the proposed clause in other cases, these sec-
tions of country ought to be excepted from its
operation, the forest here being, as a general
thing, much scattered and affording but little
protection to the snow.

We do not think there is much force in this
argument anyhow, and in our own experience
know of but a single instance where a reser-
vation of this kind would be of much practical
advantage, and in this instance there is no up-
per, though there is everywhere a very sharply
defined lower "timber line," we allude to the
easterly slope of the Sierra Nevada, or at least
that portion of it that is being stripped of tim-
ber to supply the Washoe miners. The denuda-
tion of the mountain here allowing the snow
to melt more rapidly than it otherwise would
have done, thereby causing freshets in Carson
river during the early summer, and leaving it
with less water than it formerly carried later
in the season, to the great detriment of the
mills dependent upon that stream for their pro-
pulsive power.

There is one peculiarity of the principal
mountain forests on this coast that in the con-
sideration of this question of timber preserves
has not been kept sufficiently in view—and that
is their wonderful power for self-renewal. The
coniferous tracts of the entire Sierra Nevada,
when stripped of their timber, are at once cov-
ered with a vigorous growth of young trees,
which, when protected against fire and other
destructive agents, come along so rapidly that
they are large enough to be cut for saw logs in
the course of 25 or 30 years, yielding meantime
immense quantities of posts, poles and firewood
under the thinning out process, for they grow
up so thickly at first that many, unless cut out,
must necessarily die before they reach any great
size. However much we may require tree
planting elsewhere, nature will attend to the
work of forest reproduction in these mountains
if only we give her a fair chance to do so.

BANK OF CALIFORNIA.—At the last meeting
of the Directors, Hon. William Alvord, on
resignation of Mr. Mills, was chosen President
of the Bank of California. The selection is
eminently a proper one. Mr. Alvord has served
the bank well as Vice-President. He has dis-
charged, with great credit, several high public
trusts which have been committed to him by
the citizens of San Francisco. He is a man
whose integrity is unquestioned, whose ability
is universally recognized. The bank has done
well for itself and for the community in its
choice of President.

It has been decided by the courts that a ma-
chine temporarily disused under circumstances
connected with the supply or demand of its prod-
uct, and independent of the efficiency of the
mechanism is not an abandoned experiment.

Better Take to Mining.

More of our young men and boys should be
trained up for mining pursuits. This, when
rightly followed, will yet prove to be the best
business on this coast. It will hereafter be at-
tended with fewer failures, for the reason that
there will be fewer mistakes than have charac-
terized it in the past. The experience of a gen-
eration will insure for it in the future more cer-
tain as well as larger average rewards. It is a
business that should prove attractive to our
youth. There is in it enough of exertion and
excitement to gratify the fondness for action and
the love of adventure natural to the young,
while in its large possibilities the chances for
making money are especially good. To qualify
a young man for pursuing this calling in a suc-
cessful and intelligent manner demands less
time and money than would be required to fit
him for any of the mere mechanical vocation,
and not half as much as would be necessary to
prepare him for either of the so-called learned
professions.

While it is true that the more education he
has the better, it is still the case that the miner
can get along with a comparatively small
amount of book learning. Suppose a lad any-
where along from 16 or 18 to 25 years of age to
have a common school education, if it is in-
tended to make him a miner, let him first take
a course of lessons with a good practical as-
sayer, learning how to assay for all the more
common metals, and also the use of the blow-
pipe thoroughly. If afterwards he has the time
and means to follow this up with a course of
lectures in chemistry and mineralogy, so much
the better. But if not, let him now go forth
into the mines provided with a miniature assay-
ing apparatus, or a blow-pipe, at least, and en-
gage in prospecting. If his necessities are such
that he must earn something from the start,
then let him go to work as a common miner.
While working for wages he will gain a prac-
tical knowledge of this most essential branch
of the business, enabling him to do it himself, and
to judge when it is properly done by others.

With his ability to test ores he will be all the
while exercising himself in that way, the ex-
perience of the older miner, with his practiced
eye, being of great service to him in learning
the geology of the various formations and in
enabling him to readily detect the presence of
ores and such other signs as are apt to arrest
the miner's attention. The young man so
qualified, even if he have to work for wages at
the outset, will not be long in advancing him-
self to a more responsible and better paying
position, and finally acquiring proprietary in-
terests should he feel inclined to do so.

If he can assay well and have the necessary
outfit, he will find many opportunities for doing
the assaying for large companies as well as for
establishing himself in the business at some
active mining center and doing custom work.
If he follows the life of a prospector then the
advantages of being able to test such rocks and
ores as he may come across are too manifest to
require any argument, the blow-pipe alone in
the hands of an expert, being ample to deter-
mine the character of samples in the field with
sufficient exactness. The entire cost of such a
course of instruction as is here indicated, with
necessary outfit, would not exceed two or three
hundred dollars, the instructions along not
more, perhaps, than a hundred, the time re-
quired being from two to four months. There
are a number of first-class assayers in this city
who hold themselves ready to give instructions
in this art and who are too careful of their own
reputation to suffer their pupils to leave with-
out being well up in their calling. The busi-
ness places of some of them can be found by
looking over our advertising columns.

Printing in the Patent Office.

We have received a circular from the U. S.
Patent Office, making an announcement that as
the appropriation made by Congress for printing
and binding for the Patent Office has been ex-
hausted, the *Official Gazette* will not be issued
as usual for a while, and the printing of speci-
fications has also been suspended for the same
reason. The suspension will probably be only
temporary, as a deficiency appropriation bill is
now pending before congress.

In view of the fact that the Patent Depart-
ment of the Government, which is financially
productive, and in truth the only one which is
self-sustaining even, it seems rather unjust that
its business should be suspended for want of
money. Not that there is no money either,
because the department has nearly a million
dollars surplus earnings tied up with red tape
somewhere which is "not available."

It is most assuredly due to inventors of the
United States, to whom a great deal of our
prosperity is attributable, that the business of
the Patent Department should move smoothly
and not be retarded by legislation in any way
whatever. Matter accumulates so very rapidly
that when the printing once gets behind, it is
extremely difficult to catch up again. All this
works hardship to inventors who pay their
money into the office and expect something for
value received. We hope that such a thing as
this will never be allowed to occur again, but
probably all we can do at present is to relieve
our feelings by a slight grumble at the powers
that be.

American and Foreign Labor.

This distress among the working classes in
certain parts of the United States is looked
upon by many as in some way the fault of the
country or its legislators, although they have
only to look elsewhere abroad and they will see
the same condition of affairs. The iron work-
ers and colliers of the north of England and of
South Wales, and the miners of Cornwall are
all in a deplorable condition. France is not
suffering quite so severely, but her working
people have very little to be satisfied with in
their surroundings. In Belgium wages are low
and employment scarce, and in Germany trade
has been more or less depressed ever since the
war.

Regarding the causes of the distress of the
laboring population in England the London
Mining World says that furnace after furnace
has been put out of blast, colliery after colliery
has been shut down, and as for the tin and cop-
per mines that have ceased to work in Cornwall,
their name is legion. No adequate effort has
been put forth to relieve these people except in
individual cases.

No better idea could be furnished to the state
of matters than the few following figures which
we quote from the *World*: "Whereas common
engine coal in 1872-3 fetched at the pit's mouth
7s. 6d. per ton, to-day we question if it realizes
so much as 2s. 6d. Ordinary pig iron bars at
the works sold in 1872-3 for 6l. and 7l. per ton,
which now only realize some 45s. or 50s. Staf-
ordshire hars also, which in 1872-73 realized
16l., hardly fetch half that now, whilst the best
Bessemer rails, which realized 16l. 10s. per ton
in 1872-3, are hardly realizing 6l. 10s. to-day.
Under the great reduction of wages which these
prices have entailed, and when we remember
that so many works have been closed altogether,
it is not surprising that there is such acute dis-
tress prevailing over so large a portion of our
country."

Notwithstanding these facts, the *World* thinks
the English working man may congratulate
himself on his position as compared with that
class on the continent. Here we have still
further cause for congratulation, for there is a
large area of territory still uncultivated, thou-
sands of acres of mining land still unprospected,
and if our laboring classes choose to avail them-
selves of the opportunities offered to them out
of the cities, they will always be able to find
an opening.

The Savage.

Last Saturday, the east drift, being run on
the 1640 level of the Savage mine, passed first
into a very soft, favorable character of porphyry,
then a heavy clay wall, three feet in thickness,
beyond which a vein of good clean ore, but lit-
tle mixed with the surrounding material, was
encountered. The drift was driven into the
ore three feet, the ore showing the entire width
of the drift. Drills were then driven into the
ore four feet further, showing it to be about the
same as what was in sight.

This, says the *Gold Hill News*, is an entirely
new ore discovery and lies east of any prospect-
ing ever done in the mine below the 1300 level.
On the 1600 level, Mr. Lon Hamilton, while
Superintendent of the mine, two or three years
ago, ran a drift 250 feet east from the north
and south lateral drift, at a point 200 feet south
of the Gould & Curry line, but did not reach
the range of the new development by at least
300 to 400 feet. The new vein has a course 23°
east of north, and as nearly as can be deter-
mined by the little work that has been done on
it, a dip of about 60° to the eastward. The ore
is the genuine Comstock sulphuret, the quartz
being of the liveliest and healthiest character.
It assays from \$15 to \$100 per ton and will
probably average \$40. The drift was at once
stopped, and General Williams, the President
of the company, was telegraphed in San Fran-
cisco, but he being too ill to come up, Superin-
tendent Gillette has gone to San Francisco to
receive instructions what to do. The drift, in
the meanwhile, is being enlarged and timbered,
preparatory to starting drifts both north and
south along the west side of the ore vein.
When these drifts have reached a proper dis-
tance, crosscuts will be run to ascertain the
width and value of the ore. As soon as these
drifts are fairly started it is likely that the
main east drift will be again advanced. The
east drift on the 2000 level is still drifting vig-
orously forward, the face in a much softer,
kindlier character of porphyry than it has be-
fore encountered since it was started. It is
believed that this drift will not have so far to
run eastward as that on the 1640 level to strike
the new vein, as the slope of the main incline
to the eastward is very rapid.

THE SUTRO tunnel is steadily advancing from
the eastward toward the heart of the Comstock,
and in a few months or weeks must be met by
the drift east on the 1640 level of the Savage,
which is being run for the purpose of meeting
the Sutro tunnel, as well as of exploring the
ground of the company in that direction.

THE connection between the Yellow Jacket
and Crown Point mines on the 2000 level has
been completed. This is a very important con-
nection, giving much needed ventilation, and
greatly improved facilities for working both
mines at that depth.

Notes on the Black Hills.

From an intelligent and reliable mining expert, who, after a somewhat protracted stay, has just returned from the Black Hills, we obtain some information in regard to the mineral deposits and the industrial aspect of affairs in that region. As our informant confined his observations to Deadwood and vicinity, our remarks are to be accepted as applying to that locality mainly. Summarizing this information, it appears that the strong features of this section of the country consists in the large quantities of low-grade gold-bearing quartz that can here be mined and milled at a comparatively low cost. This quartz, a pure silica, bears a dark reddish tint, resembling that found at certain localities in California. The dominating mineral belt of the district, which is made up wholly of this material, bears generally north and south, shows strong surface exposure, and is clearly traceable at this point for a mile or more. At some places along it this lode has an ascertained width of over 200 feet, and nowhere is it less than 50 or 60 feet across. While its transverse dimensions have not at any point been fully determined, it will probably be found, when thoroughly exploited, that it has, as a whole, an average width of not less than 150 feet.

The deepest explorations yet made here are on the Father de Smet claim, which has been sunk upon to a depth of 175 feet, and cross-cut for a distance of more than 200 feet, the excavations made being wholly in ore. In this mine, what is considered the east country, a talcose rock, has been reached, but nothing looking like a wall has yet been encountered on the west.

After extensive milling operations it is found that this ore, taken out in bulk, and without assorting, yields under the stamps from \$7 to \$15 per ton—or, taking a more narrow range, from \$8 to \$12, a fair average being about \$10 per ton. The gold occurs in the ore free and can be saved up to a close percentage by the most cheap and simple methods of reduction employed in California. The cost of milling and mining the ores here will not, for the present at least, exceed five or six dollars per ton. Should the cost of extraction and the difficulty of treatment be hereafter increased, this will be more than offset by the reduced prices of supplies and labor. While the early occurrence of such difficulties is not apprehended, the cost of labor and material must very soon undergo a marked reduction, prices of everything coming down to the Eastern standard. Just now the prices of labor are rather high, owing to the cost of subsistence; nearly everything required for the sustenance of the population, after long railroad carriage, being subjected to more than 200 miles of expensive wagon transportation. The latter, however, it is expected will be superseded in the course of a year or so by the construction of the narrow gauge railroad now in contemplation from Cheyenne to Deadwood. The only class of laborers from this Coast who would stand much chance of getting employment at fair wages, or he likely to feel at home in the Black Hills, would be underground miners, very few of the newcomers from the East being sufficiently expert at timbering to answer well in this department of the business.

While the mines on the main mineral belt at Deadwood will no doubt prove to be good paying properties, and others, perhaps, equally good will be found elsewhere in the country, there will open here beyond any question a broad and prolific field for wild cats; the prospectors, swarming like locusts, being bound to take up everything bearing the remotest semblance to a ledge, however far from wood and water, or however worthless.

Of the prospects for placer mining in that region, our informant entertains but a moderate opinion. The gulches about Deadwood are already pretty well exhausted. There are banks of auriferous gravel of sufficient extent to warrant the undertaking of hydraulic washing, some operations in which are contemplated. The most serious trouble threatened in this branch of mining, will be lack of sufficient fall to prevent the troublesome accumulation of tailings. Several parties, among them a strong California company, have projected ditches to bring in water for hydraulic purposes, some ditches having already been constructed for this and other objects. The water about Deadwood is hardly fit for drinking, or other domestic uses, that running in the gulches being contaminated by the dead timber about their sources, and the tailings from the quartz mills. A ditch is being built to supply the inhabitants with a purer article.

From the foregoing it will be seen that there is not much in this Black Hills region to commend it to the favorable notice of the average California miner. It costs something over \$100 to travel from San Francisco to Deadwood, the mining center of that country. The cost of living there is great; labor, with the exception mentioned, is not easy to be obtained at any price, and the rate of wages will soon be reduced below the California scale. Though the present has been rather a mild one, they usually have severe winters there—deep snow with strong winds and intense cold. They had in the latter part of March a heavy fall of snow, accompanied with such gales of wind as are experienced only in the higher mountains of California. The summers are hot with much thun-

der and lightning, the climate, from all we can gather, being one not at all likely to suit those who have long resided on the Pacific slope of the continent.

Railway Brakes in England.

We see by an item in *Iron* that the Amalgamated Society of Railway Servants has issued an appeal to Parliament and the public setting forth certain grievances of theirs, the principal one being that their lives are endangered by the companies delaying to an unreasonable time the application of continuous brakes. For want of these, minor collisions frequently occur, but attract no attention from the public unless several lives are lost. The railway servants engaged in working the traffic of the lines number 120,000, but as there are in the two houses of Parliament some 176 railway directors, the majority of whom can hardly be counted on as supporters of any movement to carry into effect the recommendations of the Royal Commissioner, made to Parliament over a year ago. Parliament is not likely to help the railway servants much.

It seems somewhat strange to us here to find,

STOCKLEY'S IMPROVED SCRUBBING MACHINE.

after it took so long for the English railway people to make up their minds to use the air brake, that they should be considered so essential that the men protest against working about the trains without them. It is strange, moreover, that having found out their efficiency, these brakes should not be universally used. The reason, probably, is that the directors are too parsimonious or the roads do not pay. This is no excuse, however, in the minds of the English people generally, and it is probable now that public attention has been called to the

supply of water, which escapes in divided form upon the brush, may be regulated. To the handle of the apparatus is secured a clamp for holding mop rags or cloths, as shown. When the machine is set in motion the valve, *F*, is opened by a nut on the short arm of a vertical rod striking against the shaft, *G*, as it reciprocates with the brush, and water from the tank is admitted to the sprinkler. A spring closes the valve when the machine is not in motion. A filter, *H*, serves to remove all dirt from the water as it passes to the supply pipe, and the

BLOWERS' PATENT FRUIT DRIER.

grievances of the railway employees, the directors will have to remedy them.

COPPER PRODUCT IN CHILE.—Mr. Henry Sewell, M. E., writes us as follows: "When I published the letter entitled the 'Future of Copper Mining on the Pacific Coast,' I stated therein that Chile, in 20 years, had produced values in copper as much as the Comstock had in silver and gold. In the *New York Engineering and Mining Journal* of last week the yearly and total production of copper in Chile for the last 20 years is given, the average being 43,000 tons of fine copper per year. The average price for the last 20 years has been \$400 per ton; equal to \$17,200,000 per year, making for these 20 years \$344,000,000."

CAPTAIN ARTHUR, of H. M. S. "Vernon," has reported to the Admiralty that a diver who was recently employed in moving some ballast, called out "pull me up" through a telephone just before he fainted. He did not signal with the rope but was heard through the telephone which he thanks for his restoration.

An Improved Scrubbing Machine.

The apparatus herewith illustrated is an invention for scrubbing and mopping floors, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Dr. A. F. Stockley. This new household implement is self-acting, the operator having merely to propel it. It heats its own water, projects the same in spray form, works a scrubbing brush, and finally applies a mop or wiping cloth.

A is a water tank of any desired size, the top of which is closed by a suitable cover, and which is mounted on a truck. Underneath is a box, *B*, in which the lamp or stove for heating the water is placed, the chimney passing through the tank and protruding above at *C*. At the front end of the frame is the scrubbing brush, to which a quick reciprocating scrubbing motion is imparted by the rock shaft, levers, and other simple mechanism, actuated by a pinion which gears with the wheel, *D*. This brush is so placed that it receives the entire weight of the front part of the machine. Connected with the forward end of the tank is a horizontal sprinkler, *E*, in the pipe leading to which is a valve, *F*, by means of which the

Mr. Blowers' Drying House.

The success gained by Mr. R. B. Blowers, of Woodland, Yolo county, in the manufacture of raisins which lead the market, has created a wide interest in his arrangements for drying. Last year we gave quite full descriptions of his methods and his own account of his success in producing a first-class raisin by using sun-heat if it was available, and if not, by putting the grapes through his drying house. It was also shown how he used the heat of the sun during the first stages of drying and finished the raisins by artificial heat. The fact is he has succeeded in producing a raisin by artificial heat which is so indistinguishable from his sun-dried, that they were all accepted together by the parties to whom he contracted the season's yield. He told these parties that they were only in part sun-dried, but they discerned no difference in them.

Mr. Blowers has used his drier for two years, and assures us that in that time he has cleared, above all expenses, more than three times its original cost, in drying raisins alone. His drier, including house, 42 feet square, with basement, furnaces, 16 drying rooms and 5,000 trays, having 19,584 square feet of drying surface and holding over 30 tons at one time, costs \$2,500.

Mr. Blowers has secured patents through the MINING AND SCIENTIFIC PRESS Patent Agency, and the small engravings on this page will give an idea of the construction of this drier.

Fig. 1 is a perspective view, showing the draft chimney, *E*, in the center, on the right and left of which are the furnace rooms, *D*. On each side of the furnace rooms and abutting on them are the drying rooms, *A*, taking the hot air from them at the top and again part way down (not shown in the cut); the door, *C*, is shown open, and the trays, *B*, arranged on cleats.

Fig. 2 is a transverse section taken across the heating and drying chambers. The right side shows the transom, *J*, open, and a lateral and downward moving current of heated air passing laterally in the flues (the flues being made by the solid bottomed trays, placed side by side on cleats), the downward movement being at the alternate ends of the flues, as shown by the cut. The air finally passes through the trap door, *L*, into the flue, *M*, thence into the draft chimney.

The left side of Fig. 2 shows the lateral and upward current. The downward moving current is used for fruit, vegetables, etc., and both upward and downward current for lumber. With this arrangement, it will be seen, an uninterrupted current of air is secured. In the first way with a downward pressure, drying the fruit on the trays thoroughly without turning, and in the second way with an upward pressure, drying lumber alike on both sides. It will also be seen that one room or up to 16 can be built on the same principle, but not with equal cost per foot of drying surface.

We have, in an article on the subject last year, so fully described Mr. Blowers' process of raisin drying that we need but allude to its advantages at this time. Like most all driers hot air is used, but in this, owing to the peculiar construction a very strong draft is secured, enabling him to dry in large quantities without condensation of moisture on the fruit farthest from the furnace. The result is that raisins retain the grape bloom. The capacity of the drier being very great, there is no necessity of dipping the grapes in lye or other preparation, to facilitate drying, and thereby injuring the bloom and aroma of the raisins. One feature in favor of the Blowers evaporator is that the grapes are picked on the trays in the vineyard and removed to the drier without further handling the fruit. Thirty tons can in this way be placed in the evaporator in one day. When the drying process is complete they are packed ready for market directly from the trays and are consequently unbroken on the stems, and, therefore, more salable.

Mr. Blowers has received a group of medals and rewards for his raisins and his apparatus, and his success in his raisin-making efforts has brought him both fame and profit.

REPORT OF THE UNIVERSITY ALUMNI.—We have received a copy of the able and very truthful "report on the practical character of the instruction given and benefits conferred by the University of California." It was made to the Alumni Association by a committee consisting of graduates Arthur Rodgers, Frank S. Sutton and E. A. Parker, who were appointed to examine and report for the information of the alumni. The report will strengthen the popular regard for the institution, because, abating the love and loyalty which alumni have for their alma mater, none are better able to judge of the practical benefits of an institution than those who have carried its influence with them into the walks of life. The report makes proper allusion to the college of agriculture, and bestows merited credit upon its wise and zealous promoter, Prof. Hilgard. We hope the report will be widely circulated and we may find space to present its points more fully hereafter.

The Bessemer medal of the Iron and Steel Institute of England, has been presented this year to Professor Turner, of Leoben.

mop clamp can be adjusted to either side of the handle arms, so as to run close to the side of the floor or surface which is being cleaned. The brush may be of any suitable size, shape or material.

This new household implement will be found very useful where large floors are to be scrubbed, in rooms or halls. The inventor, Dr. Stockley, is at present in this city, at 429 Bush street, where he may be addressed for further information.

PRINTING INK.—We hear cheerful testimony to the excellence of the printers' ink furnished us by Chas. Eneu Johnson & Co., of Philadelphia and New York. It is elegant material and may be fairly classed with the improvements which we made on our paper during the last year. Most files of newspapers will not stand the test of time, but turn yellow and show the spread of poor ink. This we escape by the quality of the ink we are using. We have uniformly good ink at fair rates, and this contains a hint worthy the notice of other publishers who may not be equally well served.

FINE RANCH FOR SALE.

LOWEST PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres,
Of which 640 are secured by Government title and the
balance by possessory title. It consists of

150 Acres of Rich Bottom Land,
Which is adapted to the raising of Wheat, Barley, Oats,
Potatoes, Corn, Vegetables, etc., and will raise as large
crops as any land in the county. There is 1,210 acres

of Fine Rolling Land which is A No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. The whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms,

On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,
Of the choicest varieties of Peach, Apple, Pear and Plum,
as well as a large quantity of Grapevines, Currant and

The owner has also about 40 head of Cattle, a few

The neighborhood is as good as could be desired, only about one mile from a store and one-half mile to a good school.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, and the crop bids fair to be worth when harvested, \$4,000.

Terms are \$8,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

GOOD LAND

— IN A —

FAVORABLE LOCATION,

GUARANTEERING

Sure Crops Every Year.

The Reading Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends some 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is very healthful and comparatively desirable. The near proximity of high mountain peaks give cool nights during the "beated terms" which occur in our California summers.

Soft well water—remarkably sweet, pure and healthy—is obtainable at a depth of from 15 to 35 feet.

Wood is plentiful and easy to get.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,
 Anderson, Shasta Co., Cal.

REGISTER YOUR TRADE MARKS.

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 20th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

putting in a windlass. The usual amount of 10 tons of ore is being daily extracted.

BAY STATE.—This mine is being worked to advantage and is looking well. They have made arrangements to commence shipping ore to the American Flag mill this coming week. Quite a lot of ore is on hand and good returns expected.

NATIONAL.—Will commence work on this mine about the first of May, as it will take until that time to prepare for work.

TEMPEST.—Are still sinking on this mine and making a good showing. Have reached a depth of 53 feet.

MAYFLOWER.—Have commenced sinking the main shaft of the incline again; intend sinking it 200 or 300 feet deeper.

Arizona.

MILLS RUNNING.—*Enterprise*, April 6: Mining matters throughout the Territory are in a very healthy condition. Mohave county's three mills are all the time producing bullion. Her Hackberry and Mineral Park mills will, in a short time, be running on rich ore. Yavapai county has four mills pounding away, and others that are being prepared for work. Maricopa has several mills running. So has Pinal county. Pima and Yuma counties are not behind, in the matter of mining development.

PECK MINE.—Mr. Robert Archer, who left the Peck a couple of days ago, says that the work of milling and mining was progressing in a satisfactory manner.

THE EMPIRE mine, near Ash creek, about 30 miles east of Prescott, which is owned by J. A. Lawrence and Jos. Chaudowine, is one of the best mines in that section. Mr. Blake today made four assays of rock from different parts of the ledge, which yielded as follows: \$973.95; \$197.91; \$182.20, and \$333.02; all silver. The owners have now a shaft 20 feet deep, which they are going to sink deeper. The ledge assays well for a distance of over 800 feet from the shaft. They were, this morning, offered \$12,500 for a one-half interest in the property, which offer they refused.

Colorado.

SPANISH BAR.—*Denver Tribune*, April 10: The late bad weather and mania for prospecting have retarded work here for some time past. A new cylindrical furnace, made of boiler iron, is proving very successful in desulphurizing and chloridizing the difficult ores of the district. Gulch mining will soon start up. The late excitement at Silver creek has about subsided. A number of mills are running here successfully and others are being fitted up and will start soon.

CLEAR CREEK.—Work on a large number of mines is being actively prosecuted in this district. Many of the ledges here contain a streak of ore from six to 15 inches wide, that carries high-grade ore, much of it yielding from \$100 to \$400 per ton, the most of it being milling ore. From five to 20 men are employed in each mine, the workings ranging, as a general thing, from 50 to 300 feet in depth. A very prosperous season is expected here, as the ore bodies have a permanent look and the rich ores carry developments forward without the aid of outside capital.

Montana.

MOOSE CREEK.—*Madisonian*, March 30: We shall all be disappointed if there is not more money taken out of the Moose creek mines this summer than has ever been before in one season. This lease on the Harvey & Day lode has expired. The parties who have been working it have a fine pile of ore on the dump. It is rich and will mill way up in the hundreds to the ton. The Only Chance lode, at Highland, is looking better than ever before. The "Official" is working his men on the Placer Patent as usual, with good prospects. The snow is two feet deep on the level, and the "Old Tar" says it measured 14 feet in a prospect hole a few nights ago.

PONY.—This camp has gradually dwindled to an almost insignificant number and illy compares with the crowded streets of one year ago, but those left can well be counted the bone and sinew of a once would-be big burg. Butte is now seldom spoken of and those who are left are contented with the general outlook of things and are ready to go "dead broke" on the prospects of Pony yet making one of the best towns in Montana.

Utah.

FRISCO DISTRICT.—*Salt Lake Tribune*, April 6: The Frisco reduction works start up again in a few days, with plenty of water. Both smelting companies are running finely and making 22 tons of high-grade bullion per day. This bullion will grade from 180 to 270 ounces of silver per ton, with a million tons of rich ore in the Horn Silver mine yet to be taken out. Two more leaching companies are about to commence operations. The Albion reduction works send their first silver brick to-day.

PARK CITY.—The Ontario company are grading for their new hoisting works. As far as explored in the 500 and 600 levels, the Ontario vein shows a width of about five feet of high-grade ore, which seems to grow somewhat hazy as depth is attained, but it unquestionably increases rapidly in value. It has been averaging heretofore about \$105 per ton, and in the lower levels will work about \$120 per ton of 2,000 pounds. The mill keeps steadily on rolling out its \$6,000 a day in bars, about 720 fine.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

ANTI-FRICTION BEARINGS FOR JOURNALS AND AXLES.—Thomas H. King, S. F.

News in Brief.

THEY want a mint at Denver.
THERE are 26 active gold mines in Georgia.
TEN Texas stock-raisers own 1,023,000 head of cattle.

RAILROAD building is being vigorously pushed in Oregon.

THE hay harvest has commenced in Los Angeles county.

THE railroad between Benicia and Suisun is completed.

THE famine in the northern provinces of China is increasing.

FRANKLIN, Ind., has an eight-year-old murder case on the docket.

GOLD is now received by Central City banks, Colorado, at par.

FIVE HUNDRED Chinese arrived in San Francisco on this last steamer.

TEXAS has 57,502,240 acres of public land subject to location.

THE worthless poplar forests of Maine are being converted into paper.

THE police force in San Francisco is to be increased from 150 to 400 men.

SPRING CREEK, near Lodi, Wis., has been stocked with 30,000 California salmon.

KANSAS has set her mark at 20,000,000 bushels of wheat as the State product for 1878.

THERE are evidences for some improved demand for skilled labor in the Atlantic States.

EDWARD MIDDLETOWN ALMONTE, first clown of Barnum's circus is dead, of quick consumption.

THERE are still 400,000 sheep in Los Angeles county as the remnant of last year's drouth and disaster.

TWO-THIRDS of the iron furnaces in Pennsylvania are in full blast. A year ago two-thirds were idle.

A KANSAS paper estimates that at least 4,000 people per day are arriving in that State to settle.

THE prices of lodging and entertainment of all kinds will be greatly advanced in Paris during the Exposition.

FIVE HUNDRED bricklayers struck in New York last week, to enforce the Union rate of wages—\$2.50 per day.

WM. M. TWEED, boss of the Tammany ring, died in the New York Ludlow street jail, on the 11th inst., aged 55 years.

ALLEN CROFT, the most desperate of Kentucky "moonshiners," has been captured. He has defied the Marshals for years.

A NUMBER of members of a colony from Germany to Venezuela have arrived at New York in a pitiable condition, the venture having proved disastrous.

At the Central Pacific railroad shops at Sacramento, work has commenced upon 300 flat cars for general use and 12 passenger cars for the Oakland trade.

THE Diaz government has been recognized by our Minister to Mexico, re-establishing full official relations between the United States and that country.

THE Supreme Court of Nebraska has decided that dealing in grain options in Chicago is gambling, and all contracts made in that State are invalid in law.

EX-GOVERNOR PACHECO, while out in a boat the other day, near Angel island, captured with the lasso a large deer swimming for the island, just as it gained the land.

THE hounty installment of \$100 per month to J. W. Marshall, the discoverer of gold in California, has been discontinued, the Legislature refusing a further appropriation.

THE Ladies' National League meeting, which organized in New York, the other day, to operate in behalf of the Indians, consisted of six women, four men and three reporters.

THE cotton masters of Lancashire have agreed to support each other in the event of isolated strikes against a 10% reduction of wages, until trade is stopped or the strike terminated.

TREASURY officials say Secretary Sherman's contract for the disposal of \$50,000,000 4% Government bonds will settle the question of the resumption of specie payments, on the first of January next, as provided by law.

DURING the severe storms that occurred in the State of Colorado in March, 25,000 sheep, 15% of the entire number in the country perished, besides several thousand head of neat cattle.

THIS year's crop throughout the great wheat-growing regions of the northwest, will average one-half more than last year, the prospect for the wheat crop being better now than for the past 17 years.

THE *Daily News*, a one-cent paper, has been started in this city.

THE Carson Mint began the coinage of the new silver dollar on the 15th.

THE Lowell (Mass.) mill owners have given notice of a reduction in wages from 5% to 15%.

ALREADY the heirs of Brigham Young and the Mormon church are in the courts, fighting for his estate.

A LITTLE son of Clarence C. Hickok, was drowned last week at Grand island, Colusa county.

THERE is danger now of a general rising of the native tribes against the British government in South Africa.

JUDGES HOFFMAN and SAWYER have decided that the cubic-air ordinance is perfectly constitutional.

To date 15 Molly Maguires have been executed in Pennsylvania, the murders for which they were hanged being six.

On last Thursday, Charles Nash was bitten by a rattlesnake at San Jose, and came near losing his life in consequence.

THE sum of \$32,000 cash was last week paid for 2,000 acres in Colusa county next the foothills and five miles south of Stoney creek.

JOSEPH CALLAGHAN was run over by a street car in this city on the 16th inst., and mangled so badly that he died in a few minutes after.

A GIRL named Brush committed suicide in Round Valley, Mendocino county, by taking poison. No cause is known for the rash act.

OWING to the inundation of the strawberry lands last winter in the Santa Clara valley, not more than half a crop is expected this season.

CAPT. PIERCE and four men were drowned, on the 11th inst., while attempting to cross the bar in two small boats, at Newport, Los Angeles county.

THE transit of Mercury, which is to occur the 6th of May, will be visible all over the United States, and seven hours and a half will be consumed in the passage.

THE Commissioners passed through Healdsburg a few days ago, on their way to stock the streams far above. They are soon to stock Russian river with Eastern catfish.

THE times for the surrender of the Cuban insurgents having expired, active operations will commence in the Eastern Department against Maceo and a few more chiefs who are still under arms.

THE Northwestern National Bank of Chicago has advertised that it will redeem in gold all of its circulating notes that may be presented. It is the first of the National banks to take this step.

THE war in South Africa is likely to become serious. There has been continuous fighting in the Pirie Bush for a week. Four British officers were killed. The situation in Transvaal is very serious.

In an altercation in a St. Louis saloon on Sunday last Timothy Ryan struck his opponent, Hugh Gormley, a tremendous blow on the neck under the ear with his fist, killing him almost instantly.

A CHINAMAN made his appearance in Leadville, Colorado, a few days ago, but left at short notice upon being interviewed by a committee of miners. This is the third time John has failed to get a foothold in that section.

JEANNETTE LAMERCHT, aged 67 years, rendered temporarily insane from the death of her husband, threw herself under the locomotive on the Oakland Point railroad and was completely headed.

CORTLAND WOOD, aged 65 years, at one time a member of the firm of Wood & Congdon, engaged in extensive mining operations at Murphy's, Calaveras county, killed himself in this city on the morning of the 13th inst., by a pistol shot through the head. Supposed cause, poverty through failures in business.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

GLOBE CITY CON. M. Co.—April 4th. Location, Arizona. Capital stock, \$10,000,000. Directors—R. D. Hopkins, A. W. Robinson, T. S. Atherstone, S. A. Buckingham and B. S. Kellogg.

AJO COPPER M. Co.—April 5th. Location, Arizona. Capital stock, \$10,000,000. Directors—Thomas Wallace, J. White, W. M. Rockwell, Charles A. Morse and T. J. Owens.

GROVE M. Co.—April 5th. Capital stock, \$10,000,000. Directors—Charles Clayton, Silas Selleck, R. M. Gibson, W. H. Douglass and S. M. Brunner.

JUPITER DEEP BLUE H. G. M. Co.—April 7th. Location, California. Capital stock, \$5,000,000. Directors—Frank Cummings, W. A. Keffer, R. A. Lloyd, J. D. Whitney and George C. Randall.

THE GLOBE CITY CON. M. & M. Co.—April 15th. Location: Arizona. Capital stock, \$10,000,000. Directors—R. D. Hopkins, G. W. Beaver, C. L. Weller, A. Hemms and Col. S. A. Buckingham.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, April 10th, \$2,057.12; Christy, 13th, \$4,506; Hussey, 14th, \$3,400; California, 13th, \$302,777.11; Con. Virginia, 6th, \$248,572.41; Raymond & Ely, 8th, \$966.73; Manhattan, 12th, \$16,864.59; Alexander, 15th, \$6,763.47; Grand Prize, 15th, \$20,600; Day, 8th, \$3,445.34; Manhattan, 15th, \$14,813.50; Northern Belle, 13th, \$3,256.94; Manhattan, 15th, \$14,812.56.

For the Paris Exposition.

The Committee on Minerals for the Paris Exposition announce that everything not in by the first of April will be left behind. It is likely that many mineral specimens intended for the great show will not reach here by that time, and as there are probably other things yet to be sent forward, it may be worth while to state that the American European Express, Baldwin Bros. & Co., Proprietors, 72 Broadway, New York, forward packages to the Paris Exposition at the following special rates: Four lbs. \$1.25; 8 lbs. \$1.50; 12 lbs. \$2.25; 20 lbs. \$3.25; 50 lbs. \$4.25; 75 lbs. \$5; 100 lbs. \$5.50, and for everything over three feet, 95 cents per foot. Custom expenses at Havre, 60 cents additional, per package. Freight in all cases to be prepaid.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

MR. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the Mining and Scientific Press Patent Agency Office. Business of importance.

ANY PHOTOGRAPHER having a large Camera Box for sale will please notify "N. S.," at this office.

MODEL MAKER and MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco, (fourth floor).

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this act at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Calaract and Wide West Hydraulic Gravel
Mining Company. Location of principal place of business, San Francisco, Cal. Location of works, Ebo Mining District, Calaveras County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment No. 1, levied on the fifth day of March, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

STEAM ENGINES AND BOILERS.

One new Straw-burning Portable Engine, made by Ransome, Sims & Head, Ipswich, England. This is a very superior engine, sent here as a sample engine for exhibition; one second-hand Straw-burning Engine, 8x10 inch cylinder, (Rico); one second-hand Wood-burning Engine, 8x12 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 7x10 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 6x12 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 6x12 inch cylinder, side engine; one new Stationary Engine, independent cut-off, 12x24 inch cylinder. (The Straw-burning Engines named are free from infringements.)

One large sized Rock Breaker, Varney & Rix, size 9x15; one Wood Splitting Machine; one 36-inch cylinder Russel Separator, (with extra cylinder,) and Lauffenberg shoe—very cheap, on account of owner's death; (will be sold with or without any of above engines.) All of the above second-hand engines have been in shop and overhauled, and are in good working order. Various other machinery for sale. Purchase made on Commission. Machinery repairs solicited. Specialty of Portable Engines and Boilers for threshing.

J. W. RILEY, (Box 2361) San Francisco.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day.....3 00
Wood, 1½ cords at \$3.....7 00

Cost of 20 tons.....\$13 50
Cost of one ton.....07½

From 2½ to 5 per cent. of salt is necessary.

To a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address: JUDGE WM. WEBSTER, Paymaster Mine, Reno, Nev. LEWIS CHALMERS, Manager Eschbacher and IXL Mines, Silver Mountain, Cal. J. S. COVEY, Vice-President Tehama County Bank, Red Bluff, Cal. R. H. CAMPBELL, Superintendent Afterthought Mine, Redding, Shasta County, Cal.

For further information, apply to

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted. Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing. The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby, facilitating their introduction, sale and popularity.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo. of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachap Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabazas, in the valley of Santa Cruz; Coronacion Peak, the Ariave Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA, Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

Publisher of the MINING AND SCIENTIFIC PRESS, S. F.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

R. HOE & CO.'S

CHISEL TOOTH MILL EDGER,

And Shop Circular Saws with

Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Filers are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging and stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

Number 17.

Hoe's Chisel-Tooth Saws:

We illustrate herewith the Hoe patent chisel tooth for circular saws, which has attained great success in the East, and has recently been introduced on this coast. The engraving represents the principle of the chisel-tooth mill and edger saw. The part marked *A* is a part of a rim of a circular saw-plate, in which is a No. 4 tooth, such as are put in mill saws, and a No. 2 tooth, such as are placed in edgers and shop saws. *B* are the chisel-hits or teeth and *C* the shanks, which hold the bits in place. The holes in the shanks are for a wrench, with which the shanks and bits are turned out of or into the plate when the bits get dull and it is necessary to put in new ones.

The shanks and hits have a groove in the back, into which the saw-plate fits, forming a dove-tail joint. The circle in the saw-plate is a true circle, the shank being eccentric, so that when the shank is turned into its place, carrying the hit with it, the bit is held securely against the plate. The shoulder of the bit coming against the plate, prevents it being turned around too far. When the teeth become dull a new set can be inserted in five minutes. The saw is then in perfect order. They are always exactly the same size and always perfectly round.

The round socket, the only one in which a tooth is firmly fixed in a saw-plate without rivets or keys, has received its finishing accompaniment in the rotary locking shank, by which the cutting hit is seized, carried into the socket and held in a positive position. This device is strong and simple in construction, reliable and expeditious, and, at each insertion of a new set of hits, the saw is in much better condition than it is possible for an expert sawyer to put a saw in, by dressing it in any of the ordinary ways.

The saws are now running with unequalled success in all the principal lumber districts throughout the continent, and in many cases subjected to rough treatment that would utterly destroy saws of other construction.

The chisel hits are forged into perfect shape from hot steel rods at one blow, thus, during the process, leaving the metal, which is of superior quality, in a state of rest without fracture, so that the hits cut knots without breaking and go through iron or stone at one-twentieth the cost and damage occasioned to a solid tooth saw.

The correct mechanical construction of this is manifest in the great strength and durability of its parts. The cutting hits, being short, are stiff, and the matching of the circular back with the plate prevents any lateral or rocking movement. They are tempered a little harder than a solid saw, will run longer before getting dull and may be ground or filed eight or ten times. Each hit will cut from 1,000 to 3,000 feet of lumber, depending upon the quality of the logs and the feed carried. When the teeth become dull they can be touched up with an emery wheel and reused. At the trial at the Cincinnati Exposition, in 1874, the chisel-hit saw was the only one of the 15 saws on trial that cut a whole log into all perfect boards.

Since the saw was introduced on this coast

the edge of the saw between the teeth has been cut away to some extent, and the shanks altered to correspond, and thickened in order to give more chip room and keep the chips from passing by the teeth and heating the rim. This was necessary, as the logs out here are so large in comparison with the logs usually cut in the East. Since this was done the saw has given great satisfaction. The sawyer at the Albion mill, Albion river, says he would rather pay for these shanks himself than to run the old ones. They shed the dust better, not allowing it to pass by the teeth and heat the saw. The Mendocino Lumber Company, in ordering

IMPROVED HORSE POWER FOR HOISTING PURPOSES.

some of these saws, say they give great satisfaction. Mr. Wallace, of Meigs' Port Madison mill, says: "If all the saws in the mill were of this kind and in proportion to the work they do, one engine would drive the mill as well as hoth do now." The sawyer at Hobbs, Pomeroy & Co.'s mill, at Crescent City, says he ran

hoisting engine on a small mine, viz.: power to hoist, a brake to hold the load at any point, or to lower at any speed, and means to stop the motion instantly at any desired point.

The power is mainly built of wrought iron, and is of simple construction. An ordinary timber bed-frame is laid, on which is hoisted a

are also agents for the Albany Lubricating compound and cups, Katzenstein's metallic packing, etc. The lubricating compound and cylinder oil are highly recommended. This firm is agent for mill and mine supplies of various kinds, and have also an agency at Virginia, Nev. (P. O. box 616.) The Albany compound and cups are extensively used in the mining machinery at Virginia and elsewhere.

Miners' and Builders' Horse Power.

The accompanying illustration will give the practical miner or builder a good idea of a power recently introduced by Mr. J. B. Reynolds, agent of the Ingersoll Rock drill and other standard mining machinery. Miners engaged in prospecting and developing new properties, have long felt the need of some good cheap power that would virtually do the work of an engine, while the cost of machinery and operating the same are merely nominal. This horse power combines in the simplest possible manner, all the points necessary for a good

not. When the collar is down the radial arms are drawn in so that their outer ends do not project through the sides of the cylinder, but when the collar is drawn up these arms project through the cylinder, so that lugs on the windlass arm engage with two opposite arms and the cylinder is revolved. The collar slides on the standard and lengthens or shortens the arms just as the hand of an umbrella does which carries the pieces forming the framework.

Now when the horse moves around in the circle if the arms are drawn on he simply moves the windlass bar without revolving the drum; but when the ends of the arms are projected through the sides of the drum, the lugs on the windlass arm engage with the nearest of the points and revolve the drum, thus winding up the rope.

It will be seen that the simple construction is a very great improvement over the ordinary whims. The horse can keep on walking around while the reel is revolving in an opposite direction in lowering a load or empty tub. When the man at the mouth of the shaft wants to hoist he simply throws over his lever and engages the arms with the lugs on the windlass bar when the horse takes the load. If it is necessary to stop the load at any time, by throwing the lever the other way the horse keeps on but the drum stops. An ordinary strap brake is applied to the drum and a foot lever is placed beside the other lever at the shaft mouth to control the brake. The horse power may be placed at any convenient distance from the shaft and the lever rods extended from it.

By this means the power is completely under the control of the man, and the danger of overwinding is avoided. The horse can be disconnected from the drum at any time and rest, or he may keep on walking as the case may be.

The entire working parts of this power are of iron and made in a good, workmanlike manner, with a view to economize in weight and at the same time to furnish a machine of all necessary strength.

The drum will wind 500 feet of wire rope capable of a working strain of 1,500 pounds, without lapping or covering to exceed 14 inches of drum surface. A patent for this

process has been applied for through the MINING AND SCIENTIFIC PRESS Patent Agency, and they have already commenced to be introduced in the mining districts of California and Nevada. They are manufactured and can be seen at the office of J. B. Reynolds, 307 Market street, in this city. For hoisting purposes this class of power is excellent, as it is under complete control without the operator having to be close beside the horse. For mining purposes or prospecting mines it appears to us a very useful and efficient contrivance.

CHEAP TRAVELING.—Paris Exposition Commissioner Quimby has made arrangements with the Pacific Steamship Company, and through them with the Royal Mail Steamship Company, that emigrants can be hooked from Southampton to San Francisco for \$100.

SECRETARY SCHURZ attributes his recent illness to the large quantities of green tea which he has been drinking to produce wakefulness for night work.

THE HOE PATENT CHISEL TOOTH FOR CIRCULAR SAWS

the first set of teeth, "over 18 hours, some of the time on three-inch feed." The saw cuts very nice lumber, goes through the knots in a wonderful manner, and does not take as much power as the old saws. The saw is in use also at Dixon & Co.'s mill, Coffee's Cove, Hansen, Ackerson & Co.'s Tacoma, W. T., mill, Nelson Bro.'s mill, Plum valley, Sierra county, and at many other places on this coast. We have been shown numerous testimonials from sawyers and other practical mill men who unite in recommending the Hoe saw.

The agents for this coast are Messrs H. L. Tatum & Co., 51 Fremont street, S. F. They

metal bed-piece, carrying a hollow standard which projects up inside the cylinder or drum, and on top of which is placed the windlass arm, to which the horse is attached. A sliding collar is placed on this standard inside the drum, and on this collar are pivoted a number of radial arms which extend out to holes in the side of the cylinder or winding drum. Inside of the standard is a clutch capable of being moved up or down by means of a crank-rod and lever-bar. This clutch is so engaged with the collar carrying the arms that by moving the lever bar the clutch draws the collar up or down on the standard, whether the drum is in motion or

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Bodie Mines.—No. 1.

[By the MINING AND SCIENTIFIC PRESS Correspondent.]

An Outline of the Early History Thereof, with Something of Present Affairs.

When the placer mines on the western slope of the Sierras began to lose caste, the early emigration commenced to rebound eastward, and during the latter portion of the "50's," paying diggings were discovered at various points opposite the old stamping places of '49. Along this line of successful exploration, the Mono county mines were discovered, out of which grew an interest in quartz, resulting in the organization of Bodie district, now a chief center of attraction for mining men. As nearly as can be arrived at, the first locations were for placer diggings, and were made in September, 1859, by a man named Bodie. The first locations along the line of the Comstock were already a matter of more or less public interest, and, owing to the scarcity of water in Bodie, the quartz indications soon overshadowed the importance of the rich gravel deposits. The original discoverer, however, met with a melancholy death before realizing any benefit from either. While returning from Mono, where he had been to obtain provisions, in March, '60, he was lost and perished in one of the snow storms, to which the high and exposed altitude is subject. The work of developing the district was slow, and but for the more exciting times incident to the adjoining district of Esmeralda, it is probable that Bodie might have remained dormant indefinitely. The latter district was not discovered until a year later, but it acquired a notoriety, to say the least, that served to lend interest to everything round about, and contemporaneous with said excitement, Bodie secured the organization of several companies, with capital sufficient to open up several claims, and built a couple of mills. This occurred during '63-4, and in sympathy, so to speak, with the decline of affairs in Esmeralda, Bodie developments came to a practical standstill and so remained for a period of about 14 years. It would require a full page of the PRESS to do anything like justice to the few men who held on to the ragged edge of Bodie bluff during all those years and maintained their faith by their works, an insignificant number of whom have at last realized something of their early hopes. "To the grave with the dead and the living to the bread," and, according to the Panza philosophy, we will enter upon the new dispensation.

After a succession of failures and changes of ownership, at least one of the old claims on Bodie bluff fell into fortunate and judicious hands. This event took place in September, '76, and within one year, to a day, a dividend of \$1 per share was declared, in addition to the construction of a 20-stamp mill, erection of steam hoisting works and a tramway between mill and mine, a large quantity of supplies provided in advance, and all out of the proceeds of the mine. The first ore crushings by the Standard company was had in the mill of the Syndicate company, a property purchased for taxes in '75, and having been handed down from '65 by the Empire company, of New York. The Standard mine—originally the old Bunker Hill—was purchased by Seth and Dan Cook, upon the recommendation of John F. Boyd. No more interesting property altogether in the way of mining exists anywhere on the coast. It is a gold mine, which is explored to a depth of over 800 feet and a length of equal extent, and everywhere maintaining a uniformity of size and richness and perfect formation that give the best assurance of permanency, according to every practical and scientific test. The ore is cheaply mined and milled, the dividends are a regular monthly occurrence, but the stock of the company is not a feature of the market.

Out of the gratifying success of the Standard, has grown all the excitement about Bodie, including the organization of half a dozen strong companies and the rapid development of the district. The Bechtel, next to the Standard, is most spoken of, having made comparatively extensive explorations. The vein is not so large, as a rule, as the Standard, and varies in uniformity, recently exerting a depressing influence upon the stock, but of late the formation is quite favorable again, and all in all the Bechtel will be rated as a leading property in Bodie. Next to the Standard, however, the Syndicate company are carrying out a programme which will do most towards determining the more distant future of the district. The Standard company, in addition to their immediate operations as to the mine, are sinking a great central shaft, which might of itself put the Bodie Bluff mines to a pretty thorough test within a year or so, while the Syndicate people are pushing a tunnel into the north end at a low level, running parallel with the veins which incline to a common center, for the purpose of crosscutting each way. At another time I will explain this feature of the district by means of a diagram. Of the other operations on the Bluff proper, the Bodie, Bulwer, Belvidere, McClintock and Blackhawk are the most conspicuous. The usual depths attained as a rule being about 250 feet, with drifts and crosscuts, and all showing veins of more or

less importance, but none of the companies making a business as yet of extracting ore beyond that necessary in exploration. At present there is no milling facilities in the district equal to the demands of the Standard alone, and no new mill out-and-out is proposed to be erected in advance of thorough prospecting. An old four-stamp mill is rapidly approaching completion, and the important repairs on the Syndicate (the old Empire creation of 1864 and '65) will be effected early in May, so that custom work will not be altogether slighted.

The district shows considerable activity over a scope of country one by three miles in extent. The southern end is especially increasing in interest, owing to the discovery last December of an extensive and rich deposit of vein matter called the Richter, after the name of the fortunate gold-hunter. (Its incorporated title, as printed, is "Richer," an auspicious play upon the word.) Should this assume the permanent form it gives promise of, Bodie Bluff will have to look to its laurels. A company of practical men will proceed at once to its development, and it will not be surprising if they build a mill of their own ere the end of the present year. About midway north and south, and on the eastern side of the district, the Red Cloud company are doing fine work in the way of exploration, and with a most auspicious outlook, looking to the necessity of still another mill at an early day. They have steam hoisting works and have attained a depth of 250 feet, with considerable drifting and crosscutting. Works of lesser magnitude but showing well, are the Pacific, the Black Hawk, Spaulding, Goodshaw, the Booker and others.

Under the new dispensation, Bodie has made rapid progress, but there is much to do yet, and much more worthy to be said. It will bear inspection now, and will constitute an interesting theme for discussion for an indefinite period. J. W.

Mining in Yuba and Placer Counties.

[From Our Own Correspondent.]

My last closed with some account of copper operations at Spenceville, in Nevada county. Crossing into Yuba, five miles south of Smartsville,

The Lone Tree G. & S. M. Co.,

Under the superintendence of Mr. S. P. Hussey, were found busily at work on a quartz ledge favorably situated on an elevated spot of ground in the foothills, overlooking the Sacramento valley. The company first broke ground about a year ago, since which a shaft has been sunk 150 feet, a drift run north from bottom of same 40 feet and another south some 60 feet, showing an average width of vein of four feet. A mill test of rock at Grass Valley gave \$14 per ton. The prospect of the mine is considered good and daily growing better. At Lincoln, in Placer county,

Some Matters—Mining and Mechanical.—Are met with of sufficient importance to require more than a passing mention. The village is situated on the line of the California and Oregon railroad, 10 miles from its junction with the Central Pacific. It has more than the usual complement of blacksmith shops—one of the best being that of Mr. John Haenny, with a good wagon and carriage making department in connection; but the most important enterprise in the place is the extensive manufacturing establishment of the

California Vitrified Sewer Pipe Works, Messrs. Gladding, McBean & Co., proprietors, with office at 213 Market street, in your city, the name fully indicating its object. The pipe is manufactured from a combination of the somewhat celebrated stoneware clays of the vicinity. The material is rendered homogeneous throughout by means of very powerful machinery, and as a steam press is employed, bringing to bear a great pressure, the pipe is made very compact—in fact, at a high temperature, becoming thoroughly vitrified and entirely impervious to the acids, gases and steam from city sewers, thus rendering it of almost priceless value as a sanitary agent. Calculating the ordinary amount of rainfall on three acres to be 1.131 gallons per minute, a 12-inch pipe with nine inches fall per 100 feet will be ample for the purpose, with a large margin for contingencies.

A Coal Mine,

The Cook & Spinks, is located within sight of Lincoln, and covers 100 acres of ground. It is opened by shaft 4 hy 6 feet to the depth of 70 feet. The main drift from the bottom of the shaft has been run 260 feet, following the coal bed, which lies in a horizontal position. Two cross-drifts, each 130 feet, have also been made, passing the entire distance through coal. The developments show the ledge to be 7½ feet in thickness, with two clay seams interlying, the upper from 4 to 6 inches thick and 3½ feet from the top of the coal, and the lower about 8 inches thick and one foot from the bottom. The formation overlying the coal is composed of two strata of clay, with a streak from 2 to 4 feet thick (interposed) of a pure white sand, crystallized, and believed to be of a quality well adapted for manufacturing white glass, the stratum nearest the surface being a fire-clay and the one immediately over the coal plastic clay. The coal is a very good quality of the lignite class, represented as the best of that kind heretofore found in the State, and as wood

is fast growing scarcer, the demand for it will soon be greater than now.

A Quartz Ledge.

Five miles north of Lincoln, a mine known as the "31," owned by Messrs. Crosby & Baker, has been opened by four shafts, the greatest depth reached being 80 feet. It lies between the slate and granite, with a beautiful clay gangue one foot thick on the foot and granite wall. The ledge is from four to six feet. One hundred tons crushed at the rate of \$10 per ton.

A Curiosity.

A piece of scrap iron completely coated with copper having been found by Mr. J. C. Crosby in the water flowing out of an old tunnel in this same neighborhood, he immediately made a relocation. It has been reopened about 50 feet in length, the bottom covered with lumber and the sides boarded up about six inches. This box, together with 7 tanks 12 feet by 18 inches wide on the outside of the tunnel, is filled with scrap iron, and the water from the old mine allowed to flow over the whole. Being strongly impregnated with sulphuric acid, the iron is eaten up and the copper precipitated. The contents first appear simply as a red mud, begin to harden in from four to six weeks, and in six months are taken out pure hard copper. By this cheap and effective arrangement about 200 pounds are made per day.

A Cheap Concentrator

Was also seen here, the invention of Mr. J. C. Crosby. Although it cannot well be described in the absence of an illustration, yet its chief points of advantage may be briefly stated:

1st. It is represented to save as many if not more sulphurets than the best in use.

2d. It saves two grades, a coarser and a finer.

3d. It is recommended for its cheapness; a pair, worked by the same machinery, costing but \$60.

4th. It is made of lumber and can be put up by the carpenter of the mill; and last, not being patented, is open to the public. A. C. K. April 14th, 1878.

Dr. Lewis' Camping Tour.

We have received from Dr. Dio Lewis the following spirited note about his camping tour, to which we have alluded before. We believe the trip will be productive of health and pleasure to all who undertake it:

EDITORS PRESS:—On the first of May we begin our camping trip through the mountains of this State. We shall be absent four and a half months, and travel between one and two thousand miles, almost exclusively in the mountains. Already more than 30 ladies and gentlemen have enrolled their names in our company. Members of the party will pay just enough to meet the actual expenses.

If about 15 persons, slaves of the alcoholic appetite, would join us for the summer I would engage to cure them of their unhappy malady. In such a life more can be done to cure this disease of the brain and nervous system in a month than can be done in a year in any of the institutions established for that purpose. Persons may join at any time up to July 1st, and can send for circular to W. S. Lyon, Oakland, Cal.

A MISTAKE.—We stated last week that the Legislature had appropriated \$50 per month to J. W. Marshall, the discoverer of gold, at Coloma. A bill to that effect passed the Senate, but, we are sorry to say, failed to pass the Assembly. The State has been supporting Mr. Marshall for several years, and to now, in his old age and feeble condition, in the time of his greatest need, to go back on him, is simply an outrage. It is evident that he must soon be subjected to the humiliation of becoming a county charge or depend upon private charity. If an appropriation to Marshall, by the State, was to be left to the people, he would get it by an overwhelming majority. It would be a credit to the millionaires of the coast, were they to contribute a moiety of their wealth to a fund to be devoted to the support of the man who opened the door to their fortunes during the brief period that remains to him.—*El Dorado Republican.*

THE CALIFORNIA QUICKSILVER MINE.—This property, says the Woodland Mail, is now in splendid condition, showing more first-class ore than ever before. The company have had built, during the past fall and winter, three new furnaces, two of which are for the reduction of fine ore, with capacities respectively of 15 and 20 tons per day. The third is for the reduction of mercurial soot, to be used in the place of iron retorts and with less than half the expense. The products of these mines go to market through Yolo county, and will be double what they have heretofore been. All supplies for consumption at the mines, for man and beast, are purchased in Yolo county, and certainly adds something to our business, when we consider the fact that there are between 75 and 100 men at work and a large number of horses and cattle.

ARIZONA BULLION.—It is estimated by mining experts who keep posted on the yield of bullion being produced monthly in Arizona, that the amount will aggregate \$300,000, which amount is liable to be doubled within the next six months. Arizona in two years from this time will lead Colorado in the production of precious metals.—*Prescott Miner.*

Death in the Depths.

Mining accidents are of so frequent occurrence on the Comstock that they have come to be considered as a matter of course; that is, if they are considered at all. The particulars are given with great exactness by the reporters, every minute detail and item attending the disaster being spread forth; and after all this is done, the paper is scarcely read before it is thrown aside, and little is afterward thought of the story of death which is told.

In order to understand the sorrow and misery occasioned by the death of one of these "stalwart toilers of the deep," one has but to witness the scene when the dead miner is brought to his own home. A *News* reporter was present upon such an occasion not long ago, and the impression made at that time will be as lasting as life.

An express wagon drove slowly up to the door of a roughly built house, which was but one story high and finished with a shed roof. A crowd of curious men and women were gathered around, and two children of the deceased, scarcely old enough to realize their great loss, sat cowering upon the rude steps. The dreadful story had been told the wife a few minutes before, and she sat upon the ground with her head upon her hands, weeping as if her heart would break. Before the first burst of grief had subsided the mangled body of her husband was before her. A blanket containing the shattered remains of what was once a strong, proud man was taken from the wagon and placed on the floor. An arm and a leg were missing, and the face was unrecognizable. Half the head was gone. The only way they knew it was Jack, was by the clothes he wore. He had lost his footing at the upper pump station, and when they found him he was cold in death.

When a man falls down a shaft, there is little else but shreds left of him, and he never knows what hurts him. The next day there was a grand funeral, attended by the members of the Miners' Union, but few could imagine the utter sorrow and despair of the scene in front of that miner's home the day before.

Death comes suddenly to the men who go into our mines, and when the cage descends with them they do not know that they will come out alive. Men, women and children in this community become accustomed to looking upon life as a matter of great uncertainty, and an accident which would startle many another neighborhood, is but casually commented upon here. It is not thought of so much importance as the stock market or the weather, and is lightly considered outside of the parties affected by it. Familiarity with scenes of danger and distress have rendered our people almost equal to the stoic philosophers of old, who held their pride above their pain, and cultivated a feeling of contempt for all manifestations of sympathy with human sufferings. This is the natural result.—*Gold Hill News.*

THE USE OF ORNAMENT IN CONSTRUCTION.—At a meeting of an English engineering society Mr. R. Blunt read a paper on "The Use of Ornament in Manufacture," under which title he spoke of two correlative subjects, viz., the place and use of ornamental beauty in structure and design, and the manufacture of ornamental work for such purpose. Taking the first question, he contended for the encouragement, wherever possible, of ornamental beauty in engineering structural work, contesting and criticising Mr. Ruskin's law (as laid down in several passages quoted from his works) that all ornament or decoration whatever is inadmissible in places of business and active life, and is to be confined to the beautifying of home. Passing to the second question as to the use of machine-made ornament, Mr. Blunt defended the employment of such work in default of hand-made sculpture against the charges of badness and dishonesty which Mr. Ruskin alleged against it. He then defined the proper place and purpose of good ornamental work in completing and aiding to harmonize the effect of the whole structure, and, while strongly condemning all badly designed, made and placed ornament, of which he gave illustrations, pleaded that it was largely in the power of engineers and architects to decide whether they would aid by their work in the encouragement of what was beautiful in shape and proportion or the contrary.

A SUPPLEMENTARY CONTRACT FOR THE POUGHKEEPSIE BRIDGE.—We have already announced, says the *Iron Age*, on the authority of the chief engineer of the Poughkeepsie Bridge Company, that work on that great structure is about to be resumed. A temporary stoppage of the work took place several months ago on account of differences arising between that company and the contractors, known as the American Bridge Company. It is satisfactory to know that within a few days these have been adjusted by a supplemental contract executed in this city, so that now all is harmonious, not only as between the respective companies, but a number of men who have been waiting for their pay will soon get their dues. The action just taken was made necessary in consequence of increased expense in carrying the foundations deeper than was originally contemplated.

WHAT EACH HAS DONE.—The United States stands first in telegraphy—79,000 miles; England second, 75,000. The telephone is American, as was the telegraph. We gave the world the steamboat, the telegraph and the telephone. England gave us the railroad.

MECHANICAL PROGRESS.

New Process of Steel Casting.

We read in the *American Manufacturer* an account of a new process of making irregular shaped steel castings such as plow-shares, out of fine tool steel, any desired percentage of carbon, without annealing, as in the ordinary "steel casting" processes. It is the invention of Mr. A. J. Nellis, of the Pittsburg agricultural works. In the ordinary method of making steel castings, it is necessary for the steel to be very high in carbon, in order to be fluid enough when melted to run into a fine casting, and the excess of carbon is removed after the casting is made by a process of annealing which requires from 10 to 20 days. By Mr. Nellis's method of making castings, low carbon steel, or ordinary tool steel, may be employed if desired. The mold in which the casting is formed is impregnated with combustible materials, which takes fire the instant that the melted steel comes in contact with the mold. An intense heat appears to be generated, which retains the steel in a perfect fluid condition till it reaches the smallest corners of the mold, and an agitation is caused by which all air and confined gases are allowed to escape from the metal, thereby making the casting free from blowholes. One theory of the action of this process is that the combustion of the materials with which the sand is impregnated consumes all the oxygen of the air within the mold, and the remaining gases have no "affinity" for the steel. The plow-shares made by this process can be forged into any shape required by an ordinary blacksmith, or after it is entirely worn out he may draw it down into tools and entlery. If the new process succeeds as well as it promises to do, we may soon see steel castings largely used instead of wrought iron or steel forgings for all difficult shapes. Mr. Nellis also has a patent on the mold used for his steel castings, which obviates the trouble experienced with iron molds, of the melted steel adhering to them on all sides, and causing shrinkage cracks, and has all the advantage which iron molds possess of durability and permanence of form. The molds are made chiefly of iron, but with inserted sections of sand. These sections do not adhere to the casting, and shrinkage can take place without hindrance, avoiding cracks or internal strains.

LATHE TOOLS AND TOOL POST SLOTS.—Robert Briggs writes for the *Polytechnic* some hints on lathe work which are of general interest. For the performance of a large quantity of work by the lathe, no greater necessity exists than for heavy turning tools. The numerous attempts of 30 and of 10 years since to use cutting points for turning have all ended in practical failure. No nicety of shape or fitness to meet the exact requirement for easy cutting of metals will recompense for want of material, both in continuity and in mass, to conduct away the heat of the cut and of friction on the cutting surfaces. The smallest working tool for turning iron should be $1\frac{1}{2} \times \frac{3}{4}$ steel in the shank, the slot of the tool post of the lathe, which swings 10° only over the ways, should take this dimension easily; $1\frac{1}{2} \times \frac{3}{4}$ steel is not excessive for tools for the 30 inch lathe, where profitable return for use of the lathe is expected. The posts themselves, with their gripping screws and bearing rings, can hardly be too heavy, while they can easily be too weak. For a 48 inch lathe it does no harm to have the slot in the post $2\frac{3}{4}$ or $3 \times 2\frac{1}{2}$, or $2\frac{1}{2}$, with a two inch screw. The refinement of spring tools for heavy cuts or for long cuts without a re-sharpening, are well enough for tool rests with V slides, or lathes where the ways have V's; but neither excellence of workmanship, nor speed of running, nor heavy cuts, will result from makeshifts of lathes, or of turning tools, however well the makeshifts may be contrived.

SEWING MACHINE MOTOR.—A Vienna mechanic has succeeded in constructing an apparatus for working sewing machines. Electricity, steam or water power are, on the score of cost, domestically inapplicable, so the inventor of the new machine was restricted to gravitation or elasticity, and he preferring the latter force, has contrived to make springs strong enough to keep an ordinary sized machine in motion, it is said for hours. A system of cog-wheels is arranged underneath the surface of the table upon which the machine is fixed, and by a handle at the side the spring is wound up with facility. The velocity at which the machine works is entirely at the option of the person using it, and can be easily regulated.

TYPOGRAPHICAL MACHINES IN NEW YORK.—We read that in one large printing office in New York city there are several type-setting machines in operation, on which the use of composing-sticks, and the trouble of banding them and adjusting the type, is avoided, the adjustment being done on the machine, which transmits the type directly on the galley, and rings a bell when the galley is full. The distributing machine, however, is the most difficult problem, and has been successfully solved here also. It requires no manual assistance, except to put into the machine the galleys with the pages on them. When the page is distributed a bell is rung and the machine stops until the next page is put on.

NEW SYSTEM OF PILE-DRIVING.—The *Journal of the Franklin Institute* says that the Messrs. Stoecklin & Vettillart, in their works for enlarging the harbor of Calais, found great difficulty in sinking the piles and planks through the fine, moist beach sand. The use of water to facilitate the penetration of broken iron piles suggested its use on the outside, and in advance of the wooden logs that they were using. By the use of two hand-pumps the sand was so loosened and held in suspension that the labor was greatly ebrided. On the old plan an average of 155 blows was required to drive a pile, 900 blows for a panel, requiring, on an average, 8 hours and 36 minutes. With the help of water injection the number of blows per panel varied from 0 to 50, the mean time being only 1 hour and 9 minutes; many of the panels required only from 14 to 16 minutes, and the longest time was only 1 hour and 45 minutes. The extraction of displaced or broken piles or planking, which has hitherto been attended with great difficulty, is accomplished with the greatest ease by the new system.

VELOCITY FOR CIRCULAR SAWS.—The *Manufacturer and Builder* says: That 9,000 feet per minute for the rim, on an average, may be laid down as a rule. For example, a saw 12 inches in diameter, 3 feet around the rim, 3,000 revolutions; 24 inches in diameter, or 6 feet around the rim, 1,500 revolutions; 3 feet in diameter, or 9 feet around the rim, 1,000 revolutions; 4 feet in diameter, or 12 feet around the rim, 750 revolutions; 5 feet in diameter, or 15 feet around the rim, 600 revolutions. The rim of the saw will run a little faster than this, because the circumference is a little longer than three times the diameter. Shingle and other saws, either riveted to a cast-iron collar, or very thick at the center and thin at the rim, may be run with safety at a greater speed.

AN IRON BUGGY.—An attempt has been made by an inventor, resident at Berlin, in the Maryborough district, Victoria, to introduce iron buggies into use. Mr. Alexander Jamieson has constructed a vehicle which consists exclusively of iron and steel. For instance, in place of hickory spokes and oak felloes, he has employed wrought-iron tubes and T iron. The tubes fit into the axle box at one end, and are riveted to the T iron at the other. The first noticeable effect of the employment of iron for all parts has been to add to the weight of the vehicle. This has accrued in spite of the thinness of the parts. The cost also has been enhanced. Strength and durability are regarded as a full equivalent for the increase of cost, and to belong to that form of expensiveness which proves cheapness in the long run. The vehicle, it is said, has a neat look, and an appearance (if not a reality) of lightness which renders it attractive.

BORING HARDENED STEEL.—In the "Journal suisse d'Horlogerie," 1877, p. 76, the following method is given: The drill is made oval pointed instead of having the usual form. It is hardened as much as possible without being burned. The surface of the steel to be drilled is next moistened with a little nitric acid, so as to make it a little rough. The drill is then applied and is from time to time moistened with oil of turpentine. Many workmen use instead kerosene or good rectified petroleum, in which previously a little camphor has been dissolved. When the drill acts no longer, clean the hole of chips with a little turpentine or kerosene and add nitric acid to roughen the smooth bottom of the whole, and proceed as before. This operation is, it is true, a little tedious, but it comes finally to the desired end and is the only safe way of boring hardened steel.

SIMPLE FORM OF BUNSEN BURNER.—*Dingler's Journal* says that this can be easily made of glass. A tube of glass, four or five inches long by one-third or one-half of an inch wide, is taken, and by blowing out the glass, beated at two points by the pointed flame, the air holes at the bottom are produced. The gas is introduced at the center of the bottom of the tube by an upward-bent glass quill tube, with the delivery end shaped like this cross x, a form well adapted to mix the rising current of gas with the air. This tube is fastened to the lamp by a foot, made of plaster of Paris, in which it is embedded. A short piece of glass tubing may be fastened by a rubber coupling to replace fractures. This lamp is much better for the flame reactions than the ordinary metal lamps.

MACHINERY RUNNING AT NIGHT.—The *Manufacturer and Builder* has timed the revolutions of wheels and found them actually the same night and day, notwithstanding all present in the shop imagined that they run faster at night. The simple reason is that by the stillness of the night, the motion of ponderous machinery appears more rapid and heavier, while in the day time it is partially drowned by other noises; this, acting on the imagination, causes the assumption of a greater velocity. Simply timing with a watch destroys the illusion.

THE LABOR ON A SHIP.—The following are the closing remarks of John Roach, when making a speech a few days since, after launching the iron ship *Rio de Janeiro*: Seven months ago the material for yonder vessel, which was launched a half hour ago, was lying in the bowels of the earth. There it was worth \$5,000. Today, in its present shape, it represents \$500,000, and that money has gone to the elevation of American labor.

SCIENTIFIC PROGRESS.

Atmospheric Ozone.

In a lecture by Prof. Leeds at the Stevens Institute of Technology at Hoboken upon "Ozone and the Atmosphere," the lecturer announced the results of a series of analysis of the atmosphere, and compared them with those executed by Regnault, Bunsen and other European chemists upon the composition of the air in other parts of the world. The samples of air had been collected on various occasions upon the grounds at the Centennial Exhibition at Philadelphia, and in the different Centennial buildings. During the same summer samples were collected in New York, Brooklyn, Hoboken, and upon many of the Adirondack mountains. Beside these samples, beginning with one taken on the 4th of July, 1876, others were being collected and carefully preserved, with the design of transmitting them to some chemist of the future who, by analyzing them with improved methods at the lapse of a century, might be better able to decide what is still a matter of assumption, that there are no causes in operation to produce a slow secular change in the constitution of the earth's atmosphere. The ordinary statement that the air has an invariable composition is not strictly true, because no two samples of air collected at different times and places are absolutely identical; and a decrease which appears numerically insignificant in the percentage of oxygen becomes of grave importance when the deficiency, as is usually the case, is made up of less beneficial ingredients. Attention was called to Schonbein's immortal discovery of ozone in the gas which is liberated on the decomposition of water by a galvanic current, was illustrated to the audience by projecting an image of this decomposition on the screen. The liberated ozone carried over into liquids, which showed its presence by striking changes in color and properties.

A new machine was exhibited for the production of ozone in large quantities and in a very concentrated form. The oxygen, after cooling to zero, was deprived of every remaining trace of moisture by powerful drying agents, and then finally passed through tubes highly electrified. The instantaneous bleaching of indigo, the oxidation of silver and other minerals demonstrated the intense chemical energies of ozone so formed. In conclusion, Prof. Leeds pointed out the necessity of systematic observations upon atmospheric ozone in all parts of this country, and the great value of such observations in relation to the growth and spread of disease.

THE COMING TRANSIT OF MERCURY.—A good deal of interest, says the *Independent*, is felt by astronomers in the transit of Mercury, which is to occur on the 6th of May and will be visible all through the United States. The observations of this phenomenon will have a considerable value, by themselves considered, as giving a very precise determination of the planet's place; thus furnishing a severe test of the accuracy of Leverrier's tables, and consequently of the reliability of his conclusions respecting an intra-mercurial planet or groups of planets. But the chief importance of the observations lies probably in their bearing upon the observations of the transit of Venus. The optical appearances must be nearly identical in the two cases; and, hence, a transit of Mercury affords excellent practice in the way of preparation for the more important event. By the liberality of a French banker, who appropriated 30,000 francs for the purpose, Messrs. Andre and Angot, French astronomers of distinction, have been sent to this country, to make the necessary observations, and will take their station at Ogden, on the Pacific railroad.

PULSES BY TELEGRAPH.—*Appropos* to a lecture in England on the telegraphing of pulse beats the editor of the *Manufacturer and Builder* remarks: This reminds us of the pleasure we enjoyed when at the meeting of the American Association for the Advancement of Science, at Salem, Mass., in 1874, the different beats of the pulses of various patients in the Boston City Hospital were made audible by telegraph in Salem to a large audience. The difference of the pulses in patients laboring under attacks of pneumonia, phthisis, fever and ague, etc., was quite marked, and perfectly satisfactory to give data by which to recognize the disease. Making the vibrations also visible is a step in advance.

RELATIVE SENSITIVENESS OF VARIOUS TESTS FOR ARSENIC.—The Marsh apparatus detects 0.0003 m. g. of As_2O_3 dissolved in 150,000,000 times its weight of water. The method of Von Baho and Fresenius detects 0.002 m. g. of As_2O_3 That of Reinsch by copper, 0.001 m. g. of As_2O_3 in 5,000,000 times as much liquid, and Rieck's method by ammonio-nitrate of silver detects 0.002 m. g. in 3,000,000 parts of water.

DELICATE TEST FOR VAPORS OF MERCURY.—*Comptes Rendus* says that paper impregnated with mixed chlorides of platinum and palladium give a brown coloration when exposed to vapor of mercury. It is found by this test that mercury volatilizes even when frozen. Salts of gold and silver are sensitive also, but not to the same extent. The scientific and industrial applications are evident.

Cheese and the Microscope.

At the last meeting of the San Francisco Microscopical Society, Mr. E. J. Wickson, editor of the *Pacific Rural Press*, asked the attention of the members to a slide containing sections of ordinary full cream cheese and cheese made by introducing oleomargarine into skimmed milk. He described the process of making oleomargarine cheese, namely, by removing the cream from the milk, and then stirring in liquid oleomargarine to supply the fat removed in the cream. The mass is agitated and rennet enough added to form a curd quickly before the oil can separate from the skim milk. The aim of the process is to form an emulsion of oil and a menstruum of soluble casein, like that which exists in natural milk. This process has succeeded so well that chemical analysis has shown the artificial cheese richer than the genuine, and so great an improvement on skimmed cheese that large quantities are sold in New York and shipped to Europe. Mr. Wickson stated that he had studied this artificial cheese with the microscope, and found that the emulsion made by the cheese-maker was not nearly so perfect as that made by nature in the cow, and therefore it was easy for a microscopist to distinguish between the two products. In the slide which was shown the two sections of cheese were in juxtaposition. The cheese made from full cream milk was seen to be of close texture, and the natural fat was incorporated in the substance. The oleomargarine cheese showed cavities of irregular shape in which the artificially introduced fat was imprisoned when the curd formed. The difference simply consists in the results of an imperfect emulsion in which the fat exists in masses rather than in globules, as in milk. Mr. Wickson remarked the difference between the cavities usually formed by gas in full milk cheese and those which held the oil in oleomargarine cheese. He stated that he first pointed out the characteristics of the two makes of cheese, and regarded the microscope as an infallible detective of the true qualities of cheese.

ENTOMOLOGY AT PARIS.—The Societe Centrale d'Agriculture et d'Insectologie has erected in the Champ de Mars an appropriate building, in which an extensive and exhaustive exhibition of all that relates to the breeding of useful and the destruction of injurious insects will be held during the present year. This building in which will be reproduced on a much larger scale the collection actually existing in the Luxembourg gardens, is to be, after the International exhibition, transferred to the Place de Montsouris, in the center of an area of 2,000 superficial meters, which will be exclusively devoted to exhibitions, and public lectures on agriculture and insectology. Dr. Marmottan, President of the Societe Centrale, and M. Hamet, the general secretary, have to that end, opened negotiations with the Paris Municipal council, who, however, hesitate to grant the use of the site in question, in case the neighborhood of the bees would inconvenience passers-by. This, however, is likely to be obviated, the scheme has all prospects of being successfully carried out.

COMBINATION OF NICKEL WITH CARBON AND SILICON.—E. Gard (*American Journal of Science*, Vol. 14, p. 294) has analyzed three buttons of nickel, which were produced by melting commercial nickel with carbon. They gave the following results:

Nickel.....	98.203	98.392	97.440
Carbon.....	0.530	1.104	1.990
Silicon.....	0.303	0.130	0.255
Iron.....	0.464	0.108	0.301
Cobalt.....	0.446	trace	trace
Sulphur.....	0.040	0.266	0.104

He further mixed pure oxide of nickel with powdered quartz and wood charcoal and heated to melting. The resulting white metal contained 9.3% carbon, 6.6% silicon. Commercial nickel melted in a Hessian crucible with charcoal gave 2.12% carbon.

NEW COOLING AGENT.—According to *Les Mondes*, Ch. Tellier has used trimethylamine for the production of cold, under conditions which lead him to regard it as the best known frigorific. Vaporizing at $+8^\circ C$, under ordinary pressures, it requires a pressure of from one to two additional atmospheres to relify it. This property allows us to utilize waste heat, especially the waste steam of manufacturers, so that the cost of the refrigeration is limited to the bare expense of superintendence. A degree of cold equivalent to that produced by the consumption of 10,000 kilogramme of ice, can thus be obtained for a few francs.

ON DETERMINATION OF CHLORINE.—H. Pellet in "Bulletin de la Societe Chimique de Paris," 1877+28 p. 68, shows that in the titration of chlorine by means of nitrate of silver, with potassium chromate as indicator, that (the presence of) arsenic, arsenious and phosphoric acids, as also fluorides, does not interfere with the reaction. Hence, in determining chlorine in ash and the like, it is not necessary to previously remove phosphoric acid.

SEPARATION OF ANTIMONY AND ARSENIC.—The well-known method of Bunsen's for separating arsenic and antimony, by means of the insolubility of the sulphide of the latter (Sb_2S_3) in potassium disulphide, has been attacked by L. F. Nilson, a Swedish chemist ("Zeitschrift fur Analytische Chemie," 1877, S. 417.) He maintains that the antimonious sulphide is not insoluble in the reagent used, and that this (neat and useful) method is unreliable.

Mining Share Market.

Pacific Board—Latest Sales

Notwithstanding the eagerness with which the developments going on in the Savage and Julia have been watched, the past week has seen a steady and quiet market, all hold movements being kept in check by the uncertainties of the situation. With this tension very little of a determinate character would suffice to effect prices sharply. As explorations in these two mines progress this feeling of expectancy will be intensified until the denouement brings with it such a change of prices as only final results can effect. Meantime there is a growing confidence in the importance of the ore bodies crosscut in these mines. Great will be the disappointment should they ultimately fail to take on the genuine bonanza type; and while there is no certainty that they will do so, we have yet to be furnished with an instance on the Comstock belt in which these deep lying mineralized bodies have failed to afford large quantities of valuable ore. The theory that the ore now coming in on the 1600-foot levels of the Julia and Savage lies in a more easterly channel than that first opened on the Comstock appears to be growing in favor.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

BUTTE.

THE DREDGE BOAT.—*Mercury*, April 19: The mining boat owned by the Marysville company is now on its way down the river to ground owned by W. S. Higgins, where it will be put to work in the hope of striking it in paying quantities.

THE PROOF.—Gold is coming out of the mountains by the thousands each day that the stages comes into Oroville.

CALAVERAS.

SHEEP RANCH.—*Citizen*, April 13: This is an active and growing camp. The Sheep Ranch mines never ceases by night or day. This valuable mine now gives employment to more than fifty men—thirty of them working in the shafts by day, and about a dozen by night; the remainder are employed at the hoisting works, the mill, etc.

The Boston hydraulic company have a large force employed on Whisky hill. The immense reservoir in Salt Spring valley was filled during the winter and will furnish water to keep them at work all summer.

COMMENCED CRUSHING.—The new mill on the Hughes' mine near Chile gulch was started last week. A sufficient amount of ore, it is thought, will be obtained to keep the mill running continuously.

EL DORADO.

KELSEY.—*Mountain Democrat*, April 20: Quartz mining is receiving considerable attention. Things are being put in shape to further prospect the Chaparral mine, on which a good deal of work has already been done. Operations are in progress on the Ida Livingston, owned by San Francisco parties. Hoisting works with power sufficient to meet all demands has been erected, and no expense has been spared to thoroughly prospect this ledge.

ST. LAWRENCE.—There is a rumor that work on this mine is shortly to be resumed, only enough having been done here for some time past to keep it free from water. The present company have already expended considerable money upon it, and when we remember that in times past it proved a veritable bonanza to its owners—the present company also taking out ore which yielded handsomely—it seems entitled to a further trial.

THE CHURCH UNION.—This mine, near E Dorado, is looking better than ever before. The ledge is widening. They are drifting now on the 500 level and will soon begin sinking again. The mill will soon start to continue through the summer. Work will be resumed in the Pocahontas mine in a few days.

INYO.

BEVERIDGE DISTRICT.—*Independent*, April 13: The new gold district just across the summit from the Eclipse is attracting some attention. The first discovery was made in November last, by Wm. L. Hunter and others. The discoverers have kept a small force at work throughout the winter, and do not hesitate to pronounce the mines and whole district most promising. The snow is rapidly melting away, and as it goes the work of prospecting becomes possible. Up to the 8th instant 23 claims had been located, "each giving rich prospects of free gold." The country is well watered and timbered, and of the roughest description. Via Cerro Gordo is at present the only practicable route to the new mines.

NEVADA.

SELBY HILL.—*Transcript*, April 19: The claim on this hill worked for the past two years by hydraulic process, will now be worked by drifting, a tunnel having been run for the purpose and which has reached the rich channel. The reason for this change is that there was so much pipe clay in the claim, that it could not be worked by piping, this tenacious stuff carrying away so much of the gold. Drifts will be run from various points along the main tunnel, and the rich gravel, which is always found on the bedrock, will be stopped out, and washed in sluices, from which it will be pumped into a reservoir, where it will be allowed to slack for some time, when it will again be washed. The second washing yields nearly as much as the first.

THE BYRNE MINE.—*Grass Valley Union*, April 16: This mine on Gold Flat comprises 120 acres, 80 of which are gold-bearing gravel, through which runs a lead known to be rich from the ground that has been worked on the edge of the channel. The main features are the two quartz leads, the Potosi and Mohegan. The Potosi has been worked to the depth of 300 feet by one shaft, and 250 feet by another.

THE CENTENNIAL.—On the lower or 320 level of this mine rich rock is being taken out. The vein shows from ten to twelve inches in size, and regular. The Orleans mill will commence another crushing of ore from the mine next week.

PLACER.

REMINOTON HILL.—*Dutch Flat Forum*, April 19: The Rhode Island hydraulic mine is running off rich gravel. A small boulder was picked up in this claim lately that contained several hundred dollars' worth of gold. As the water here does not last long they will not clean-up till the end of the washing season, to

wards the close of next month. The Wide West drift claim is being extensively opened, working from 20 to 30 men and breasting out large blocks of good gravel.

LOWELL HILL.—At the Swamp Angel 25 men are being worked, drifting out very rich gravel. The East New York tunnel is completed a distance of 1,000 feet. The Planet tunnel is in 940 feet, and though now under the channel the incline will not be raised till the 1st of May. The Wild Cat tunnel is in 1,700 feet, and it is thought they are passing over the channel.

LIBERTY HILL.—The hydraulicing of the upper and lower strata in the Liberty Hill mine has been progressing steadily—washing night and day most of the time since January 26th.

DUTCH FLAT.—The Polar Star and Southern Cross, although not nearly opened as yet to be worked to advantage, surprised the managers at a recent clean-up by paying over running expenses. Seventy men are employed and 1,600 inches of water used alternately. The second clean-up was made in the Central mine last week, which resulted in the payment of a dividend of more than \$4,000. The Lekaup mine is run by a force of five men, and 350 inches of water. This is probably the only mine in the district where miners receive or are paid the old rats of wages. The Boston mine is not being worked through the bedrock tunnel for the present. A string of pipe 700 feet in length, is being laid for the purpose of working a large bench of gravel on the outside of the rim rock.

SISKIYOU.

THE EMPIRE QUARTZ MINING CO.—*Yreka Union*, April 13: The Empire quartz mining company have contracted for the iron work of the quartz mill they are going to erect at their mine, and building will soon be commenced and pushed ahead as fast as possible.

TUOLUMNE.

THE MINES.—*Independent*, April 20: At Columbia miners are obliged to watch their claims by night, in company with shotguns and pistols. A partial clean-up at Philadelphia diggings, on Friday, after 18 days' run, paid \$430.37. Twenty-four men are repairing the damage of last winter to the Phoenix reservoir. It may take them a month longer or more to finish. All the water the miners want this season can be furnished by the Tuolumne County Water company; enough until next winter.

NEW DITCH.—The Soulsby company have contracted for a new ditch to course around the mountain to run the works at their mine.

PLUMAS.

RUNNING FULL BLAST.—*National*, April 13: The miners almost all over the country are hard at it, having all the water they can manage. The big ditch is full, with a prospect of having plenty of water until the first of September. They are running the Metcalf and Haycock claims, on Gopher hill, the latter day and night, and will move a very large quantity of ground this summer. The claims are known to be rich and the company will certainly realize a large sum of money this year. At Hungarian hill the pipes are at work, but as their water comes from the north side of the mountain, it is still light. The warm weather, however, will soon bring it along, and there ground is sure to respond liberally. All the miners of the East Branch and North Fork have had water for some time and are making good use of it. Jo. Kelly came down from his Popular Creek mine on Thursday. He says work is starting up briskly in that section, and thinks that a rich mining district is sure to result.

The Bell's Bar blue gravel company are getting out the timbers for the engine house. The machinery is now at Reno, and will be shipped to the mine in a few days. They have fine prospects for a big paying mine, and think they will get it in a short time. The Blue Gravel company, near Nelson are said to be taking out rich dirt.

SHASTA.

FURNACEVILLE.—*Reading Independent*, April 18: The Afterthought company have got to work again; having added some new machinery, whereby they get, through the leaching process, much finer bullion than before. The ore continues good and plentiful. They have a good, well managed property and can hardly fail to do well. A large mill will be put up, this season, on the Peck mine.

COPPER CITY.—There are no idlers here, more houses are needed and the saw mill of the Extra mining company is kept busy furnishing lumber. This company are grading and laying the foundation of their mill, the location of which is very advantageous.

FROM WHISKEY.—Bell, Knox & Woodward, crushing with an arrastra, cleaned up, not long since, 160 ounces of gold. Since which they have cleaned up \$1,340, the result of 18 days' run. Mr. Stone is sinking a shaft on a quartz ledge, about 600 yards east of the above mine, and is taking out of the vein some very fine ore. Mr. Banghart is working a seam mine about one mile east, and it proves to be among the best paying gold mines in the county. Mr. Peckham, two miles further east, is working quartz that yields him \$40 to the ton.

HARDSCRABBLE.—Robt. Harvey is putting in another pipe to work the claim north of Hardscrabble, which until lately was worked by Chinamen.

Nevada.

WASHOE DISTRICT.

SAVAGE.—*Gold Hill News*, April 24: Superintendent Gillette returned the first of the week

from San Francisco, where he had gone to consult with the President as to what course he should pursue in the development of the ore discovered on the 1540 level. He at once started two drifts, one north and the other south, alongside and parallel with the ore vein. The drifts are on the west side of the ore and are not intended to cut the ore at all until a proper distance is reached on either side of where the ore was found, when the main drift will be again started up and the vein be cross-cut at the same time both north and south of where it was first struck. At present nothing more is known of the real value of the strike than was known a week ago. The east drift on the 2000 level is steadily advancing, the face now being in much softer ground.

OPHIR.—Sinking the winze below the 1900 level is going steadily ahead, the bottom still in vein porphyry, the ore having passed out on the east side of the winze. A considerable quantity of quartz and vein matter has been passed through by west crosscut No. 4 from the east lateral drift on the 1900 level. The east drift on the 1800 level is now in 427 feet, having passed the point at which the new ore vein should have been found, if it extended up to that point, without developing anything of value.

CALIFORNIA.—Daily yield, 650 tons of ore. Good ore is being taken from every breast from the 1500 down to the 1750 levels. On the 1950 level the east drift is steadily advancing, the face still in dry vein matter showing some very fine stringers of quartz. A drill is kept well in advance in this drift to prevent a sudden influx of water, as this drift is some distance below the depth yet attained by the C. & C. shaft. The south drift on the 1750 level is still advancing in good ore. Another east crosscut, No. 6, has been started on this level, which is now in 26 feet, the face in vein material.

CON. VIRGINIA.—Daily yield, 600 tons of ore. On the 1850 level the crosscut west from No. 2 winze is being steadily advanced, the face still in vein material. No work is now being done in the main south lateral drift on this level. On the 1750 level a crosscut east has been started to prospect the ore vein opposite where the station was cut out for making the upraise to the level above. The face of this drift is still in vein matter.

JUSTICE.—The ore is being closely assorted as it is taken out, and about 130 tons daily shipped to the Pacific mill, which is kept steadily running. The ore stops from the 800 down to the 1000 level continue to show well, and yield good ore. The two east crosscuts on the 1000 level in the southern portion of the mine, are steadily advancing, and show some very favorable bunches of good ore.

YELLOW JACKET.—Sinking the new shaft is making excellent progress, the bottom in good working ground. It is now down 1,400 feet. The erection of the new pumping machinery is going steadily forward.

GOULD & CURRY.—The water is entirely drained from the 1900 level, and clearing out and repairing the south drift connecting the Savage joint winze below the 1900 level, is being pushed ahead with steady vigor, notwithstanding the intense heat.

CHOLLAR COMBINATION SHAFT.—Sinking the Chollar-Norcross-Savage shaft is being pushed ahead at a steady and very rapid rate. It is now down 2,135 feet, the bottom in porphyry that blasts well.

BEST & BELCHER.—Some quartz of a very favorable look has been passed through the past week while sinking.

OVERMAN.—Sinking the main shaft is making the best of progress, the bottom in good blasting ground. It will be down to the 1600 level by Saturday next, if nothing unusual happens to prevent. The face of the east drift on the 1100 level is showing some stringers of good quartz, although it is not in far enough yet to strike the body of quartz and ore found in running the east drift on the 1200 level.

LADY WASHINGTON.—The north drift on the 1000 level is steadily advancing along the foot wall of the ore vein, the face still in quartz and vein matter of a most favorable character.

BULLION.—The east drift on the 1840 level is being pushed vigorously forward, the face in quartz and vein matter of a better description than anything that has heretofore been found on this level of the mine. This quartz is entirely to the eastward of all the old workings, and is something entirely new.

JULIA CON.—The south drift on the 2000 level could hardly make better progress. It is being advanced at the rate of eight feet per day, and is following the west wall of the ore vein.

BELCHER.—Sinking the main incline is going steadily ahead, the bottom in good blasting ground. It is now down 135 feet below the 2260 foot station, and is being pushed vigorously downward to reach the 2360 level. The station for the winze below the 1900 level to connect with the south drift on the 2160 level is finished and the sinking commenced. Otherwise no changes of importance to note.

GOLDEN STANDARD.—This mining claim consists of 1500 lineal feet, lying just east of and parallel with the Homestead mine, Gold Hill. It is being opened and developed by the joint improvements and excavations of the two mines, and the Wheeler, near by.

WARD.—The west drift on the 1050 level is steadily advancing, the face in vein matter carrying quantities of quartz gravel of a very favorable look.

LEVATHAN.—During the week an increase of

quartz in streaks has manifested itself in the incline below the 600 level.

CALDONIA.—The face of the main north drift on the 1000 level continues in lively vein material. The east crosscut on this level has passed through the belt of hard rock recently encountered and is now in a much softer and more favorable character of rock.

SUTRO TUNNEL.—Important ore developments are to be expected at almost any time, for the tunnel has arrived nearly to its destination. Total length, last evening, from mouth to face of header, 19,489 feet.

CROWN POINT.—The connection by means of the north drift with the Yellow Jacket mine is now completed and this drift in good working order. The main south drift on the 500 level is steadily advancing, without any change of interest to report.

NEW YORK.—The face of the north drift on the 1000 level continues in a splendid character of quartz, which shows occasionally small streaks of good ore.

HALE & NORCROSS.—Everything is working well and draining the water is making better progress to-day than it has ever done since it was first tapped.

ALTA.—The north drift on the 1150 level is being steadily advanced, the face still in quartz and ore. The west drift on the 1250 level is rapidly approaching the main ledge, and some lively developments may be looked for on that level soon.

SIERRA NEVADA.—The new station in the south winze at the 2000 level is about completed. This is being opened in very favorable vein matter.

SUCCOR.—The northwest drift on the 1050 level is steadily advancing, the face in quartz and vein matter of a very encouraging character.

MEXICAN.—The joint east drift on the 1600 level is being steadily advanced, the face in very favorable working ground.

UNION CON.—The joint east drift on the 1600 level is being pushed vigorously forward, the face in a good character of vein material.

AURORA DISTRICT.

WILL BE A GOOD CAMP.—*Elko Post*, April 6: Parties who have lately visited this locality have favorable opinion of its future. No considerable amount of work has been done on any claim in the district, but the ledges are large, the ores very rich, and many of the claims which have been located and recorded will be developed during the coming season. The most prominent mine there is the Astor, formerly known as the Aurora. No work is being done on it at present, owing to a suit for possession now pending in the District Court at Elko.

BELMONT DISTRICT.

THE MINES.—*Courier*, April 6: In the El Dorado South a fine body of ore has been uncovered in the 950 drift, car samples assaying from \$250 to \$300 per ton. Drift No. 2, north end of the Belmont mine, will produce many hundred tons of first class ore. Rich sulphurets and antimonial silver are being developed in considerable quantity in other parts of the mine, the prospects of which are now considered excellent.

KEPT GOING.—*Courier*, April 13: Work on the El Dorado South and Belmont is steadily advancing, with improving prospects. Both companies are extracting rich ores, rendering it advisable that one of the 20-stamp mills should be started up. With the ore afforded by these two mines and what the chlorides can furnish, the mill could be kept running constantly. As soon as they commence to ship bullion, capital will seek investment in those mines which have lain idle so long in this section.

EUREKA DISTRICT.

NOTES ON THE MINES.—*Sentinel*, April 12: Over 200 men are employed at the Richmond furnaces and refinery, and that place is about as busy a locality as can be found in this section of the country. Capt. Foley is engaged in developing some new locations at Secret canyon, and is confident that he will encounter good mines at that point. The Richmond furnaces are averaging an output of 50 tons of crude bullion daily. The ores carry a very high percentage of lead. As soon as the necessary connections can be made the Connolly mine will ship large quantities of ore to the Richmond furnaces. Work is being renewed with vigor on a number of the small mines on Prospect mountain, where operations during the winter were retarded by the heavy snow fall in that locality. The Hamburg company will probably build smelting works this summer on their site in Eureka canyon. The sinking of the shaft at the Gray Eagle is being rapidly pushed, and the developments are looked upon as most favorable. Developments in the Palisade coal mine still continue, and the stockholders are confident that they are the owners of a first-class property. From 15 to 25 car-loads of lead and crude bullion, aggregating over 1,200 tons, are shipped from Eureka every week, the value of the refined bullion shipped weekly by express amounting to about \$150,000.

EUREKA CON.—*Sentinel*, April 19: The ore body on the seventh level is improving in quality, and promises to be one of the most important developments ever encountered in the mine. They will build an additional furnace of the old style very soon, the mine being able to supply any quantity of furnaces with ore.

THE HAMBURG.—The dumps are full of ore, and a large quantity is broken down in the mine that has not been hoisted to the surface.

Continued on page 268.

The Medicinal Springs of California.

From an interesting article in the *Pacific Medical and Surgical Journal* for April, written by John S. Hittell, we present the following extracts: Mineral springs are more abundant in California and Nevada than in any other equal area in the civilized world, and will probably at no distant time attract many visitors and be of much interest to pleasure seekers, invalids and the medical profession. They are especially numerous in the coast mountains and valleys for a distance of 100 miles northward from San Pablo bay (a branch of San Francisco bay), about Mount Lassen, and at the eastern base of the main ridge of the Sierra Nevada, near the Oregon line. These districts were the sites of great volcanic activity in a remote age, and the subterranean heat comes near to the surface now. At the Geysers large quantities of hot steam rise constantly from blow-holes; and at the Sulphur Bank, near Clear lake, the earth at a depth of a few feet is scalding hot. Many of the springs are warm, or hot, are strong with different mineral combinations, so that when they shall have been fully examined they may be found as valuable for the cure of disease as all the mineral waters of the Atlantic States and Europe together. As yet, scarcely a score have been analyzed.

For the purpose of presenting in a convenient shape such knowledge as is now obtainable about the California mineral springs that have been analyzed, I have prepared some tables, in which the waters are classified according to their predominant qualities, and placed alongside of European springs which have gained a reputation in the course of ages for their curative power.

The leading

Classes of Mineral Springs

Are the alkaline, with carbonates predominant; the saline, with chlorides; the chalybeate, with a good proportion of iron, and weak otherwise; the purgative, with sulphates; the sulphur, with an odor of sulphur, and without much strength in either carbonates, chlorides or sulphates; and the thermal, which are prized mainly for bathing purposes. Springs of all these classes, save the purgative, abound in California and Nevada, and probably after more have been examined, purgative springs will be found too.

The following is a table of the number of grains in a gallon of the water of alkaline springs. Wherever in that or the following tables, the quantity of any solid given is less than half a grain, the amount is indicated by an asterisk. The quantity of gas is given in cubic inches. The name of the chemist making the analysis is given, if known.

CONSTITUENTS.	Vichy (Rouge)	New Almaden	Ems (Fresenius)	Etna (Fresenius)	Alma (Fresenius)	Alma (Price)	Sanel (Bauer)	Congress

The carbonates of soda in the New Almaden, Etna and Sanel, the carbonate of magnesia in the Etna, and the carbonate of lime in the New Almaden, in the above table, are double, or bicarbonates. The Vichy water is, for a large class of diseases, considered the best in the world; that is, it is the best known as having been effective in a large number of cases. It is especially valuable in dyspepsia, disease of the liver, diabetes, gall stones, gout and paludal cachexia. Large quantities of it are sent, in barrels and bottles, to distant places, some of it coming to the shores of the North Pacific. The waters of Fachingen differ considerably from those of Vichy, yet are found effective in the same kinds of disease. The Ems water is useful in chronic bronchitis, granular pharyngitis (clergyman's sore throat), and catarrhs of the stomach, hepatic ducts, bladder and uterus. When drank in excess it causes constipation and inflammation of the stomach. It will be observed that the New Almaden spring, sixty miles south of San Francisco, has a close resemblance to the Vichy; and the Etna, in Pope valley, seventy miles north of San Francisco, to the Ems.

The New Almaden spring has attracted few visitors. The Adams, which for several years past has attracted more visitors than any other Californian spring that has been analyzed, is decidedly inferior to the New Almaden or the Etna. The last, at the eastern base of Mount St. Helena, in a little valley surrounded by mountains, with shade, game, beautiful walks, drives, and abundant water, 18 miles from a railroad station, is well fitted to be a favorite resort for poor as well as rich invalids. The Congress spring at Saratoga, 60 miles south of San Francisco, might be classed with the chalybeates, though I have preferred to put it with the alkaline. It has excellent qualities, but its fitness for daily use by persons in good health is doubtful, though much of it, after having

been artificially filled with carbonic acid gas, is sold for that purpose. As an alkaline chalybeate I do not know of its equal.

It will be observed that in some springs carbonates are reported, in others bicarbonates. Wherever there is free carbonic acid, most of its salts are bicarbonates, but some chemists reduce them to carbonates. Eighty-four grains of carbonate of soda contain as much soda as 100 of the bicarbonate, and the other 16 grains of carbonic acid equal to about 16 cubic inches, may be counted as part of the carbonic acid gas.

The following are the leading chalybeate and thermal springs of Europe and California:

Constituents.	Schwalbach (Fresenius)	Spa (Fresenius)	Napa Soda (Fresenius)	Geyser (Fresenius)	Lifton (Skaggs)	Gastin (Wolf)	Schlangenbad (Fresenius)	Calistoga
Carb. Soda.....	1	1	13	23	24	2	1	3

The carbonates of soda in the Napa, Geyser, and Skaggs, and the carbonate of magnesia in the Geyser and Skaggs springs are double or bicarbonates.

The best chalybeate springs of Europe are those of Schwalbach and Spa. The former, besides the component parts mentioned in the table, has traces of phosphate and borate of soda, and carbonate of magnesia, of which the last two are regarded as inert, and the former as of little effect. The chalybeate waters are prized as remedies for anemia, chlorosis, and all diseases curable by mild tonics. Cheltenham, called the best chalybeate of England, has three grains of carbonate of iron, and 129 of sulphates of magnesia and soda, and 330 of chloride of sodium, to the gallon, so that the purgative and saline qualities are far stronger than the chalybeate.

The Skaggs and Geyser springs have very good qualities, but I regard the Napa soda as the best chalybeate water known. It has more iron than any other springs the analysis of which I have seen. It has little inert material, and its active salts are good in their kind, amount and proportion. The quantity of carbonic acid gas is not reported, but it is abundant. The spring is covered by a copper vessel, into which the gas escapes, and from which it is pumped into a machine, which again forces it into the water before bottling. About 720,000 bottles of it (equal to 45,000 gallons) are sold annually in San Francisco, where it is consumed largely as a pleasant beverage, and a check upon the after effects of distilled and fermented liquors. The spring is situated about 35 miles north of San Francisco, and 1,000 feet above the sea, on the western slope of the mountain ridge east of Napa valley, commanding an extensive and charming view. The place has many advantages for the fashionable pleasure resort which it will in time become. It is not yet prepared for the general reception of visitors, though many go there. A chalybeate spring at the Geysers, 100 miles north of San Francisco (but which one of the hundred springs at the Geysers, the proprietor of the place does not know), has excellent chalybeate water, fully equal, I think, to either Schwalbach or Spa. The presence of a small quantity of sulphate of soda in the three chalybeate springs of California above given, is an advantage over their European rivals. There is suspicious similarity in the figures of the Skaggs and Geyser springs.

The most noted European thermal springs, that is, warm without any strong mineral character, are Gastin and Schlangenbad. The former has a reputation for curing paralysis, chronic rheumatism, and certain forms of weakness; the latter for skin diseases, rheumatism, gout, hysteria, and erythema of the nervous system. The Calistoga water bears a close resemblance to them, and is doubtless equally good for drinking, while for bathing, on account of its larger proportion of chlorides of sodium and lime, it should be better. It will be observed that Vichy, which is drank in large quantities, has twice as much chloride of lime as Calistoga. The temperature is also better than that at Schlangenbad, and has very nearly the best degree of warmth for a thermal spring.

The following are the

Leading Sulphur Springs:

Constituents.	Aix-la-Chapelle (Fresenius)	Aix-la-Chapelle (Fresenius)	Bagnères-de-Luchon (Fresenius)	Paso Robles No. 1 (Fresenius)	Paso Robles No. 2 (Fresenius)	White Sulphur No. 6 (Fresenius)	White Sulphur No. 7 (Fresenius)	White Sulphur No. 2 (Fresenius)

The carbonates of soda and magnesia in Paso

Robles spring No. 1, are double or bicarbonates.

Aix-la-Chapelle is noted for the cure of chronic rheumatism and diseases of the skin; Aix-les-Bains for chronic rheumatism, diseases of the skin, syphilitic complaints and paralysis; and Bagnères-de-Luchon for scrofulous and syphilitic affections (for these latter the best in Europe), pustulous eczema, psoriasis, pityriasis, ichthyosis, rheumatism and old wounds. The last spring is very weak in its mineral character, and probably owes a large part of its efficiency to its high heat and its extensive use for bathing. Aix-la-Chapelle contains traces of iodide and bromide of soda, and Aix-les-Bains has traces of iodide of potash and sulphate of alumina. There are also traces of iodine and bromine in Paso Robles No. 2 (the mud spring), and they give that spring a superiority for diseases, and rheumatism resulting from them, over any other yet analyzed in California. The White Sulphur spring No. 2, has 6 cubic inches of sulphureted hydrogen in a gallon; No. 6 has 4 inches, and No. 7 a trace. These waters are good for skin diseases. It is probable that if the White Sulphur water were heated to 115° it would be fully equal to the Bagnères-de-Luchon; but there are numerous sulphur springs of similar composition in California, and hot enough by nature.

EUREKA MONTHLY BULLION. — During the month of March, Eureka district shipped abroad bullion valued at \$439,750. In the same period the Richmond company shipped fine bars valued at \$173,789.44, making our total treasure shipments for the month \$613,539.44. This sum does not represent the total yield of the district, as the Richmond furnaces turn out crude bullion much faster than the refinery is able to separate it, and there is now stacked up at the works nearly 3,000 tons of bullion awaiting that process. The gross yield is something over \$800,000, the output of eight furnaces. The shipments of refined lead and the lead contained in the crude bullion will aggregate 3,000 tons, which, estimated at its present value—\$75 per ton—would add \$225,000 to the above, and make a grand total of something over \$1,000,000, which latter amount may be set down as our regular monthly contribution to the wealth of the world. There was also received and forwarded during the month, through Wells, Fargo & Co., bullion to the amount of \$174,346.92, the same being a portion of the product of the several districts south of this point.—*Eureka Sentinel*.

DEEPEST VERTICAL SHAFT IN THE UNITED STATES.—The Combination shaft is down 2,060 feet, and is now the deepest vertical shaft in the United States. It is intended to sink it vertically to a depth of 3,000 feet, at which point it is expected to intersect the Comstock lode. This will make it as deep as the deepest vertical shaft in the world. When the shaft shall have attained a depth greater than the lowest levels of the Savage and Hale & Norcross, a drift will be run from it to draw off any water there may be in those mines. This connection may be of great value in many ways, particularly in ventilating the lower levels, thus allowing a new departure to be taken from them to still greater depths. As often as may be considered necessary, other drifts may be run from the shaft to the lode. As the lode is dipping toward the shaft the distance, it will be necessary to drift to make the connection will constantly be growing shorter.—*Territorial Enterprise*.

WOOD IN WASHOE.—There now remains at the wood yard, at Huffaker's station, about 5,000 cords of wood. The flume at that point will resume operations about the first of June. There are in the mountains about 75,000 cords of wood to be sent down this flume. The flume at Washoe City is to be abandoned, there not being enough wood at its head to justify keeping it up. The greater part of the wood supply this summer will come from above the Clear creek country, satisfactory terms having been made with Yerington & Bliss and other large wood owners in that direction by the bonanza people. It is said that there is in this part of the Sierras, wood that has been cut and corded up for the past five years. It should be good and dry by this time.—*Territorial Enterprise*.

DEATH OF A GIFTED MAN.—A note from a member of Lieut. Wheeler's surveying expedition, received yesterday, informs us of the death, in Washington, week before last, of Dr. F. Kampf, astronomer for Wheeler's expedition. He was kicked in the forehead by a mule in Ogden, Utah, last fall, and the injury finally resulted in his death. Dr. Kampf was in this city some weeks two years ago, and endeared himself to a multitude of people. He was one of the most genial of gentlemen, and was full of the eccentricities which often attend upon genius. He was probably the foremost mathematician in the United States; a wonderful scholar in many respects, and his death is as much a loss to science as it is a sorrow to the gifted man's wide circle of friends.—*Territorial Enterprise*.

A NEW TAX.—A law passed by the last Legislature requires the secretaries of all corporations to collect 10 cents on each certificate of stock issued, whether as original or transfer shares. It is estimated that the tax will amount to \$50,000 or \$60,000, all of which goes into the General Fund of the city. Secretaries failing to make proper returns to the Tax Collector will be liable to punishment for misdemeanor.

More Economy Required in Mining.

The immense quantities of smelting ores found in Montana—ores that cannot be reduced by mill process with a profit, if at all—makes the subject of smelting one of great importance to many in the Territory. Numerous furnaces have been erected at considerable cost and all have been run with more or less success, but to our knowledge only one—the Hecla company's at Glendale—has been kept continuously running. There have doubtless been many causes that have conspired to make these enterprises almost total failures. In one case it was bad management; in another, lack of capital; a third, lack of suitable ores in proximity to the smelter; and another, that no clay could be found for lining the furnaces that would stand the immense heat to which it was subjected. These are but a few of the many causes that have been assigned for failure. But in our opinion there are other causes that have had an equal or greater bearing upon the subject than those enumerated. They are defective furnaces and a lack of the requisite knowledge of the proper treatment of the ores. The smelting of ores has been very successfully carried on in Utah and Nevada, but even with the vast amount of experience that has given those operators their present success, it must be confessed that they have much to learn, as the ores that are most successfully manipulated do not yield a very large percentage of their assay value. The amount lost in the slag is simply enormous. But even free smelting ores constitute but a tithe of the ores in those regions where smelting is now so successful. What is wanted is the discovery of some process whereby the free ores can be worked closely and the rebellious ores treated with success. Many are the experiments that have been made to solve these problems, and much money has been uselessly spent in the effort, but so far without marked success. The Nevada papers of a recent date speak very encouragingly of a new process that has been tried on a small scale at Reno. They claim that the Schively brothers have been experimenting upon the most rebellious ores that could be found—ores that have resisted all efforts at successful reduction during the past 10 years—and that they have succeeded so perfectly that not a trace of the precious metals can be found in the slag. If further tests are as successful it will be the dawn of a new mining era in that State, as the quantity of rebellious ores there is almost limitless.—*Montana Independent*.

PIG LEAD FROM FUMES.—The Joplin (Mo.) *Mining News* explains its recent statement that pig lead is being made from smoke as follows: In the process of smelting the ore a great deal of it escapes in the form of smoke, or lead fumes, as it is more properly termed. It has been known for years that a large per cent. of the metal was thus lost by its being sublimized and passing off into space. The white lead company was formed for the purpose of catching this smoke and by passing it through an almost endless line of pipes of sheet iron and woolen bags, condense it. The result was that after an outlay of many thousand dollars and a year's experimenting they have succeeded in condensing the smoke, or lead fumes, into metallic lead, the same as steam is converted into water. The product of the fumes is a bluish, impalpable powder, which makes a splendid blue paint, pronounced equal to the corroded article. For the purpose of making it white several furnaces were built, and the blue product, with the aid of an immense heat, is again changed into lead fumes, which is again condensed and comes out pure white lead. In the transforming of the blue lead into fumes, considerable pig lead is made. The object is to sublimize it all, but the heat is not powerful enough to do so.

PROGRESS OF ARIZONA.—The onward progress of Arizona to increased population, wealth and internal development, meets with no untoward interference. The Southern Pacific railroad begins to feel the impetus of the hot breath of prosperity from across the Colorado. The result of this year's business will show a marked improvement over that of the previous one, with excellent prospect of steady continuance in well doing. The population of Arizona presents a rapid and most satisfying increase. The *Arizona Enterprise*, in a short editorial, says: "We do not go beyond proper bounds when we say that the population of Yavapai, Yuma, Mohave, Pinal and Maricopa counties is now double what it was two years ago, and that in less than six months Yavapai will have a population of 25,000 souls. The population of Pima is also on the increase. A gentleman from the East, via the 35th parallel route, says he passed more than 500 people coming this way. A great many people are also en route from California, Oregon, Nevada, Utah, Washington and other States and Territories, with the intention of settling in middle and northern Arizona."

RAILWAYS IN PORTUGAL.—Of all governments in Europe, Portugal is paramountly developing her railroad system to a very great extent, so as to improve and extend the various resources of that small but very fertile and promising country—which under her present minister of public works, Sr. Lourenco de Carvalho, is making very rapid progress—so as to bring the agricultural, the vinicultural and mineral wealth of the nation into a prosperous and profitable development.

Northwestern Arizona.

Touching this region of country, its towns and mines, a correspondent of the Prescott *Enterprise* writes as follows:

Between Mineral Park and Signal is a splendid stock country, yet not to exceed 10,000 head of cattle eat the nutritious grasses so abundant, and which would keep fat and frisky many thousand head.

About 30 miles north of Signal, on Sandy creek, the traveler commences to pass well cultivated ranches. The soil along this creek is rich, there is plenty of water for irrigation, and the climate is so mild that almost everything that is cultivated in California would do well here.

Signal does not at first strike one favorably, but the town is but a few mouths old and lumber for building is scarce. The population is about 1,000, with but a small proportion of women and children.

There are three mills here—40 stamps in all: The McCrackin 20-stamp mill, McCrackin 10-stamp mill (three miles above town), and the Signal mill of 10 stamps.

The McCrackin is the principal ledge in the district (Owen), though there are a number of large and well defined ledges which, when opened up, may prove to be equally valuable.

The deepest shaft on the McCrackin mine is about 450 feet, but, strange to say, the width of the ledge has never yet been determined. It is believed to be about 80 feet. Breasts of ore 40 feet in width have been taken to the mill and worked without sorting, yielding \$75 per ton. None of the ore taken out is sorted, and the 20-stamp mill crushes in the neighborhood of 100 tons per day. It is free milling ore, similar to that of the Comstock, very easily crushed and the average yield is about \$75 per ton.

The Signal mine is on the same ledge, the ore of like character and of equal value; but the body of ore is not so great as on the McCrackin. The Signal mill gets away with about 45 tons per day.

The McCrackin 10-stamp mill is now running on tailings, but when it is turned loose on ore fresh from the mine will pound the silver out of about 40 tons every day. So the bullion yield of this district will this year amount to several millions of dollars.

The mills are 12 and 15 miles from the mines, and I believe the ore is delivered for about \$5 per ton. Lots of water for milling purposes; wood \$5 per cord.

RECKLESSNESS OF COLLIERIES.—This is proverbial, and is fully sustained in the following items of recent date: "T. Christopher went to work at the Heskin Hall colliery with his son. When they reached the place where they should have begun work, they found the rails pulled up, as a signal of danger; but nevertheless, the miner went forward with a lighted candle to fetch his tools out of the working, and directly he reached it, there was an explosion of gas and he was so badly burned about the body that he died." "Two colliers were brought to court; it appears that they took down into the pit a quantity of loose powder in a bag, and in the most reckless manner placed it close by the side of a lighted candle. Shortly afterwards part of the lighted 'snuff' of the candle fell on the bag containing the powder, but very fortunately the spark was discovered and extinguished just in time to prevent an explosion. Both of the defendants pleaded guilty, and were fined £2 each and costs, or one month's imprisonment with hard labor. At the same court three colliers, were charged with having rendered useless a ventilating door in a mine by propping it open. They were fined 10s. and costs or 14 days imprisonment."

THE HACKBERRY MINE.—Latest advices from this property, situated in Mohave county, Arizona, are highly encouraging. The main shaft is now down nearly 450 feet. Various other shafts of lesser depth open up the mine for a length of 600 feet. All the shafts and levels are showing increased bodies of high-grade ore. The new mill is nearly completed and will soon be pounding out the bullion. There are 1,000 tons of ore now on the dumps, which, it is expected, will mill some \$200 per ton, and 4,000 tons in eight of equally good ore. A new set of hoisting works are also in process of erection at the mine, with a capacity to sink 1,500 feet. —*Yuma Sentinel*.

TERRA COTTA AND FIRE BRICK.—The Antioch *Ledger* says: I. Nicholson, proprietor of the Albion Pottery, shipped \$1,000 worth of stoveware to San Francisco, on Wednesday. Our hills contain unlimited quantities of valuable clays, which, with present facilities for shipment and cheap fuel, will lead to extensive manufacture of pottery ware and terra cotta work, as the State increases in population and the demand increases.

THE PARADISE VALLEY MINES.—Experts, who have visited these mines, express themselves to the *Silver State* as being favorably impressed with the prospects. They say the ledge crop out bold and strong, and while there is not sufficient work done to enable even experts to form a decisive opinion, they have not much doubt of their richness and permanency.

THE OLD RUBY MOUNTAIN MINES.—The *Eureka Republican* has good reports from these mines, in White Pine county. The Blackfoot and Crown Point ledges show especially good indications.

USEFUL INFORMATION.

TO PREVENT HONEYCOMB IN CASTINGS.—Mr. John Bourne, C. E., of Mark Lane, London, has patented a device to prevent honeycombing in castings, by which he extracts from the metal, while in the molten state, the gas or gases by which the honeycombing is produced. The removal of the gases may be effected by the aid of any mechanical means capable of producing rarefaction, such as a common pump, an exhausting jet of steam or other fluid, the hydrostatic gravitation of a column of the molten metal itself, or any other exhausting expedient, by which a vacuum more or less perfect is produced. The molten metal must be exposed to the action of the vacuum in such a manner as to insure the disengagement of the gas from the metal, and for this purpose he submits the metal to the vacuum preferably in a state of minute subdivision. This may be accomplished by allowing the molten metal to run through perforations in a fire-clay block into a tall cylinder, within which a vacuum is maintained. By thus subdividing the metal, and discharging it in the form of a metallic rain into an exhaust chamber, the gases are separated from the metal, and are sucked away by the pump or other extractor in communication with the exhaust chamber. He remarks that it is not intended to subdivide the molten metal (without the aid of a vacuum), for the removal of the gases, nor to attempt to suck away the gases from a vessel filled with molten metal by producing a vacuum above the metal, as the hydrostatic pressure of the metal itself would, under such circumstances, retain the gases within the metal, notwithstanding the existence of the vacuum above it; but he extracts the gases by the conjoint action of the vacuum and of the subdivision, as above explained, or by analogous or equivalent means embodying the same conditions.

BILLIONS AND TRILLIONS.—The ocean (says the "Cyclopædia Britannica") contains 290,000,000 cubic miles of water. Each cubic mile contains 5,431,776,000 cubic yards. Therefore, in round numbers, the ocean contains 5,400,000 billion, or 1,620,000 billion cubic yards. Therefore, 1,620,000 cubic yards is one-billionth part of the ocean. Now 162,000x10 yards represents a pond 30 feet deep and about 33 acres in superficial area, or to put it in another way, a pond 1,620 yards long and 100 yards wide. Roughly, if the Serpentine were 30 feet deep, it would be about a billionth part of the ocean. The "Cyclopædia Britannica" also tells me that a millimeter cube contains 5,000,000 blood corpuscles. If so, a square meter of the thickness of one millimeter must contain 5,000,000x1,000,000, or 5,000,000,000 blood corpuscles; and a cubic meter would contain 5,000 billions of them. Neglecting the difference between meters and yards, the ocean would contain 1,620,000 billionx5,000 billion or 8,100,000,000 billion, or eight thousand one hundred million trillions of blood corpuscles. How much blood there is in an average man I do not know, but certainly much more than would cover a square meter to the depth of a millimeter, so there must be in each of our veins a good many billions of blood corpuscles.

URANUS.—The planet Uranus is now very favorably situated for observation, though, except with a powerful telescope, there is very little to observe. It is at present easily detected by the naked eye on a dark night, being the eastern of two faint stars, which lie about 1½° northeast of the bright star Regulus. To the telescope it presents a pale bluish disc, about one-fourth as large as that of Saturn, without markings or spots of any kind. Telescopes less than eight inches in diameter would have no chance to show any of its satellites. With instruments of nine to 10 inches aperture, a fairly good eye can, under favorable circumstances, see the two outer ones, Oberon and Titania, though, to make measurements of their position, would require a still larger aperture. The two inner satellites, Ariel and Umbriel, are beyond the reach of all but the most powerful telescopes. Even with the great Washington Equatorial they cannot always be seen.

DEPOSITS OF NITRATE OF SODA.—The government of Chile have just issued documents setting forth the recent discovery of large deposits of nitrate of soda and of guano in the vast desert of Atacama, which lies between the 23d and the 27th parallels of latitude, and extends along from the coast line to the base of the Andes. The nitrate of soda is described as of great richness, and the deposits of guano will bear comparison with those of Peru both in their quality and quantity. At present these sources of wealth can be turned to little practical account, owing to the want of means of communication, but the government have determined to set about the construction of roads and the preparation of a port upon the coast, and have already directed the establishment of settlements in different parts of the desert.

POURING LEAD.—Many mechanics have been sorely tried when pouring lead around a damp or wet joint, to find it explode, blow out, or scatter from the effects of steam generated by the heat of the lead. The whole trouble may be stopped by putting a piece of resin, the size of the end of a man's thumb, into the ladle and allowing it to melt before pouring.

BRITAIN'S IMPORTATION OF FOOD.—A late issue of the London *Times* contains an interesting compilation of statistics, showing the aggregate sum expended by England for food from abroad, from which we glean that the amount paid in the year 1877 to foreign nations for corn, cattle and meat was \$484,308,685, to contrast with \$435,646,930 in 1876. For live stock the sum disbursed was, in 1877, \$30,078,450 as against \$36,301,515 in the preceding year—the prices paid being somewhat lower last year than the year before. The sums for fresh meats were much larger, consequent upon the shipment from the United States and Canada of quantities of beef and carcases of mutton. The total sum paid for foreign stock alive and dressed was, in 1877, \$86,568,370; in 1876, it amounted \$96,152,275. For corn, the sum paid last year was \$315,961,120; in 1876, \$257,673,240. Foreign butter cost in 1877, \$47,691,525; cheese, \$23,840,266; and eggs, \$12,362,406, to be compared, respectively, with \$48,513,120, \$21,257,140, and \$13,051,655 in 1876. The British demand for American butter and cheese is constantly increasing.

GERANIUMS AND SNAKES.—We lately read an account of a mining locality in Calaveras county being infested with snakes. In this connection we may observe that the report is that every species of snake may be permanently driven away from an infested place by planting geraniums. In South Africa the Caffir people thus rid their premises of snakes. A missionary of South Africa had his parsonage surrounded by a narrow belt of geraniums, which effectually protected the residence from any kind of snake. A few yards away from this geranium belt a snake would occasionally be found. It is well known that the whole geranium genus is highly redolent of volatile oils—lemon scented, musk scented, and peppermint scented. What, therefore, is a very pleasant nose-gay for man is repugnant to the serpent tribe.

ICE.—Ice did not become an article of commerce until the present century; but already in the United States alone \$30,000,000 are invested in the business of gathering and selling it. There has been a remarkable increase in the use of the article in the United States since 1845, when only 50,000 tons of it were used. In the year 1876 the consumers bought 2,500,000 tons, and probably 5,000,000 tons were cut. Beer brewers are the best customers of the ice companies, several using 30,000 tons of ice annually.

TO RESTORE MAHOGANY POLISH.—One gill of raw linseed oil, one pennyworth of butter of antimony, and one tablespoonful of vinegar; put in a bottle and shake before using.

GOOD HEALTH.

Wearing the Beard.

Hair is nature's protector against cold. Our beneficent Creator does nothing in vain. Rowland says on this subject: "It may be safely argued as a general physiological principle that whatever evinces a free and natural development of any part of the body, is, by necessity, beautiful. Deprive the lion of his mane, the cock of its comb, the peacock of the emerald plumage of its tail, the ram and deer of their horns, and they not only become displeasing to the eye, but lose much of their power and vigor. And it is easy to apply this reasoning to the hairy ornaments of a man's face. The caprice of fashion alone forces the Englishman to shave off those appendages which give to the male countenance that true masculine character, indicative of energy, bold daring and decision. The presence or absence of the beard, as an addition to the face, is the most marked and distinctive peculiarity between the countenances of the two sexes. Who can hesitate to admire the noble countenance of the Osmanli Turk of Constantinople, with his un-Mongolian length of beard? Ask any of the fair sex whether they will not approve and admire the noble countenance of Mehmet Ali, Major Herbert Edwards, the hero of the Punjab, Sir Charles Napier, and others, as set off by their beard? We may ask with 'Beatrice,' 'What manner of man is he? Is his head worth a hat, or his chin worth a beard?' I have noticed the whiskers and beards of many of our most prominent physicians and merchants encroaching upon their former narrow boundaries, while it is well known that not a few of our divines have been long convinced of the folly of disobeying one of nature's fixed laws; but hitherto their unwillingness to shock the prejudice of their congregations, has prevented them from giving effect to their convictions. The beard is not merely for ornament, it is for use. Nature never does anything in vain; she is economical, and wastes nothing. She would never erect a bulwark were her domain unworthy of protection, or were there no enemy to invade it."

HOW POISONS ARE SPREAD.—Mr. G. Owen Rees, Consulting Physician to Guy's Hospital, London, has called public attention to some unexpected sources of arsenical poisoning. The green calico lining of bed-curtains has been found to have produced, for months, severe symptoms, which were treated as those of natural disease, without benefit to the patient. When the curtains were removed the patients at once recovered their health.

Drain and Ventilate.

We refer to these subjects very often in this column, and fitly, because they are the corner stones in the preservation of health. The *Polytechnic Review* thus presents the subject: "Wherever the soil water, unpurified by contact with unclean organic matters, sinks into the earth, it leaves behind it a moist and unwholesome residuum, and the warmer the air, the water and the soil, the more energetic are its unwholesome influences. Whether the infectious matters are transferred from the soil into the well waters, or whether they enter the air directly with their gaseous products of decomposition or by evaporation, are merely incidental accidents which do not at all affect the result, since, in every case, it is those who dwell upon or near such unwholesome soils who are the greatest sufferers. If the air of our dwelling houses is not frequently renewed by ventilation, or if water charged with organic impurities is permitted to saturate the soil about them, or if decomposing organic matter (or what is the same thing, filth) is stored up in the neighborhood, or so disposed of that it is permitted to impregnate and saturate the soil about and beneath the house, or if the channels by which these offensive matters are removed from the house, as in the sewerage systems of cities and towns, are not properly constructed or guarded, the air that enters a dwelling thus environed, will be charged with disease-breeding emanations arising from the soil or from the sewer pipes. The drinking water may become impregnated, and the unwholesome products thus introduced into the bodies of its inhabitants will, beyond all question, exert the most pernicious effects upon health, producing, according to the quantity of exposure and individual peculiarities, consequences more or less fatal."

CANDY AND TEETH.—*Hall's Journal* comes to the rescue of our candy-loving little ones, and says it is not true that sugar and candies are of themselves injurious to the teeth or the health of those who use them; so far from it, they are less injurious than any of the ordinary forms of food when employed in moderation. It would be a strange contradiction in the nature of things, if sugar and candy in moderation should be hurtful to the human body in any way, for sugar is a constituent of every article of food we can name. There is not a vegetable out of which it cannot be made, not a ripe fruit in our orchards which does not yield it in large proportions, and it is the main constituent of that "milk" which is provided for the young of animals and men all over the world. But to use this information intelligently and profitably, it must be remembered that sugar is an artificial product, is a concentration, and that if used in much larger proportions than would be found in our ordinary food, as provided by the beneficent Father of us all, we will suffer injury. We should never forget that the immoderate use of anything is destructive to human health and life, if persevered in. The best general rules to be observed are two: First, use concentrated sweets at meal times only; secondly, use them occasionally and in moderation.

POISON IN ARTIFICIAL FLOWERS.—Danger from picric acid lurks not only in colored stockings. The material is used for coloring in the manufacture of artificial flowers, and a well-defined case of poisoning therefrom is reported from New York. Mary Dougherty, aged 13, who had been employed a few months in a flower manufactory, has just died. Her death is attributed to poison which is supposed to have been communicated to the girl's system by the material with which she worked. The case needs to be carefully investigated to the end, that the exact character and effects of picric acid may be made known. Men who dye the cloth, which Mary Dougherty and other girls have made into flowers, receive no harm from working bare handed in the liquid. It is alleged sickness among the workers in the colored goods is the exception. Some organizations must be more susceptible to the influences of picric than others, or Mary Dougherty's death must be traceable to other causes. It is to be hoped the case will be carefully examined.

REMARKABLE SURGERY.—Robert F. Hurlbut, private secretary of Governor Bishop, of Ohio, has just had his tongue amputated near the root. The chin was sawed in twain and the jaw spread apart in order to take out the diseased tongue. The work was done in a comparatively short space of time, and the patient was comfortable and conscious in less than an hour. Next day Mr. Hurlbut walked across the room, and wrote his wants upon paper. He is not permitted to attempt to speak, and, of course, could not do so if he desired. The physicians think he will be able to articulate audibly in the course of time. Thus far the difficulty has been to give nourishment, which has been done by injection. Glass tubes have been secured, and hereafter nourishment will be given by that means until the soreness in the month is somewhat subdued. Mr. Hurlbut had a cancer at the root of his tongue. A like operation for the same cause was recently performed at one of the hospitals in Albany, but the patient died a few days subsequently.

COUNTRY AIR.—"People may say what they like about country air being so good for them," said Mrs. Partington, "and how they get fat upon it; for my part I shall always think it's owing to the vittles. Air may do for canamiles and other reptiles that live on it, but I know that men must have something more substantial."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Hoe's Chisel-Tooth Saws; Miners' and Builders' Horse Power, 257. The Week; Our Minerals at the Paris Exposition; Varied Forms of Mining in California; Notices of Recent Patents; The Special Commissioner to Paris, 264. The Art of Mechanical Design; A Field for Miners, Mechanics and Metallurgists; San Francisco Art Association, 256.

ILLUSTRATIONS.—The Hoe Patent Chisel Tooth for Circular Saws; Improved Horse-Power for Hoisting Purposes, 257. Steam Engine Cylinder, 265.

CORRESPONDENCE.—The Bodie Mines.—No. 2; Mining in Yuba and Placer Counties; Dr. Lewis' Campaign Tour, 268.

MECHANICAL PROGRESS.—New Process of Steel Casting; Lathe Tools and Tool Post Slots; Sewing Machine Motor; Typographical Machines in New York; New System of Pile-Driving; Velocity for Circular Saws; An Iron Buggy; Boring Hardened Steel; Simple Form of Bunsen Burner; Machinery Running at Night; The Labor on a Ship, 259.

SCIENTIFIC PROGRESS.—Atmospheric Ocean; The Coming Transit of Mercury; Pulses by Telegraph; Relative Sensitiveness of Various Tests for Arsenic; Delicate Test for Vapors of Mercury; Cheese and the Microscope; Entomology at Paris; Combination of Nickel with Carbon and Silicon; New Cooling Agent; On Determination of Chlorine; Separation of Antimony and Arsenic, 259.

USEFUL INFORMATION.—To Prevent Honey-comb in Castings; Billions and Trillions; Uranus; Deposits of Nitrate of Soda; Pouring Lead; Britain's Importation of Food; Geraniums and Snakes; Ice; To Restore Mahogany Polish, 263.

GOOD HEALTH.—Wearing the Beard; How Poisons are Spread; Drain and Ventilate; Candy and Teeth; Poison in Artificial Flowers; Remarkable Surgery; Country Air, 263.

MISCELLANEOUS.—A Mistake; The California Quicksilver Mine; Arizona Bullion; Death in the Depths; The Use of Ornament in Construction; A Supplementary Contract for the Poughkeepsie Bridge; What Each Has Done, 258. The Medicinal Spring of California; Eureka Monthly Bullion; Deepest Vertical Shaft in the United States; Wood in Washoe; Death of a Gifted Man; A New Tax; More Economy Required in Mining; Pig Lead from Fumes; Progress of Arizona; Railways in Portugal, 262. Northwestern Arizona; Richness of Colliers; The Hackberry Mine; Terra Cotta and Fire Brick; The Paradise Valley Mines; The Old Ruby Mountain Mines, 263.

MINING SUMMARY from the various counties of California, Nevada and Arizona, 260-267.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends, 260.

NEWS IN BRIEF on page 268 and other pages.

NEW ADVERTISEMENTS.

Union Iron Works, Prescott, Scott & Co., S. F.; Howell's Improved White Roasting Furnace, Rankin, Brayton & Co., S. F.; Assessments—Excelsior S. M. Co.

The Week.

Slowly California is recovering from the industrial depression growing out of last year's bad harvest and other untoward events, and it will not be long till our material interests are restored to a normal condition, the country improved by the observance of more frugal habits, and the practice of greater industry, which the prevailing hard times have made necessary. With this partial revival of business and the return of good weather, there is more work for the unemployed, the number of whom, when the grain harvest sets in, will be still further reduced. Although we have had a large idle population for the past six or eight months, the army of tramps has not visibly increased, never having assumed here the dangerous proportions reached in most other countries. With this good prospect for getting work at home, no great number of our laboring men have this spring left the State, neither the Black Hills nor Arizona having drawn very heavily on this element of our population. The settlement of threatened complications with Mexico has had a good effect upon our trade with that country, which, already considerable, may be expected to grow still more rapidly, should the pacific relations now existing between the two countries continue undisturbed.

Our Minerals at the Paris Exposition.

Almarin B. Paul, Chairman of the Committee on Minerals for the Paris exposition, has presented a report on the proceedings taken by that body, of which the following embraces the leading points. This committee commenced their labors after having been requested to do so by the leading citizens, business and mining men of the coast, represented by a general committee, chosen to act for these parties. Mr. Paul and his coadjutors, depending upon these wealthy and influential parties for assistance and support, proceeded to make all preliminary arrangements for insuring a full and creditable representation of our mineral wealth and mining industries at the great exposition, as the world had a right to expect, hiring rooms, issuing circulars and adopting such other measures as were required, expending money and incurring pecuniary obligations on their individual account to the amount of some \$800. On applying to the general committee for money to liquidate this indebtedness, they were found to be without funds, these influential and wealthy people having failed when called upon for aid to respond in a manner corresponding with their implied promises.

Next an appeal was made to the Legislature, then in session, and a confident belief that they would make a sufficient appropriation to enable the Committee to go on with the work they had undertaken, but this body, pleading the necessity for practicing public economy, declined to extend to them any assistance in their emergency.

In this crisis, and while the committee were about to announce to the public the failure of their efforts, John W. Mackey came to the rescue, donating the sum of \$5,500 for carrying on the work, which was thereupon continued, the enterprising gentlemen having it in hand applying themselves to its prosecution with renewed energy and zeal. After a period of four months their home duties have been brought to an end, the final shipment of specimens for Paris having recently been made.

During this time the labors of the committee, especially of the two more active members, Messrs. Paul and Hanks, have been unintermitting and arduous. That they have been ably and faithfully discharged will be generally conceded. Among other duties that they have had to perform, has been the writing of a large number of letters addressed to particular parties throughout every section of the coast; the preparation of circulars and catalogues, the classifying, labeling, boxing and shipping of mineral specimens, some of them of great delicacy or value, all requiring to be done with system and care. Altogether 69 boxes of this material have been sent off, the collection consisting of ores and fossils, minerals from California, Nevada, Oregon, Utah and Arizona, 15 of the boxes being filled with ores from various mines on the Comstock range. In view of the small amount of money available for the purpose, the collection may be considered both large and varied, no important mineral on the coast failing of a representation in it. The catalogue contains 1,387 leading specimens, some of which number as many as 40 varieties. The classification, attended to by Mr. Hanks, is perfect itself, and there is good reason for believing that the manner in which they will be displayed will be equally faultless, this gentleman having had much experience in the arranging of mineral cabinets. For the proper presentation of the smaller samples 50 cases covered with jeweler's glass, containing in all 300 running feet, are to be provided, the larger specimens being placed on stands.

After having served the end proposed, these specimens, unless reclaimed by the donors, will, on their return to this city, be here used to form the nucleus of a free museum of economic geology.

The Committee desire, through the press, to return thanks to Wells, Fargo & Co. and to the Central Pacific Railroad Company for facilities afforded in the transportation of articles; also to Edward Bosqui and W. T. Coleman for favors rendered both here and in New York; to Mr. Mackey the entire coast can only join in one hearty and simultaneous expression of thanks for his liberal and timely donation. That the members of this Committee should feel a little hurt at the manner in which they were left in lurch, after having been encouraged to go on with this business, is only natural. But it must be considered that the times are hard, compelling our citizens to many sacrifices in the interests of charity and the public good. The compulsory burdens of this community have been too heavy of late for them to assume voluntary ones with the same freedom as formerly. Again, it is not to be denied there are those who think the resources of California have been sufficiently advertised, if, indeed, we have not overdone that business, and do not therefore feel like contributing to bring them into further notice abroad. Hence this unexpected apathy in a cause that was thought to appeal so strongly to our local pride, that our leading citizens would emulate each other in extending to it a hearty support.

We are promised regular Eastern correspondence on practical subjects by Dr. Robert Grimshaw, well-known through his connection with the Franklin Institute, and his editorial management of an excellent cotemporary, the *Polytechnic Review*.

Varied Forms of Mining in California.

In some parts of the California gold fields the mines seem to expand under working. When one form of deposit has been worked out another presents itself. It is not easy to tell when the auriferous stock in certain localities is wholly exhausted. After the surface diggings have been depleted, lower strata of pay gravel are struck, situated sometimes under what was at first mistaken for the bedrock, or deep lying channels are opened up in places where none was looked for, or where there was little on top to indicate their presence. Abandoned districts that had yielded rich crops of gold dust to the first harvesters, on being gone over again, have blessed the gleaners more than they did the reapers. When the river bars and the beds of the gulches had been washed out the early miner considered his work final. But his successors found that the gravel run through his sluices would bear working over, and in some cases more than once. Then the river beds were laid bare and rifled of their contents. The subterranean channels were invaded, opening along their courses a new world to mining enterprise. The auriferous gravel banks were attacked, enlarging still further the domain of this industry; and now the modern river beds, that could not well be laid bare by wing-damming or fluming, are to be dredged or under-drifted and forced to contribute to the great want of the age, while the contents of such portions of the ancient channels as cannot be drained are to be lifted from their cradles by the hydraulic elevator, and made to yield up the gold that had been hid away in their dark chambers ever since the Pliocene epoch.

In the auriferous tailings that have made lodgment along certain of our mountain streams another new and attractive field for mining operations presents itself, the re-washing of this material, where practicable, being sure to prove exceedingly profitable. This branch of the business, while so very remunerative, is, so to speak, self-perpetuating, the hydraulic mines, primarily the chief source of supply, being likely to continue their contributions for a period reaching into the indefinite future.

While vein mining, keeping pace with placer operations, has made steady progress, it fills as yet only to an inappreciable extent the immeasurable field that opens for it here in California; and, although it does not take on such novel and varied forms as does the other branches of the business, it is still marked by certain noteworthy phases, being now after a quarter of a century most flourishing in the localities where it has been longest pursued, valuable quartz lodes being every day found in the most frequented as well as the most out-of-the-way places. Ore mining with us is only in its early dawn. What has been done amounts to hardly more than a series of experiments. When through these it shall have been a little more perfected it will stand almost first among our wealth-producing industries.

We allude to these various styles of mining, all of which are now being successfully practiced in California, to illustrate what a broad field is here opened for the pursuit of this business, nothing so diversified in the way of gold mining, being presented in any other country. Of the auriferous bluffs and heaches found along our northwestern seahoard we refrain from saying anything in this connection, inasmuch as the working of these have not as a general thing proved remunerative. In a few instances the washing of the gold containing sand found at these places has paid well, and many who have given the matter close attention are sanguine that the business will ultimately prove a great success. However this may turn out, certain it is these may justly be classed among the most remarkable of our many strange gold-bearing deposits, not a few of which hold out the most tempting inducements for the investment of capital while presenting at the same time inviting theaters for labor.

UNION IRON WORKS.—All readers who have need for iron work of almost any description, will be interested in the advertisement of the Union Iron Works, which appears in another column. This establishment is generally known as one of the most extensive and stalwart enterprises of our city, and the work which it has turned out, has served as a most important factor in our progress in mining and manufacturing. As may be seen by their advertisement, their range of work is wide. They give employment to a great number of men, and their establishment is worthy of patronage.

We are making arrangements to have our papers represented and pushed vigorously East of the Rocky mountains, by a journalist and engineer of ability and experience, who will devote himself to the acquisition of information of interest to our readers, and will also see that our advertisers' interests are advanced by a rapid enlargement of our Eastern circulation. Until further notice our New York address will be, P. O. box 1,947.

OUT ON THE DESERT.—A rich strike has been made on the 300 level of the Jones and Kinkead mine, at Pyramid. Assays from the new body run as high as \$218. The body of water is still so large at the bottom of the shaft that work has been temporarily suspended on the 400 level. —*Reno Journal*.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

GOVERNOR.—James Rigby, Carson, Nev. This invention relates to an improvement in steam engine governors and a novel method of employing the same, by which the speed of all classes of steam engines may be regulated, particularly those which are subjected to severe and sudden changes in the resistance to the power they supply. The invention consists in a novel construction for a main governor valve, and in combination with it of an operating engine, the valve of which is controlled and the admission of steam regulated by a revolving ball governor. This governor is mounted upon a spindle, having a pulley upon its outer end, which is driven by the frictional contact of another pulley; and this latter pulley is so mounted that the breakage of a belt allows it to immediately swing out of contact with the first pulley. A spring upon the governor spindle then acts to draw it back and with it the valve stem and valve, so as to shut off steam from the cylinder, and this allows the main steam valve to be closed so as to stop the engine or reduce its speed.

SOFA BED.—August Hansen, S. F. Mr. Hansen's improvements refer to that class of beds known as sofa beds. The invention consists in a novel construction of a hinged seat and back which unfold in opposite directions from the main portion of the sofa, so as to form a bed, having its length transversely to the direction of the seat. The back is peculiarly constructed, so that when folded up to form a sofa it maintains itself in position, and forms a strong brace. The arms, or end of the sofa, are fitted with reversible pieces to receive the upholstery, and these may be turned over, so as to prevent the upholstery from touching the floor when opened. One of the arms is provided with an extensible net to form a pillow at the side, if it be preferred to make up the bed in this manner instead of transversely.

WHEELS FOR VEHICLES.—Thos. H. King, S. F. This invention consists in a novel construction of the hub, with certain hearings, flanges and anti-frictional devices, whereby the inventor is enabled to reduce or entirely eliminate the tendency to break the axle, which results from the side strains upon the wheel. It also consists in a novel method of securing the spokes, so that a wooden spoke may be received in a perfectly solid manner within a metallic hub. A novel means is provided of completely closing and protecting the interior of the wheel against dirt.

CORNICE MOLD AND MITERING DEVICE.—G. K. Glenn and Henry Fern, Woodland, Yolo county. This relates to a novel construction of a cornice mold for the formation of plaster of Paris cornices in apartments, and so that the miter joints at the corners may be easily and rapidly formed at one operation, either externally or internally. By this method the joints are perfectly made at either side without further difficulty.

WATCH CASE SPRING.—P. F. Nelson, Santa Rosa. The invention relates to a novel construction of springs, which are intended to open the case of watches. It consists in the formation of the hinge and a hollow pin, so that a torsional spring may be introduced into the hinge, and serve to actuate the case without any outside connection.

The Special Commissioner to Paris.

Mr. Henry G. Hanks who has identified, classified and prepared the specimens of ores and minerals from this coast for the Paris exposition, left for Paris last Sunday. Mr. Hanks will, on his arrival there, arrange and take charge of the mineral exhibit, and will, without doubt, be able to make a very creditable display.

No better selection could have been made of a person to take charge of these minerals than Mr. Hanks. He has lived many years on this coast, is familiar with the various geological characteristics of different sections, and is thoroughly conversant with the state of our mining interests. He is, moreover, an enthusiastic mineralogist and collector, and a first-class chemist, having for many years followed the business of assayer and analyst. Mr. Hanks, in connection with Mr. Melville Atwood, was among the first on this coast to recognize the importance of the use of the microscope in the determination of mineral structure, and has followed that science closely for several years. He is probably the best judge of ores and minerals on this coast; that is, such is his familiarity with the subject that he seldom fails in judging at sight of the character of an ore or mineral of any description.

Such a man is eminently fit for the position assigned to him in this instance, and we have no doubt but that the whole coast will reap a material benefit from the appointment. People from all parts of the world will visit the exposition, and Mr. Hanks will be able to explain to them in an intelligent manner the peculiar characteristics, occurrence, etc., of all the specimens he has in charge.

The Art of Mechanical Design.

(Written for the Press—No. 1.)

Constructing a Steam Engine Cylinder.

The inventive genius of the American mechanic is proverbial. With every facility for practical observation and study, to see the operation of any mechanism, to work in the construction of machinery, it becomes a second nature to him, to endeavor by every means within his power, to simplify this arrangement, improve on that; resulting in the mechanical industries of the day constituting one continued progressive march.

While comparative seclusion must always command the best results in perfecting original modes of operation and combinations of mechanism, the practical mechanic in active daily occupation must always stand first in the ranks of those possessing the best chances of reaping a profitable and substantial return for the application of inventive genius, for the simple reason that his ideas are founded on realities, of practical use, and daily need, and his abilities are less likely to be led astray by impractical fancy, always regarding the demand for simplicity and general use.

While a natural gift of observation and comparison are common to all, so also is thought or originality of ideas; the first step being to record these ideas as they come, so as to make them available for further consideration by ourselves and others. Hence the desire, use, and necessity to reproduce, improve, and perfect them on paper by the art of mechanical design.

Though there are not wanting professors to teach this, having seldom worked through the shops themselves, in nine cases out of ten they weary and disappoint the machinist and pattern maker, by rules, theories, and abstruse propositions it may take months or years to master, and this from lack of acquaintance with the raw material, the vise, the lathe, wood, iron, hammer, chisel or file.

Leaving aside the professor's fee, let us calculate the expense of taking a lesson.

A drawing board and T square, a set square, four pins, two or three sheets of rough paper, a two-foot rule, pair of compasses and pencil, a complete and thoroughly efficient outfit for a sum too small to mention or within reach of all.

Perhaps the simplest object to start with in this first lesson is the cylinder of a steam engine. It forms the principal point of consideration in building an engine, the proportions of all the other working parts are designed from its proportions, and follow in due order and regularity, so much so that the cylinder is often referred to and spoken of as the whole engine. Having firmly fixed the paper on the board by a pin at each corner, place the square lengthwise across the paper, its edge level with the side of the board, about the center of the sheet, draw a line and write on the same center of engine.

Draw another line at right-angles to this at the center of the sheet, on this write center of stroke. Our work is now all set out and arranged, and on these two center lines we build and construct an engine any size to suit.

1st. The diameter, say one foot six inches, but first for convenience we will draw it on a scale of one inch to the foot, marking off three-fourths of an inch; on each side of the center of engine we draw two lines parallel to it, we have the top and bottom of the inside of the cylinder. By drawing two more lines, with a small space between, to represent the thickness of the metal, say five-eighths of an inch, we have the outside of the cylinder. Marking off one-twelfth inch each side of the center of stroke to represent the width of piston two inches, and again marking half that distance each side of the center of engine, we have the piston rod one inch in diameter.

One inch and a half each side of the center of stroke represents the stroke of the engine, three feet. To this we add the width of piston, to allow the same to work clear, and this gives us the ends of the cylinder. We then draw the projections at each end, which form flanges for bolting the ends of cylinder-covers to. Each end of the cylinder-harrel is turned slightly larger than the working part, to facilitate the working of the piston. The metal is also enlarged and strengthened at the ends and center by the small belts or projections shown. Inking these lines clearly in and coloring the sections of metal, ends our first lesson in mechanical design. Though in a similar manner in every essential detail we proceed to construct the front-cover stuffing-box, to allow the piston-rod to work through a steam-tight joint, also the valve ports, whose capacity is in direct proportion to the cylinder. Drawing these out a good size enables us to adjust the valves to a great nicety, and, starting from the piston-rod, we work out in a similar way and design the connecting-rod, crank-shaft and other working parts, each being designed in direct proportion to the piston-rod and the work it has to perform, and in this way an engine for any capacity and work is designed and gradually built up. The working parts once proportioned and fixed, the frame, bed and other stationary parts are drawn in to suit and form a comparative easy routine.

Time and patience in repeating the operations here mentioned and comparing them with

the accompanying sketch, which, if performed correctly will produce a *fac simile*, will soon enable the student to make intelligent working plans of any model or machine he may wish to perfect, and, if of sufficient application to pursue this work of designing a steam engine by himself, he can obtain the constants and formula representing the proportions of the different parts of an engine in a printed hand-book, and, if an ordinary good mathematician, can proceed in similar way to complete the construction of an engine of any desired form and capacity.

While confining this subject in the commencement to the comparatively established and well-proved routine of the design and construction of steam engines and machinery of daily use, the principles underlie the preparation of working drawings for patent purposes. Any mechanical apparatus, as well founded and efficient, and based on laws as well known and proved, is likely to be equally successful in proportion to its scope and use.

A simple thought, at which all exclaim "how easy!"—something you only wonder you did not think of 20 times before; coupled to ingenuity, mechanical skill and tact, has been the most prolific source of fortunate and successful invention, where there was perseverance sufficient to work out to successful operation and use. The laws of motion and those governing the relations of mechanism are as certain and undeviating as the laws of the planets, and the successful inventions of the future must be sought more in the adjustment and improvement of apparatus and operations in use than in any so-called discovery which may aim at suddenly superseding and surpassing those in continued use.

Remember, in constructing any mechanism, simplicity is next door to success; no mere mechanical arrangement ever did more than consume power; therefore, in every case, the fewer parts the better. Make sure of the operation you wish to perform before commencing to construct. If possible, draw it out to a good large size the first thing; this enables you to make

STEAM ENGINE CYLINDER.

improvements, and saves the waste of material incidental to experimenting in the same. Don't fancy every one is on the lookout to rob you of your ideas, but talk the matter over freely with any interested who you may have cause to trust, and thus avail yourself of other brains and judgment.

Lastly, there are men in connection with this establishment who for the last 20 years have been daily employed on the details of patent mechanical inventions, and who have, in the natural consequence of events, never had time, thought or desire to patent anything on their individual account. Therefore the opinion of an experienced, trustworthy and impartial expert, to be had at all times by calling at the PRESS office, cannot fail to commend itself to all who may be interested in any individual effort to turn to a profitable and remunerative account any inventive genius they possess, and take their place in the onward progressive march of our mechanical industries.

The second article will treat on the method of proportioning the different parts of any machine, showing how to obtain the proper thickness of metal, and the best and strongest form. J. HEBURN, Engineer.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Grand Prize, April 22d, \$21,000; McCracken Con., 23d, \$28,692.31; Northern Belle, 20th, \$3,295.53; Manhattan, 23d, \$15,100; Endowment, 23d, \$3,303.97; California, 20th, \$135,203.35; Northern Belle 17th, \$2,100.10; Hussey, 22d, \$5,500; Con. Virginia, 20th, \$121,924.41; Christy, 19th, \$5,007; Manhattan, 19th, \$16,669; Northern Belle, 15th, \$2,100.68; Standard, 16th, \$18,506.71; California, 17th, \$196,969.89; Con. Virginia, 17th, \$153,391.84; Justice, 18th, \$8,700.

WASHOE QUICKSILVER MINE.—Work is constantly going forward at the Nevada quicksilver mines, near Steamboat. A gentleman just in from these claims says a rich strike has been made at the upper claim. A tunnel has been carried into the claim 90 feet and at the header is 30 feet below the surface. At the face of the tunnel a large body of chloride and sulphide of mercury has just been discovered.—*Reno Gazette.*

A Field for Miners, Mechanics and Metallurgists.

We had recently the pleasure of an interesting conversation with a very intelligent gentleman from the United States of Colombia. He had had unusual opportunities for travel and observation in his own country and gave us what seemed a very sensible account of the resources and wants of this young Republic.

As is well known, this country lies at the northern part of South America, almost under the equator. The western part is traversed by three chains of the Andes, these are called the Cordillera of the coast (*Choco*), the Central (or *Quindin*), and the eastern Cordillera. Between the two latter lies the broad valley of the Magdalena river, which contains most of its principal cities. There are many of the mountains which rise above the snow line. The highest of them is the Tolima, latitude 4° 46' north, which rises 18,317 feet above the sea level. In the southeastern part of the country occur extensive plains or *llanos*.

The Climate

Of this country is usually considered bad by foreigners, because they rarely get into the interior. The lowlands of the coast are naturally moist, hot and unhealthy. This is particularly the case on the west coast (*choco*) and at Cartagena on the Caribbean sea, at which place the yellow fever is very prevalent. But the interior table lands or *templadas* being elevated enjoy a very mild and beautiful climate.

The Agricultural Products

Of the coast are cotton, rice, sugar-cane, tobacco, cocoa and tropical fruits. Higher up extensive forests prevail, among which are the wax-palm, and the *Chincona*, from which quinine is obtained.

Corn and wheat flourish on the elevated plains of the interior. Horses and cattle are

When mining and metallurgical machinery has to be transported over the Andes on the backs of mules it must needs be of the very simplest character.

From what has preceded it will be evident that

The Great Need of the Country

Is to have men who understand the mining and metallurgy of iron. If this metal was reduced, and a good foundry and machine shop established in such a central location as Bogota, the most serious difficulty would be removed. This is, however, the first and most necessary step, for the successful beneficiation of all the other metals depends upon the abundance of iron which can be obtained. Our Columbian friend stated that such a venture would in his opinion meet with great success, and that a few iron men was what was most needed at present.

In view of this many mining bubbles which have exploded upon this coast, it will not be necessary to put in a word of caution. The risks are evidently great enough, and none but men who are free of other entanglements, and who understand the business should think of taking such a step.

In conclusion it might be well to remark that the population is about three millions, one-third of which is composed of Indians. The people of the coast are lazy and useless, but those of the interior are more active and intelligent. They are said to be particularly apt at receiving ideas, mechanical and mining, and soon make clever workmen. The Indians are lazy, but not dangerous. The government never interferes with foreigners. The capital city, Bogota, contains some 60,000 people covers about one-third the area of San Francisco, and is generally built of brick and stone, the houses seldom being higher than two stories for fear of earthquakes. This city has a theater and an occasional opera. It has a fine university, with a faculty of nearly a 100 professors, and over 2,000 students, and is remarkable as the place where the celebrated chemist Boussingault did the work which has rendered him famous.

San Francisco Art Association.

The San Francisco Art Association is an organization which is doing a public service both for the stimulus which it affords to our California artists to improve their work and in the elevation of the general taste of the people to the appreciation of true art ideas and embodiments. The President of the association is Irving M. Scott, Esq., one of our most public spirited citizens. The society gives receptions at their rooms at intervals, and invites art loving people to attend and witness the progress which has been made in different modes of art expression. Thus the worthy artist secures the public eye and demand for his work, and is encouraged to persevere. At the last reception, which was held last week, there was a large attendance and a fine collection of paintings before them. The rooms were handsomely decorated, fine music was rendered by a band of musicians, and the scene would have convinced the most sceptical that the graces of culture and refinement are indeed sought for and appreciated by dwellers in a city which is generally described as given over to hater ends and aims.

One feature of this year's reception is notable and new, and served better than ever before to exhibit Californian art progress, it was solely an exhibition of works by artists who live in California, or were at some period resident here. Some of these artists have had the advantage of a training abroad, but most of them have worked their way upward without schooling in foreign countries. The list of artists who were represented is formidable, being as follows in the order of the programme: Wm. Keith, B. Sears, S. W. Shaw, J. W. Rix, Virgil Williams, John L. Fitch, G. J. Denning, J. Harrington, E. Williams, E. Narjot, E. W. Perry, Norton Bush, Nellie Hopps, Mrs. M. R. More, Charles Prosch, S. M. Brookes, R. D. Yeland, F. Bouvy, Thomas Hill, T. Ross, Ida Bell, E. A. Strout, Susie Dugan, Captain C. Rockwell, A. Hoosack, Humphrey Moore, William Bradford, E. A. Rockwell, B. Irwin, George H. Burgess, R. J. Bush, C. D. Robinson, Mrs. Dunn, Gustav Brock, A. Hart, Paul Frezeny, C. A. Hamilton, C. D. Shed, M. Lotz, S. J. Guy, J. B. Vandesforde, Mrs. Fanny Osborn W. F. Jackson, and H. G. Johnstone.

We have no space for special comment on the work on each of these artists, but we can say of the exhibition as a whole, that it was highly creditable to the artists and to the State. We hope the Art Association will go on in its valuable work until our "modern Italy" shall rival its prototype not only in its sunny clime, but in its noble achievements with brush and pencil.

THE WEBFOOT MINE.—We have been shown some very fine specimens of ore from the Webfoot mine, Pioneer district, Arizona. This mine is having a tunnel run in on it and the ore is from the tunnel. The assays are from \$309.16 to \$479.60 per ton. Some of the ore has horn and ruby silver. The ledge is stated to be from eight to 30 feet wide. A mill is being put up on the Guanaxato mine, near by, and ore from the Webfoot is to be concentrated and the concentrates shipped here for reduction. This mill will be ready for work in a few weeks. Some of the ore shown us was very rich.

Mining & Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our now community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

No. 202 Sansome St., S. F.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

Every work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

The Mining & Scientific Press,

Is the leading mining journal in America, and it enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere is unrivalled. Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, postage prepaid, \$4 a year in advance. Sample copies, post paid, ten cents.

DEWEY & CO., Publishers, S. F.

From A Patentee.

HUNSAKER, TULARE CO., CAL., Jan. 15, 1878.

You will now receive my grateful, heartfelt thanks for the able manner in which you have conducted the interest entrusted to you by me. Your acknowledged ability, confirmed to me as it is by the successful presentation of my claim for a patent on a pump power, not only delights me, but suggests the propriety of my continued patronage and that of all my friends. With kind wishes for your future success, I subscribe myself, yours respectfully,

A. L. HUNSAKER

MESSRS. DEWEY & CO., Patent Solicitors, S. F.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter-writers should be careful to enclose a stamp and addressed envelopes if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measures.

Singles samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS OFFICE, by DEWEY & CO.

FOR SALE.—A Good Type-Writer. Price, \$50. For further information, address "COPYIST," this office.

FINE RANCH FOR SALE.

LOWEST PRICE, \$8,000.

The ranch is situated on the direct stage road between Mendocino City and Cloverdale, in Mendocino County. Forty miles from Cloverdale, 20 miles from Navarro Ridge and one mile from the Christine Postoffice.

It Consists of a Total of 2,000 Acres,

Of which 640 are secured by Government title and the balance by possessory title. It consists of

150 Acres of Rich Bottom Land,

Which is adapted to the raising of Wheat, Barley, Oats, Potatoes, Corn, Vegetables, etc., and will raise as large crops as any land in the county. There is 1,210 acres of Fine Rolling Land which is A No. 1 pasture land, and capable of keeping 1,000 head of Sheep, or 100 Dairy Cows. This whole ranch is well fenced with picket and post and rail fence, and has eight good buildings on it, consisting of a good substantial and comfortable

Dwelling House of Six Rooms,

Two Barns, one of them 100x40 feet, and the other 40x40 feet, a Granary, Woodshed, Chicken House, and a No. 1 Dairy House, new last year. There is a bounteous and never failing supply of good soft water at both the Dwelling and Dairy Houses.

On the ranch is a large quantity of Redwood timber, suitable for all purposes. There is a

Fine Orchard of Some 300 Trees,

Of the choicest varieties of Peach, Apple, Pear and Plum, as well as a large quantity of Grapevines, Currant and Gooseberry bushes, and other small fruit. There is 100 acres sown to Wheat and Barley, which is now up four or five inches, and promises an abundant harvest in the fall.

The owner has also about 40 head of Cattle, a few Sheep, five horses, 150 head of hogs, 100 Hens, and a large supply of all necessary Farming Utensils, which he will dispose of to the purchaser at very reasonable terms if desired.

The neighborhood is as good as could be desired, only one mile from a store and one-half mile to a good schoolhouse, as well as one-half mile from a church.

The owner's reasons for selling are his wife's health and his dislike of the business. At the price at which it is offered it is the cheapest ranch in Mendocino County, as the crop bids fair to be worth when harvested, \$4,000.

Terms are \$8,000, one-half cash and the balance secured by a mortgage at one per cent. For full information, address

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notices of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 28th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome Street, San Francisco.

OAKLAND, CAL.

GOOD LAND

— IN A —

FAVORABLE LOCATION,

GUARANTEEING

Sure Crops Every Year.

The Reading Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends some 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is very healthful and comparatively desirable. The near proximity of high mountain peaks give cool nights during the "heated terms" which occur in our California summers.

Soft well water—remarkably sweet, pure and healthy—is obtainable at a depth of from 15 to 35 feet.

Wood is plentiful and easy to get.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch. Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

STEAM ENGINES AND BOILERS.

One new Straw-burning Portable Engine, made by
 Ransome, Sims & Head, Ipswich, England. This is a
 very superior engine, sent here as a sample engine for ex-
 hibition; one second-hand Straw-burning Engine, 8x10
 inch cylinder, (Rice); one second-hand Wood-burning En-
 gine, 8x12 inch cylinder, (Hoadley); one second-hand
 Wood-burning Engine, 7x10 inch cylinder, (Hoadley);
 one second-hand Wood-burning Engine, 6x10 inch cylin-
 der, (Hoadley); one second-hand Wood-burning Engine,
 6x12 inch cylinder, side engine; one new Stationary En-
 gine, independent cut-off, 12x24 inch cylinder. (The
 Straw-burning Engines named are free from infring-
 ements.)

One large sized Rock Breaker, Varney & Rix, size
 9x15; one Wood Splitting Machine; one 36-inch cylinder
 Russel Separator, (with extra cylinder,) and Lauffenberg
 shoe—very cheap, on account of owner's death; (will be
 sold with or without any of above engines.) All of the
 above second-hand engines have been in shop and over-
 hauled, and are in good working order. Various other
 machinery for sale. Purchase made on Commission.
 Machinery repairs solicited. Specialty of Portable En-
 gines and Boilers for threshing.

J. W. RILEY, (Box 2361) San Francisco.

THE O'HARRA
CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 83 per
 cent. to 95 per cent. of the silver, and put gold in a state
 so that 83 to 95 per cent. of the battery assay can be ob-
 tained by amalgamation on any gold or silver ore ever
 formed by nature.

The cost of Roasting and Chloridizing is as follows:
 One man, per day.....\$ 3 50
 One man, per day.....3 00
 Wood, 14 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
 Cost of one ton.....67¢
 From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the
 cost is decreased by 20 per cent.

Several furnaces are in successful operation in Califor-
 nia, Nevada and Idaho.

Any persons wishing any reference can address:
 JUDGE W. A. WEBSTER, Paymaster Mine, Reno, Nev.
 LEWIS CHALMERS, Manager Exchequer and IXL Mines,
 Silver Mountain, Cal.

 Redding, Shasta County, Cal.

For further information, apply to

D. J. O'HARRA, Reno, Nevada.

FIRE! FIRE!! FIRE!!!

ENGINE FOR SALE.

A first-class, large sized Britton Fire Engine, in fair
 order is offered for sale cheap. Price, \$400. It is worth
 more than double that sum. About forty men can work
 on the brakes. Towns or corporations wishing a good
 machine should examine this engine before ordering
 elsewhere. Apply to

ROOT, NELSON & CO.,
 Union Foundry, Sacramento

PAUL'S PULVERIZING BARREL.

For reduction of Quartz to a powder DRY. This Bar-
 rel is practical, durable and perfect in its operation
 Manufactured and for sale

ALMARIN B. PAUL,

Room 20, Safe Deposit Building, S. F.

Smelter and Refiner.

A competent person is desirous of receiving the position
 of Superintendent of a Smelting and Refining Works.
 Can give satisfactory reference for ability to smelt all lead
 ores, refine silver and make market lead. No objections
 to go to the Territories. Address P. F. M., this office.

 postpaid. **OEO. I. REED & CO., Nassau, N. Y.**

R. HOE & CO.'S
CHISEL TOOTH MILL EDGER,

And Shop Circular Saws with

Recent Improvements,

Made especially to meet the re-
 quirements of the heavy work of
 this Coast, are now giving perfect
 satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them
 that they cannot too soon avail themselves of the advan-
 tages of a saw that is in perfect condition to run
 when they receive it, and always remains
 sharp, exactly round, and precisely the same
 to a hair in every respect, without any of
 the expensive skilled labor which other saws
 constantly demand. Both Filers and Files
 are dispensed with.

The teeth being always the same length, and the cut-
 ting angle always the same, they never dodge, but go
 through the knots in a surprising manner.

They never have to be taken off the man-
 drel, and will stand up square in edging and stock,
 which makes them indispensable for gangs.

The advantages being too numerous to mention in an
 advertisement, parties will please send for circulars and
 say they saw this in *Mining and Scientific Press*.

H. L. TATUM & Co., Sole Agents,

No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND
 AND CUTS, the only reliable method of lubricating ma-
 chinery, doing it almost without attention, absolutely
 without drip or stop, and at a merely nominal expense,
 and for the WORLD STANDARD CYLINDER OIL, OF SAME
 MAKE.

 (Mention *Mining and Scientific Press*.)

Continued from page 261.

The ores will run from 16% to 60% of lead, and from \$40 to \$60 in gold and silver per ton. The gauge consists of the oxides of iron, manganese, etc., similar to that of the Eureka Con. and Richmond mines. From the superficial workings there have been raised by a hand windlass and horse whims, ores which have yielded over \$200,000 in gold, silver and lead.

RICHMOND CON. is looking better than ever, yielding something like \$90,000 from about 1,100 tons of ore. The coke experiment at the Richmond furnaces is a pronounced success. The company control a coal mine on the Union Pacific railroad, from which they expect to draw their supplies.

BULLION shipments from the district have been much larger for the first half of April than they were during the same period in March.

DANVILLE DISTRICT.

ANOTHER.—Eureka Sentinel, April 19: Work in this old district has been resumed on a few of the claims, some of which have yielded largely in the past. Being situated at an elevation of 7,500 feet, the snow falls to a great depth here, preventing working in the winter.

PARADISE DISTRICT.

THE MINES.—Silver State, April 19: The mineral discoveries made here promise to be of the first importance, and are daily being added to. Some of the ores here are as rich as any ever found in the State. The Silver Prize is looking especially well, some of the ore being covered with native silver.

RYE PATCH.—Everything looking and running here as usual. The mill is working 12 tons of ore daily. The pulp assays \$64; the tailings \$10. The capacity of the mill will shortly be increased, there being thousands of tons of ore in sight in the mine.

REESE RIVER DISTRICT.

MANHATTAN.—Reville, April 13: During this week the mill has reduced 130 tons, 1,932 pounds of ore, and shipped hullion of the value of \$32,816.07.

FROST SHAFT.—The stopes in the 670 level are producing a larger quantity and better quality of ore than heretofore. The 670 drift continues in good ore and the stope is being extended east as the drift advances. The 770 west drift carries good ore in places, indicating a near approach to the chimney.

CURTIS SHAFT.—The 600 stope is producing the usual amount of ore from the south ledge, the top of the north ledge yet remaining intact.

Arizona.

ORE AND BULLION.—Citizen, April 12: Thirteen thousand six hundred and forty-two pounds of silver ore from the McMillen mine was unloaded at Jos. Collingwood's corral last Saturday. The value of this shipment is estimated at about \$80,000. It is the result of only two days' work in the mine. One piece of this ore sewed up in a rawhide weighs 658 pounds. About \$4,600 in silver hullion from the Miami mill came in on Tuesday.

THE TIPTOP.—Miner, April 12: The 10-stamp mill of this company gives entire satisfaction. It is driven by a 76-horse power engine, one of Whites furnaces is used to roast the ores, which are worked up to 94% of the battery assay. The hullion produced during March, with a great deal on account of incomplete belting, etc., aggregated \$47,309.69. The average of all ore worked at this mill since it started has been \$185.60 per ton. The only ore worked as custom has been about 20 tons, however, the company have purchased considerable ore from outside mines as an accommodation to miners and prospectors throughout Humboldt district. There is sufficient ore on the dump at the mill to keep it running for 30 days, which is not likely to diminish, as the amount arriving daily is in excess of that being worked.

MINING MATTERS.—Enterprise, April 10: Word from the Peck mine is to the effect that everything is progressing favorably at mill and mine. Preparations are being made to run the Aztlan mill. The Crook mill is steadily at work. The work of developing the Tiger mine is progressing. The owners of the Perry mine, in Hassayampa district, have about eight tons of very rich ore sacked, ready to be shipped to San Francisco. The mine is one of the best in the Territory. It is well prospected by shafts and tunnels. The ore is worth from \$200 to \$1,200 per ton. That which yields the latter sum is a chloride.

HUMBOLDT DISTRICT.—Louis Jantzen has struck it rich in the Butcher Boy and Rip Van Winkle, the former showing fine specimens of horn silver and lots of free gold. This Butcher Boy is rich in silver. McPhee & Dement are taking out ore that they intend to ship to San Francisco, to see if it will not beat recent returns from the same ore worked at the Tiptop mill. Bigelow & Opdyke are sinking on the Isabella. The bottom of the 75-foot shaft shows a vein three feet wide. On the Basin mine they are working night and day to connect the drift with the main shaft. The Greenhorn mine has been leased by Austin & Co., from Parks & Gelespie, who are taking out rich ore at a depth of 50 feet. Judge Walsh is taking rich ore from the Dividend and Empire mines. Godfrey & Dougherty have a lot of ore sacked and ready for shipment from the Yosemite mine. The Tiptop mine is looking better than at any time in the past. The company have a force of men on the Foymine. William Bell has struck it "way up" in the Big Bell. McCannan & Gelespie are drifting on the Jenny Green.

News in Brief.

RENO is again infested by tramps.
The Paris Exposition will open May 1st.
THERE were 86 deaths in the city last week.
The river Danube is now open its entire course.

THE new cannery factory of Rio Vista is nearly completed.

A COMPANY is being formed to light Paris by electricity.

DR. CARVER, the great shootist, is now starting at Denver.

PETER COOPER is said to be a millionaire of 20-horse power.

It is estimated that Stanislaus county will produce 6,000,000 bushels of grain this year.

SEATTLE shipped to San Francisco 8,925 tons of coal during the month of March.

THERE is in the vaults of the State Treasury of California \$1,847,406.46.

THE *Open Letter*, the Workingmen's organ, has been changed from a daily to a weekly.

ALEXANDER H. STEPHENS says he will on no condition be a candidate for the Presidency.

THEY had a severe shock of earthquake in Constantinople about a week ago.

COUNT JOANNES has cleared \$10,000 this season by his Shaksperian riots.

ALFALFA hay is selling in Phoenix, Arizona, for \$12 per ton.

ABOUT two and a half million silver dollars have been coined to date.

DURING a recent gale along the northern coast of Spain, 150 fishermen were drowned.

THE authorities of Seattle are trying to rid that city of opium dens.

GOVERNOR CASTAJO is making determined efforts to rid Lower California of bad characters.

ISAAC ROGERS, a Union Pacific brakeman, was fatally crushed at Omaha, while coupling cars.

OVER 11,000 passengers were carried over the California Street railroad on the opening day.

In San Francisco the rainfall amounts to 35.11 inches for the season, against 10.85 for 1877 and 30.72 for 1876.

THE House has passed the bill appropriating \$5,000 for a monument over the grave of Thomas Jefferson.

BOSTON pays about \$640,000 yearly in assisting poor families—an average of about \$35 to each family assisted.

LICENSE-COLLECTOR SENTON issued 3,005 licenses in March, for which the city received \$30,910.

ELKO people have a dead thing on their county prisoners. They make them work improving the cemetery.

THE Mechanics' Institute will hold another Industrial exhibition this year, commencing August 6th.

ONLY the personal friends of Wm. M. Tweed attended his funeral, which took place from the residence of his daughter, Mrs. Douglass.

ARCHDUKE FRANCIS CHARLES of Austria left a fortune of \$12,000,000, one-third of which is to be applied to relieving the poor.

THE horse "Controller," on a \$1,000 wager, made 20 miles in 58 minutes and 57 seconds at the Bay District track on Saturday last, claimed to be the biggest feat on record.

CAPT. JAMES GOODWIN, an old citizen of Oregon, was murdered on the 18th inst. near his residence at the foot of the Cascade mountains, for his money.

A. G. Benson, who brought out a large number of early settlers to California, and who became the moving spirit in the Lohos island enterprise, died recently in the city of New York.

ON the 14th inst six inches of snow fell at Grass Valley and vicinity, the branches of the trees, however, were not broken down nor the young fruit injured as generally happens with these late snows.

THE Nationalists of Pennsylvania are to hold their State Convention in Philadelphia on Wednesday, May 8th.

A VIGOROUS fight is going on between Chicago and St. Louis roads for the Missouri river traffic.

A PARIS dispatch says: Greece has accepted the invitation of the United States to an international bi-metallic Conference.

TWO of those in custody for suspected complicity in the murder of the Earl of Leitrim have been discharged.

THE Coopers' strike in this city is at an end, the employers who held out having made the concessions demanded.

A FIRM in San Antonio, Texas, have been shipping arms to Mexico for some weeks past. A movement against Diaz is suspected.

THE New York Herald has several dispatches from the South and West, announcing banks and other establishments paying out gold at par.

THREE Louisianians are credited with killing 9,000 alligators last year. They saved the oil, and sold the hides for 75 cents apiece.

A BOSTON paper estimates that at least \$10,000 a day are sent to California from that city to be invested in mining stocks.

BLOSIOUS PRISTORIUS, an ex-priest, has been denied a new trial in Montgomery county, Pa., for the murder of Isaac Jaquette, and will be hanged.

THE resurvey of San Diego harbor has been completed, and shows 23½ feet at lowest water on the bar—a notable improvement since the survey of 1856.

A. D. REMINGTON, an old paper dealer of San Francisco, has purchased the Lick mill property, in Santa Clara county, and is fitting it up for the manufacture of manila and printing paper.

THOS. BATCHELDAIR, of Fulton, Oswego county, 80 years of age, has been uninterruptedly engaged in the printing business for 67 years, and claims to be the oldest printer in the United States.

THE Iron and Steel Association's *Bulletin* says that the total production of pig iron in the United States last year was 2,314,585 tons of 2,000 pounds, a gain of 221,349 tons over 1876.

THE jury in the case of Breen and Cowie, accused of being bribed to let a Chinese murderer escape at Virginia City, having failed to agree were discharged, nine being for acquittal.

TWO hundred horses per week are being purchased in the neighborhood of Troy, N. Y., and in the western portion of Vermont, by agents of the English Government.

A SERIOUS riot occurred lately near Glasgow. Some miners on a strike attacked the Sheriff's officers who were serving notice of ejectment. Several houses were wrecked and telegraph lines destroyed.

LARKIN G. MEAD has designed a monument to the late Oliver P. Morton—a shaft rising from a base and sub-base, and bearing at a height of 115 feet a statue of Morton, heroic size, in the attitude of speaking. Cost \$100,000.

THE schooner *Paloma*, in port from Tahiti, reports that on February 7th, a severe hurricane raged in the Pamotas, and that about 120 persons were killed and a great deal of property destroyed.

THEY have had a fearful fall of rain, accompanied with wind, thunder and lightning, at Deadwood, in the Black Hills. The town was flooded, the roads torn up and much damage done to property.

It is alleged that important documents are coming from Cuba, as a result of Judge Leonard's visit, showing that the kidnapping of Florida negroes and enslaving them in Cuba has been carried on extensively.

FRANK SPEARMAN, a native of Ireland, aged about 45 years, was crushed to death last Saturday evening by a dummy on the California Street railroad. He was a carpenter and leaves a wife and six children.

THE late Mark Hopkins left Great Barrington, Mass., 25 years ago in coarse clothes and rough hoots, and a little money given to him by his uncle. Last year his wife visited Great Barrington in a special palace car, with a large retinue of servants.

A THIRTY-mile race was run at Vallejo on the 20th inst by W. V. Smith and M. Stiltz. Six horses were used, and the riders changed animals every mile. Smith rode the distance in an hour and 25 minutes, but the race was awarded to Stiltz, Smith having sprained an ankle and being aided to mount during the contest.

ON the 21st inst, Colonel W. L. Salisbury, a banker, Mayor *pro tem* and owner of the *Enquirer-Sun* in Columbus, Ga., was fatally shot in the back while entering a train at Seale, Ala. by Dr. R. M. Palmer. The latter had sued Salisbury for \$250,000 damages to his character. The jury awarded him one cent. Palmer fled.

A STORM at Pomeroy in Iowa, on Sunday, blew down a number of houses, killed a son of George Wallace and a son of Mr. Pearce, and wounded twenty or thirty other persons. Trees were torn up, and the country presented the appearance of being ravaged by a terrible cyclone. A man named Reilly was carried over a house and over tree-tops, and set down uninjured. Cattle were hurled to long distances and killed. Hailstones fastened together in great masses. Alfred King's residence was lifted from the ground and dashed to a thousand pieces. His mother was instantly killed.

A buggy of his was carried a quarter of a mile through the air. The water in the lake rose to a prodigious height.

MODEL MARRER and MACHINIST.—I. A. Heald, No. 614 Commercial St., San Francisco, (fourth floor).

Thirteenth Industrial Exhibition of the Mechanics' Institute, S. F.

The Board of Managers have the honor to announce that the Thirteenth Exhibition of the Mechanics' Institute, and the fifth annual one given in the grand pavilion on Mission, Market and Eighth streets, will open to the public August 6th, and close September 7th, 1878.

THE public are respectfully requested to respond liberally as exhibitors and visitors, and thus enable the Board of Trustees to realize from this fair a sum sufficient to liquidate the small indebtedness now due on the Mechanics' Institute library property, and to answer a speedy fulfillment of the sanguine hope of the Trustees and well-wishers of the Society to make it a free library for mechanics and apprentices, the Board to institute permanent classes for instruction in the mechanic arts.

THE exhibition building is 550 feet long, 200 feet wide, centrally located, and accessible by six lines of street cars, giving direct communication with all parts of the city.

THE promenade is a gallery under the main nave, 16 feet wide and 1,000 feet long, from which an unobstructed view of the interior is obtained.

IN addition there is an annex 220 feet long by 75 feet wide, containing the exotic garden, which will contain all that is rare and beautiful in the floral and horticultural world, increased by the finest rustic and picturesque effects obtainable. The whole, pavilion and garden, will be brilliantly illuminated at night.

THE art gallery, 400 feet long by 50 wide, will be made specially attractive by paintings, statuary and works of art. The Managers are happy to announce that the San Francisco Art Association have kindly consented to take charge of the same, and that our local artists have promised to display their best productions.

AMONG the many attractions this year the musical part of the exhibition will be a noted feature, as the best obtainable orchestra will each afternoon and evening give a grand instrumental concert, introducing the latest and most pleasing novelties of musical composition.

A fine refreshment saloon, restaurant, and 4,500 comfortable seats will be provided for the convenience of visitors, of which the average attendance during the last exhibition was 12,500 per day.

THE Board of Managers particularly desire that the natural and manufactured products of this coast should be well represented, and to that end all possible facilities will be extended to exhibitors of such articles.

A large and powerful engine will furnish ample motive power, while steam and water will be furnished for such machines and appliances as require them, free of cost to the exhibitors. The main line of shafting is 490 feet long, with pulleys sufficient for all requirements.

IT is expected that the various transportation companies will convey goods intended for exhibition at one-half the usual rates.

THE matter of premiums has not yet been determined upon.

APPLICATIONS for space, rules and regulations, or any information regarding the exhibition, will be given or sent by addressing the Secretary.

Board of Managers:

Irving M. Scott, Henry L. Davis, Asa R. Wells, James Duffy, C. Waterhouse, George Spaulding, James Drury, H. S. Smith, James Spiers, D. A. McDonald, J. B. Stetson, H. L. Hutchinson, Nathaniel Hunter, A. L. Fish.
J. H. CULVER, Secretary, 27 Post st.

For the Paris Exposition.

The Committee on Minerals for the Paris Exposition announce that everything not in by the first of April will be left behind. It is likely that many mineral specimens intended for the great show will not reach here by that time, and as there are probably other things yet to be sent forward, it may be worth while to state that the American European Express, Baldwin Bros. & Co., Proprietors, 72 Broadway, New York, forward packages to the Paris Exposition at the following special rates: Four lbs., \$1.25; 8 lbs., \$1.50; 12 lbs., \$2.25; 20 lbs., \$3.25; 50 lbs., \$4.25; 75 lbs., \$5; 100 lbs., \$5.50, and for everything over three feet, 95 cents per foot. Custom expenses at Havre, 60 cents additional, per package. Freight in all cases to be prepaid.

MR. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE, Business of importance.

AYER & SON'S MANUAL contains information of much value to advertisers; sent free. Address N. W. Ayer & Son, Advertising Agents, Times' Building, Philadelphia.

ANY PHOTOGRAPHER having a large Camera Box for sale will please notify "N. S." at this office.

Iron and Machine Works.

THOS. PENDERGAST.

HENRY S. SMITH.

ÆTNA IRON WORKS,

MANUFACTURERS OF

IRON CASTINGS

and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom,

SAN FRANCISCO.

PHELPS

MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS. HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,
SAN FRANCISCO, CAL.

SACRAMENTO BOILER WORKS,

214 to 218 BEALE STREET,

HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Oirders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

UNION IRON WORKS, SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets,
SACRAMENTO, CAL.

American Machine

Experimental and Fine Special Machinery, Planing and Gear Cutting, Printing Press, Band Instrument and General Machine Repairing; Dies, Taps, Punches, Reamers and other Tools made to order. Models and Patterns for Inventors promptly executed in Wood or Metals. 514 Commercial Street, between Sansome and Leidesdorff, (Third Floor), San Francisco, Cal.

I. A. HEALD, Proprietor.

CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna.

SAN FRANCISCO, CAL.

All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.

J. H. WEED.

V. KINGWELL.

California Machine Works,

119 Beale St., San Francisco.

BIRCH, ARGALL & CO.,

UILDERS OF QUARTZ, SAW AND FLOUR MILLS,
STEAM AND HYDRAULIC ELEVATORS.

Sole manufacturers of Brodies Patent Rock Crushers and Steel Faced Tappets, and General Machinists.

HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDOE AND MACHINE BOLTS, LAG SCREWS, NUTS, WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

Orders Solicited and Promptly Executed.

Office, No. 16 FIRST STREET.

Fulton Iron Works.

Hinckley, Spiers & Hayes.

(ESTABLISHED IN 1855.)

Works, Fremont and Howard St. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating

Engines and Boilers

of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended and at very moderate rates.

Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing or Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

MANUFACTURED UNDER A. NOBELS' ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS,

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NEILSEN & CO., San Francisco.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

STEINWAY

PIANOS TO EUROPE.

STEINWAY & SONS Orders From Europe

Have increased to an extent, necessitating the establishment of Warerooms in London, England, and connected with it is a Concert Hall, the whole combined making the most elegant Piano Warerooms in Europe, and stands there as a monument of American genius and industry.

It is impossible to mention in the limited space of an advertisement the innumerable triumphs of this energetic firm. They stand foremost as inventors in Piano building in America, and in that respect, no small compliment to their inventions is the undeniable endorsement of all their competitors, as shown in their imitative efforts. Certain principles of the Steinways, are, however, so completely protected, that no imitation or substitute is attempted at all, and the shallow method of crying such inventions down are resorted to and relied upon.

The Steinways designed and perfected the Overstrung and Iron Frame systems. The application of the Agraffe Arrangements to Square and Upright Pianos. The Patent Duplex Scale, creating the most beautiful treble tones, (the Duplex Scale is of recent invention and only to be found in Pianos sold recently). The improved Double Dampers. The later idea extending the Agraffes to every string in the Piano. The highest finish to all parts of the instrument, including first quality of ivory, ebony, felt, cloth, etc. The wood and varnish of such first-class character, that the employment of large capital and experience alone permits.

The name of Steinway has become a "household word" in American homes, and the satisfactory record of 18 years' trial on the Pacific Coast, in itself assures the purchaser that the investment is no speculation, but one of perfect security.

The oft-repeated story of rival makers claiming to have been Steinways' foreman, etc.,

should have no weight with purchasers. An immense manufacturing business like the Steinway's is divided into departments for the various classes of work, and a foreman of one department superintends that alone, and cannot be perfected in other details.

The Steinways (a numerous family) are the inventors and designers of the principles of their pianos, and are alone responsible for the thorough execution of their own ideas.

In the Machinery Department at the late Centennial Exhibition, Steinways were awarded a special medal for an invention for testing their iron frames under a pressure of 5,000 pounds to the square centimeter. (This award was distinct from their medal for the best pianos exhibited.) The iron frames in Steinway pianos are the only ones so tested, and while other makers rely on castings from an ordinary foundry, the Steinways maintain their own foundry, and manufacture a frame of composite metal, which adds greatly to the resonant qualities of the instrument in general.

It often occurs that the attempt is made to raise the character of pianos constructed on less costly principles to the rank that the Steinway maintains, by naming a price, the same, or nearly so. This method is frequently exposed by the perfect willingness of the dealer to make astonishing discounts for cash, or extremely long credits; systems not entertained in any first-class business. In selling a Steinway piano, a guarantee of worth is given protecting the purchaser for five years, and catalogues issued by the Pacific Coast Agencies have an uniform rate of prices in gold, and where desired a liberal installment plan is offered to responsible buyers, with an additional charge of simple interest on deferred payments. Catalogue mailed on application to

G MAHE, Director

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidation and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento Valley. His advertisement appears from time to time in this paper.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, & 59 Gold St., Cor. Ann, N.Y.

The Future of the Quicksilver Interest.

Despite the present low prices, the production of quicksilver continues this year at about the same rate as last. Some of the mines not well conditioned for keeping up their former rate of production, have found it expedient to curtail the same, while many of the smaller ones have been forced to suspend operations altogether. Several of the larger and older companies have, however, turned out about their usual complement of metal, some of them barely earning enough to cover current expenses, while others have made some net profits.

The New Almaden company has been running largely on the tierras, and other classes of low grade ores that had accumulated on their dumps, or been passed by in former years, and through the use of their superior furnaces and other appliances, have been able to keep ahead of expenses. The Reddington, under an economical management, and with large low grade reserves near the surface, having managed to do the same. The Sulphur Banks, having a great deal of material that can be cheaply mined, have kept their furnaces employed, and as they claim, with some profit. The Great Western company also, according to their own statements, make quicksilver at a prime cost of 25 cents per lb., it is to be inferred that they have cleared some money by this year's operations, their reduction works having been run to their full capacity. As the Oceanic can produce for about 34 cents, they too must have earned something, though not running all their furnaces, the owners preferring to reserve their ore for better prices. The Altoona mine, in Trinity county, by reason of its high-grade ore, and its facility with which it can be mined, is able, no doubt, to produce quicksilver more cheaply than any other mine in California. From the geographical position of their mine, this company enjoys some peculiar advantages for marketing their metal, the gold miners in that remote section of the State mostly obtaining their supplies from them. The New Idria, Sutherland, Guadalupe and the mines of Sonoma, Lake and Napa, other than those mentioned, have been doing a somewhat restricted and moderate business, their earnings not much exceeded expenditures.

In the early part of the year, an effort was made by some of the more shrewd and largely interested proprietors, to effect such a combination as would tend to curtail production, keeping it within the consumptive demands of the country, and the requirements of the trade. This was a bit of good business policy, and in its application to industries of this kind, has sometimes been successfully carried out. The jealousies entertained by certain large companies sufficed, however, to defeat that concerted action, through which alone the end proposed could be reached; and it looks now as if the sharp competition existing in this industry, is destined to an indefinite continuance, restricting future profits to the present narrow margin. While this policy prevails, few new claims will be opened; deep developments will proceed slowly; the mines that have shut down will remain inactive, and others, perhaps, will be closed. Such only, as enjoy special advantages for production, will be able to go on, and when these propitious conditions shall cease, they too, will have to succumb to the inevitable. Only the favored few can long keep the field, these coming in and disappearing as conditions change. Left to itself, the doctrine of the survival of the fittest, must here eminently obtain.

BIG NUGGET.—The Jacksonville *Sentinel* of the 27th ult. says that on Saturday last, Martin Koster, of Foots creek, found a nugget in his claim, weighing three and a half pounds, worth about \$700. The day previous he found a piece worth over \$42, the which awakened in the mind of ye ancient miner memories of the past.

CHEAP RAILS.—An English firm has contracted to furnish 9,000 tons of steel rails for the Roman railway company, to be delivered at Leghorn at £6 10s. (about \$32.50) per ton. There is certainly no temptation for American manufacturers to compete with these terms.

Portable Valve Seat Planer.

This portable valve seat rotary planing machine, represented in the accompanying engraving, though of comparatively recent invention, has proved to be very useful in the locomotive repair shops, to engine builders and users in general. It is especially adapted to facing off the old valve seats of locomotives and other engines in a manner at once expeditious and correct. Its construction and the method of its attachment and operation are easily understood after an examination of the cut. There are two horizontal disks, the upper secured by radial arms, adjusted to suit the position of the

PORTABLE VALVE SEAT ROTARY PLANING MACHINE.

studs in the valve seat; the lower, carrying the cutter and its slide, revolves freely against the upper and is held in place by a king-bolt passing through its center. This lower plate is also secured by a circular gib upon its circumference, which admits of taking up the wear. It is an annular gear, having teeth cut on its inner periphery, from which it receives its rotary motion by means of its connection with the bevel gears and crank. The crank may be replaced by a pulley if power be convenient. The double bevel shaft acts like a back gear and admits of a change of speed. Either bevel is thrown into gear, at pleasure, by the movement of a pin in a slot operated by the hand-wheel. If the outer bevel is in action, it gears directly into the lower plate; if the inner bevel,

The points claimed for this tool are the great saving in time and labor over old methods; also a saving in files, and the fact that the job may be done accurately, as the plates may be set true with the unworn parts of the valve seat, and, consequently, the new face will be likewise true. It is readily seen that the work done is exactly in line with the travel of the valve stem, thereby preventing the yoke from slipping up and down the valve, as well as all extra friction on the valve stem. No more material need be removed than is absolutely necessary to true up, thus saving the seat. The work is done by a continuous cut, and the loss of time from the return motion of the ordinary planer avoided. There is also no breaking out of the edges. The saving claimed by the makers over old methods is from 75% to 80%, and 100% in

files, as none need be used. After the seat is planed the machine can be lifted off and placed on a table, which is supplied with stationary adjusting columns and chuck for holding the valve, then the valve is planed. In many instances, when the work is done in round houses, the table is essential to a more perfect and satisfactory job. It is estimated that an ordinary locomotive valve seat can be thoroughly trued up in two hours. For further information on this subject, address L. B. Flanders, manufacturer, 1025 Hamilton street, Philadelphia.

DR. LEWIS' CAMPING PARTY.—The starting of Dr. Lewis' camping party was celebrated near Melrose on Wednesday by an opening din-

IMPROVED CRANK PIN MACHINE.

ner in camp. Sixty or more tourists, who have placed themselves under Dr. Lewis' guidance, and quite a company of united guests made up a very enjoyable dinner party, and the campers started out under bright skies for their four and a half months of fresh air and exercise, sunshine and beautiful scenery. Dr. Lewis has inaugurated this new departure in camp life, in an earnest desire to bring before the public the advantages of out-door life in the mountains; and he feels convinced that the camping party's experiences of this year will enable him next year to bring 500 people from the East to enjoy a season of camp life in our mountains. The idea is a good one.

The shooting match between Carver, of California and Petty, of Omaha, resulted in favor of Carver, who broke 487 glass balls out of 500, using a rifle, while Petty broke 478 out of 500, using a shotgun.

An Old Miner and a New Process.

From Mr. R. F. L. Halleck, of Placerville, El Dorado county, we have received a letter recounting some of his experiences as a metallurgist and millman during a residence of 25 years in California. In 1853 our correspondent was working quartz in Butte county by the rude and primitive plans then in use, coarse baize and rawhides being employed to catch the gold. The mill cams, shafts and stamp stems were then made of wood; soda and potash being added to assist the mercury. About this time copper plates began to make their appearance, many other inventions of less obvious utility having soon after been introduced. Among these were diverse styles of pans, concentrators, separators, etc. Along from '55 to '58, more care and system began to be observed and better results were obtained, calcining and chloridizing being at this period resorted to. But the millmen being still without any process that would answer for working their low grade ores, this gentleman, with a view to supplying this want, got up what was known as the Halleck and Eiler process, for which he was estopped from getting a patent by parties who had anticipated his plan in some minor particulars. More recently he has devised another system for the reduction of rebellious ores, called the "Eureka process," and which, in some trials made upon Meadow lake rock, having given satisfaction, may be supposed to possess a good deal of merit. Encouraged by these experiments, works will be put up in that district the coming summer for operating on an extended scale. Should his success be commensurate with his expectations, the invention of the Eureka process will advance his professional reputation and reap a great pecuniary reward. We shall await with some interest the results of these more crucial trials of the new plan in a mining region where all other processes have heretofore so signally failed.

Improved Crank Pin Machine.

We give an engraving herewith representing a patent crank pin machine, built by L. B. Flanders, 1025 Hamilton street, Philadelphia, adapted to turning crank pins in position on a locomotive and while the wheels are under the engine. It is fastened by means of scroll and self-centering jaws at one end, to the collar of the pin, upon which there is no wear; it is then clamped in position by bolts passing through the spokes of driver. The tail stock center is then run up, and if the pin is not bent it will exactly fit in the old center holding the outer end true; if it does not come exactly central, the tool is pushed down and turned around the outer collar, showing exactly all the variation; the old center is then chipped till it does fit. The cut shows the cutter-bar and its gear driven and fed either way by the crank intermediate gearing, which gives motion to the screw. The cutter is bent and fastened by a set-screw in the extreme end of the cutter-bar, and is readily applied to the work, and fed by a nut moved by the screw as before mentioned. The boring attachment for truing up holes after being worn by a loose pin, is very quickly attached and adjusted to cut any size required.

METEOROLOGICAL SUMMARY FOR APRIL.—The report of the U. S. Signal Service officer, of San Francisco, for the month of April is summarized as follows: The mean height of barometer for the month was 29.93; mean temperature, 55.3; mean humidity, 70.4; prevailing winds, west; highest barometer, 30.215; lowest, 29.589; highest temperature, 70°; lowest, 44°; monthly range, 26; greatest velocity of wind, 28 miles per hour; total number of miles traveled by wind, 6,113; total rainfall, 1.06 inches. Rainfall in April during former years: 1872, .75 inches; 1873, .43 inches; 1874, .90 inches; 1875, .10 inches; 1876, 1.29 inches; 1877, .26 inches.

The late party of divers, under Capt. Winant, returned from the wreck of the *San Francisco* with \$16,000 in bullion, and five tons of valuable ores.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Bodie Mines.—No. 2.

[By the MINING AND SCIENTIFIC PRESS Correspondent.]

Some Details Concerning the General District Formation, Structure of the Veins, Character of Exploration, etc.

In the preceding edition of the PRESS, leading outlines of the history of Bodie district—its first excitement, decline and neglect, and final revival, and the occasion thereof—were given. In this article I will endeavor to convey some knowledge of the topographical and geological features of the district, and a substantial "glimpse" of the programme of exploration well advanced, with such conclusions as the prospects plainly warrant.

Possibly a word geographical may be in place. Bodie district is in Mono county, Cal., about eight miles from Aurora, Nev., in a direct line, the State line being located about midway between the two towns, whose history has been curiously linked together first and last. The traveled route to Bodie from San Francisco, is a roundabout one, but the journey is easily made in about 36 hours, by rail to Carson, thence by comfortable stage coaches, at a fare of \$36. Should the mines keep up their present interest indefinitely, the old road via the Sonora pass, from the end of the Copperopolis railroad at Milton, and being very direct to Bridgeport, Bodie and Aurora, will doubtless be repaired, and a strong line of travel and business created. In the meantime, however, the larger transportation interests involved—the Central Pacific, and Virginia and Truckee railroads—will undoubtedly extend an iron way south along the easterly base of the Sierras, which would always exert a controlling influence over all the trade and travel of the large and growing sections of Nevada and California in that direction.

The road from Aurora to Bodie, 12 miles in length, passes through a deep lava flow, in a natural gorge of wonderful interest to the beholder. The road rises in grade, until an altitude of 9,300 feet is reached at the town of Bodie, which is situated to the west of the bluff of this name, which region has an altitude of 10,000 feet, though it does not seem so high, owing to the generally high rolling country all about. Bodie bluff, however, stands out clearly defined, like an island, and the view from its crest is one of surpassing grandeur and extent, an amphitheater of snow-capped mountains, unequalled by anything in Switzerland. Down south a dozen miles at the base of the hills, is Mono lake, the so-called Dead sea of America, which adds to the scene. The climate at Bodie is variegated, there being considerable severe cold, stormy weather, as well as much that is excellent. It is healthful as well. The country is generally barren of timber in the better sense, only a good quality being attainable nearer the main Sierra belt, 20 or more miles distant. A goodly supply of fuel will be had several years yet within a few miles of Bodie. The water supply is dependent upon springs in the town and at different places adjacent to the mines, which, as yet, are comparatively dry. The town is built of lumber, and contains about 1,500 people, increasing in numbers.

Bodie district proper—the section embracing the mines—in about one by three miles in extent, the direction lengthwise being north and south. Bodie bluff terminates abruptly at the north end, Queen Bee hill is the southern, and Silver hill the intermediate eminences of interest. Going south from the high bluff, the district flattens down materially, and in the center of it is a whitish sedimentary formation, half a mile in length, sort of egg-shaped, which tends to the theory that the whole formation was at one time riven apart and afterwards filled in with this matter. Otherwise the district entire is one of the best defined, easiest understood, as to geological formation, in the history of mining. It is porphyritic and regular, the veins chiefly gold-bearing, and placed in a singularly interesting manner for the purposes of either theorizing or practical and successful exploration. As a rule, considerable debris is found over the surface of the district, creating a great number of "blind leads," but which can be readily discovered by crosscutting at no great depth. In the deeper levels these are found to carry down their original size as a rule, and all continuing to incline to a common center from either side and for the entire length of the district. It perhaps remains to be proven whether the theory is sound which concludes that there is one great mother lode at some point underneath all—the trunk of a tree, so to speak, of which the present system of ledges are only the branches. [It was the intention to illustrate this theory with a diagram, but owing to its being unfinished it will be reserved along with some sketches and maps, which are in course of preparation, for a small publication in book form at an early day.] The general width of the quartz veins is from two to three feet, but some of them are five and six, with fissures and ore chambers varying in size, from three to fifteen feet, as in the great Standard mine, which is a perfect formation as to casing and uniform quality of ore to a depth of over

800 feet and corresponding length. The weight of operations is confined to Bodie bluff as yet, on the extreme north end of which was centered the early explorations on any scale worthy of mention. There is a series of valuable veins—a score in number—almost jutting out of the abrupt north end of the bluff, all being more or less prospected by means of tunnels, shafts and crosscuts, but until the new regime operations were of a comparatively trifling and timid order, while the knowledge displayed in the reduction of these simply constructed ores was of the most imperfect kind, resulting more or less disastrously. The gold is of an exceedingly fine formation—will float in water—and the conclusion is irresistible, as compared with modern workings, that at least one-half was sluiced down stream directly from the batteries. The only thing successfully amalgamated being the magnetic iron involved. The vein matter on Bodie bluff has been hard near the surface, but at a depth of 50 or 100 feet it uniformly becomes soft, decomposed and easily mined without the use of powder, except as to the country rock. In the vicinity of Silver Hill, as at the Red Cloud, the ore carries more silver, turning to gold again at the base of Queen Bee hill, where the large and promising deposit, known as the Richer, is located. Except at the Red Cloud (250 feet) no depth of shaft has been attained outside of the main bluff, where the most systematic plan of operations is well under way, at a dozen important points. At the extreme north end, the Syndicate company are driving a main tunnel midway of the series, at a depth of 700 feet below the surface; it is in over 900 feet, and in a few months more will be in the midst of all. South of this and quite central as to location, the Standard company are sinking a shaft, exclusive of the mine proper, which will be carried to the greater depth of at least 1,500 feet, and is now down near 400 feet. The Standard, Summit and Bodie ledges dip from the east to the west, the Bechtel, McClinton and Belvidere series from the west to the east, and in the center of all is the new Standard shaft. Next to the Standard, the Bechtel is explored to the greatest depth, that of 450 feet; the Bodie, Bulwer, Belvidere, McClinton, etc., being from 250 to 300 feet. Outside of these claims (east and west) are the Black Hawk and others, doing good work. The Standard mine has in sight say 50,000 tons, that will produce over \$60 per ton, at a total cost of \$15 per ton.

In the different mines mentioned as located on the bluff there is a great quantity of ore that will produce from \$30 to \$50 per ton. The great want of the district is a good custom mill. One small one is being erected for this purpose, and the Syndicate is rejoicing, but the latter will have one of its own soon, thus adding to the want in question.

A most striking feature of the operations in Bodie is the entire absence of anything like extravagance. There is a general air of economy and good sense displayed on the part of each and every management concerned, and with such a showing it is safe to let Bodie work out its own salvation and pass on to other fields. My next letter will refer to old Esmeralda district.

J. W.

Protection of Water on Public Lands.

EDITORS PRESS:—I see in the PRESS of the 6th inst., a notice of a bill introduced by Senator Booth in Congress, concerning water rights, and which I fear, should it become a law, will prove a death blow to the mining interest of this coast, although you appear to take a different view of the matter. I wish to say here that your paper and the opinions advanced in it are highly valued by miners generally and by none more than myself. With your permission, I would like, however, to make a few remarks on this subject: "By the terms of this bill the fresh waters of all rivers and streams with a flow of more than 50,000 gallons per day, and of all lakes and ponds of more than one acre in area, upon the public lands of the United States, are reserved, granted and dedicated to and for the free and common use of the inhabitants of the State or Territory where the same are situated, for drinking, washing and the ordinary purposes of sustaining life, and the remainder, after said purposes, are reserved for irrigation and manufacturing, in their respective order, and no private property or ownership, founded upon grant, custom or otherwise, shall ever be created or allowed in such water to supersede or prevail against said common right of its inhabitants; subject, however, to such reasonable regulations as a State or Territory shall make to protect the first appropriation of water to a useful or beneficial purpose, so long as the same is actually continued against any subsequent appropriation."

Now, Mr. Editor, this language is strong and somewhat explicit. If it is not intended to immediately stop the miners from rendering these waters unfit for drinking and washing (which I believe it is), it surely is intended to have that effect some time in the future. Remember there is not any reserve, dedication or grant in this law for the benefit of the miner, except for the purpose of washing his shirts and quenching his thirst, and if one stops well down the creek and wishes to drink and wash, he can confine his neighbors above to a similar pursuit; for should one above start a hydraulic, or even a quartz mill, he will render the water useless for drinking or washing, and the drinker can

enjoin him, for no private property or ownership shall ever be allowed to prevail against this common right.

The drinking, washing, irrigating and manufacturing people in their respective order have very important rights here granted them which they have always enjoyed, while the miner is not mentioned further than to plainly tell him that he must cease to muddy the water, and for fear it should be hard to operate this law on account of vested rights, a clause is inserted to take care of the future at least.

Let us have another quotation. "Hereafter all surveys of public lands, and all grants of the same, to promote use or ownership shall be made to conform to, and provide for the reservations and dedications; and all patents made in this act, shall be made subject thereto by express terms." Now, Mr. Editor, this all must mean something, and be intended to serve some purpose. The next question is, what can that purpose be. The inhabitants of this country have always enjoyed all the above specified rights as fully as they will after Mr. Booth's bill becomes a law, unless, as I before said, it should have the effect to keep the water clear where it is now muddy. As for men posting notices merely, and holding valuable water rights, our State codes so amply provide for that as to render Mr. Booth's bill unnecessary. If Mr. Booth's bill is not intended to settle the debris question I mistake it, and if it should succeed, it will be thorough work, for it would not only stop all placer mining, but rest assured the last quartz mill is built, and few of those now in operation would continue to run, because one large mill spoils the water for drinking of a large stream and washing for many miles.

I do not suppose that there is a man in California who would wish to entirely stop the mines, but there are a great many who would stop some of them long enough to force their owners to pay an enormous price for property of small value. Permit me to give you the opinion of one long experienced in mining; and that is, that if this business is to be carried on at all, it must have a legal standing equal to that of other property and business. It is too risky to be he sustained on anything short of this. My object in writing this is more to call out discussion than to discuss. I manage a small hydraulic claim, which I am much better qualified to do than to write. I hope to see this matter discussed by abler pens than mine, and if they show that I take the wrong view of this matter, so much the better.

ANDREW JACKSON.

Washington, Plumas county, April 21st.

Salt River, Arizona.

It was long supposed that the brackishness of Salt river, Arizona, was caused by the stream running over a bed of salt somewhere along its course. Its waters are pure and fresh from where it heads in the White mountains to within 50 miles of where it empties into the Gila. Fifty miles from its junction with the Gila there comes into it a stream of water that is intensely salt. This stream pours out of the side of a large mountain, and is from 20 to 30 feet deep. It is very rapid, and pours into the Salt river a great volume of water. Here could be easily manufactured sufficient salt to supply the markets of the world. All that would be necessary would be to dig ditches and lead the brine to basins in the nearest deserts. The heat of the sun would make the salt. Were there a railroad near the stream its waters would doubtless soon be turned and led to immense evaporating ponds. It is supposed that the interior of the mountain, out of which the stream flows, is largely composed of rock salt.

A DUBIOUS ENTERPRISE.—It is stated that a stage line will be run, after July 1st, between Fort Worth, Texas, the present terminus of the Texas & Pacific railroad, and Fort Yuma, California, the present end of the Southern Pacific. The distance between these points, by an air line, is about a thousand miles, and the travelers who may undertake to cross the continent by the devious stage route, through inhospitable wilds destitute to a large degree of the ordinary comforts of life, will be pretty apt to appreciate the speed and luxury of the railway forever after. It is safe to say that few of those who crossed the plains and mountains to reach California in the days preceding the Pacific railways have the ingratitude now to abuse the remarkable men who achieved the great work of a transcontinental railway, or to grudge those who took the risks of the enterprise a liberal return for their money and toil.—*Railway Age.*

THE Murchie mine, in Nevada, California, is proving to be a bonanza. The Transcript says: A man who has worked in nearly every mine in the county, and is at present employed in the depths of the Murchie, informs us that the strike made by that company excels for extent and richness anything he has ever seen developed in this section. Where they were working yesterday the ledge had increased to the remarkable thickness of six feet. For some time it has averaged three feet, and the rock taken out is unexpectedly rich. The Murchie is rapidly stepping into the front rank of Nevada county's bonanzas.

OVER 275 quartz locations in Custer an adjoining counties, Black Hills, have been entered.

The Revelations of Science Anticipated.

We noticed in our issue of the 13th inst. that the celebrated French chemist, M. Pictet, had succeeded in reducing hydrogen gas, by the enormous pressure of 650 atmospheres, obtaining thereby both fluid and solid metallic hydrogen. The announcement of this fact reminds us that J. S. Phillips, M. E., of this city, had expressed the opinion, some eight years since, that this might and some time would be accomplished, as may be seen by reference to the initial chapter of his "Explorers' Miners' and Metallurgists' Companion," wherein the igneous formations of the earth are treated of.

Mr. Phillips therein asserted it as probable that hydrogen, under proper conditions of great pressure, would take on, both fluid and solid, metallic forms. He has been fortunate in introducing this as well as other theories, but more particularly in advancing the idea that "the valleys and plains had sunk," and that the consequent lateral pressure of the earth's crust had produced heat and plasticity, in opposition to the previous notion that mountains had been elevated. In these views he preceded Mr. Mallet, and obtained much credit at the time from the London *Mining Journal*, the *Quarterly Review*, MINING AND SCIENTIFIC PRESS and other papers.

When Mr. Phillips's work was issued, while all admitted it to be very comprehensive and valuable in its practical portions, some deemed his "theories" too speculative and not sufficiently conformable to the theories of other writers; wherefore an allusion now to these facts is the more pertinent, as they form keystones for his arguments.

From Mr. Phillips's hook we quote as follows: "All volcanoes discharge more or less steam, and it has been therefore supposed that proximity to water is a necessity for their existence, but the very rims of the oceanic basins, where they generally lie, have been and are being formed by that same compression which creates and sustains their heat, whilst the hydrogen of this water may have proceeded from the interior of the earth, where under sufficient pressure it may lie in liquid or solid state, until it is by some means removed, when it might create even the electric power, whilst the actual water—derived just like the ocean itself from this internal source—was but the product of combustion, with atmospheric oxygen at or near the orifice." * * *

"These principles of pressure and heat have not been sufficiently studied or experimented on by geologists." * * * In speaking of steam, he says: "As water possesses so many other peculiarities, may it not have the additional property of becoming again liquid, or of being reduced to hydrogen under certain pressure and heat, thereby affording the nucleus of central fuel for the formation of worlds as the pressure is removed at the proper degree of temperature and ignition or oxidation of this, thus formed metallic hydrogen ensues. It may be possible that the vapor again liquefies or solidifies, after losing all its latent heat, under sufficient pressure, and on the release of pressure the elements of hydrogen and oxygen may become free and reunite when ignited as the vapor of water." * * *

"Since the date of the first edition of this hook containing the above remarks, those astounding explosions of burning hydrogen from the sun to some 200,000 miles above its surface, prove that liquid or solid hydrogen must exist under suitable conditions in the interior of that body, and thus supply the fuel for its formation. If this is so in the sun, may it not be acting in a like manner, but with less power, in our globe, and thus create volcanic force, which by bursting occasionally under certain portions of the crust, as described in the fourth chapter, produces earthquakes, and accounts for the formation and presence of the water discharged through red-hot craters."

Additional remarks from this author might be quoted, illustrating the extent to which the results attained by this French scientist, by means of pressure, were by him anticipated.

THE GREAT FREIBURG TUNNEL.—The famous Rothschenberger water audit for draining the Freiburg mines has been completed, after a period of 30 years, and is said to be the greatest work of the kind that has ever been undertaken to aid the explorations of a mining district. This immense tunnel, as described, is ventilated by eight air shafts, and lies some 400 feet below the deepest Freiburger water audit. It has a uniform height of nearly 10 feet, with a somewhat smaller breadth, and when completed, will be, with its ramifications, 31½ miles in length. The gradient of the floor is only 0.03 m. in 100 meters. This small gradient may make it necessary to clear the tunnel occasionally, but this can be accomplished without difficulty with suitable boats and dredges. Five miles of the tunnel are perfectly straight, without a curve, and along the whole line the curves are very light. The remarkable fact also appears that nearly the whole driving of this vast tunnel, the rock throughout almost the entire length of which is solid gneiss, has been done by hand.

SPIRIT WRITING.—A New York professor explains that "spirit writing" can be produced by using sulphate of quinine as ink, the same being invisible until brought out by electric light thrown upon it through blue glass.

MECHANICAL PROGRESS.

Notes on Boiler Making.

A report has lately been made by Mr. Henry Hiller, chief engineer of an English Boiler Insurance company concerning defective boilers; and it will be interesting to boiler makers to see what the insurance examiner considers defective points. Those constructed of good material and with good workmanship, but on defective plans, may be both troublesome and dangerous in use; hence the great advantage of obtaining full and detailed specifications, founded on long experience and careful observation, previous to ordering new boilers. Large numbers of small vertical boilers are constructed of simple form, and with very limited heating surface, and are often most wasteful of fuel. The chimney tubes of many being unprotected above the water line become overheated and sometimes collapse, whilst the excessive expansion from this cause induces serious grooving and occasionally accelerates explosion. In many "Lancashire" "Cornish," and other boilers, due allowance and arrangement is not made for the unequal expansion which occurs in some degree in boilers of all constructions. In many boilers proposed, which were doubly riveted at the longitudinal seams, this riveting was badly arranged, the area of the rivets being much in excess of that of the plate between the rivet holes. In others, large flue tubes were not suitably strengthened, or the plates used were so thick as to lead to a leakage at seams or fracture in ordinary work. In some flat-ended boilers the gusset stays are not carried a sufficient distance along the shell, hence the ends often become bulged and dangerous. Gussets should be attached both to the shell and ends by double angle irons, the latter gripping the gusset plate between them. The fittings are often of inferior construction or badly arranged, which manifest the great ignorance frequently displayed in the setting of boilers, leading to their becoming dangerous through external corrosion, etc., and to great waste of fuel, through the difficulty of cleaning the flues and the plates of the boiler. I strongly recommend for high-pressure boilers that the manhole mouthpieces should be of wrought iron, with faced joints; also that the clumsy cast iron fronts for furnaces of internally-fired boilers should be entirely discarded.

BROAD CARS ON NARROW-GAUGE TRACKS.—A matter of no little practical interest to railway mechanics may be found in the result of an experiment on the Denver and Rio Grande railroad in running standard gauge car bodies on their narrow-gauge road. The Ligonier Valley railroad was the first narrow-gauge road in the country to try this experiment, but a correspondent of the *Railway Age* says they are now running broad-gauge cars over their three feet gauge with complete success. The Washington City, Virginia Midland & G. S. railroad are building a narrow-gauge branch from Ward's Springs, a station on their line, to an iron mine about 10 miles distant, and have contracted with R. H. Ramsey, of Philadelphia, for an apparatus for transferring their broad-gauge car bodies to and from their main line. Experience will demonstrate that by this means narrow-gauge roads can be made profitable which would otherwise not pay expenses. The superintendent of the Ligonier Valley railroad writes to Mr. Ramsey as follows: "I am able now after several months' experience to say that there is no difficulty in the broad-gauge car bodies running steadily on narrow-gauge tracks. We ship and transfer cars of cattle, hark, lumber and ties, etc., without any special care of adjustment of the load to the center of the car, and have not in any instance discovered the slightest tendency to sway or upset. The other day a Fort Wayne car arrived on the Pennsylvania railroad loaded with a portable saw mill (boiler, engine, etc.), to go up our road—quite a heavy and top-heavy load—yet our men transferred the car body as it stood without hesitation, and took it to Ligonier without difficulty."

AMERICAN PLANISHED IRON.—An exchange says: The greatest victory yet achieved by American patent planished sheet-iron is its use on the jackets of the 40 locomotives built by the Baldwin Locomotive Works for Russia. This iron enters into competition with the well known Russian iron for such purposes, and is in fact its only rival. That its quality is all that could be desired is strongly evidenced in this fact, for certainly such a house as the Baldwin Locomotive Works would not put it on locomotives designed for Russia unless they had been thoroughly convinced, from actual experience, that it was the equal of the Russian iron.

CLEANING OIL WELLS.—A description is furnished in a Pennsylvania paper of the latest invention for cleaning out oil wells. It is an iron ram, 37 feet long, weighing 2,100 pounds. The mode of working is to fill the well with water or oil above the sandrock, then pump out the air, and when the air is exhausted or nearly so, to drop the ram into the well. The ram will have a drop of 800 feet and a pressure of 77,000 pounds to the square inch, which will force the water or oil into the crevices of the sandrock and in this manner open up the rock and let the oil enter the well. In fact, it will have the same effect as steaming or torpedoing.

Centering and Turning.

Workers at the lathe will be interested in some remarks on centering and turning, which a veteran Ft. Wayne machinist writes for the *Railroad Gazette*. He says that in many Western shops far too little attention is paid in having the lathe centers all turned to a standard gauge and the centers countersunk to fit exactly and drilled. Some men think it does not pay to center light work any other way than with a center-punch, where they do not have cutting-off and centering machines. But this the writer thinks is a most erroneous idea. In his opinion, using punched centers with a center punch ground on the stone is a barbarous practice. No wonder the dead center is always in bad order, cutting and squeaking. The fact is, putting good centers in work is of as much importance as the foundation of a house, and every thoroughbred turner that has served an apprenticeship on the right side of 21 knows it. I have seen boys take work to the vise, he continues, drive a center punch into it, take it to the lathe, chalk the full sides, take it back to the vise, draw the centers, and try again; whereas, if they would put a square or center cutting in the spindle of the tail-block or head-stock and push a tool gently against the full side, it would come true in an instant. The main advantage of square centering is the superior quickness over all other methods. I have seen lots of light work from an inch and a quarter down centered by sticking one end into a hollow V-shaped socket live center, without putting a dog on one end or stopping the lathe at all. In almost any shop a boy for a few shillings a day could be kept constantly centering and drilling for all the light lathes, and then they would have good, permanent, properly shaped center or countersinks, and their centers would last for many months. I have seen good centers put in car axles by having the centers turned to the gauge and hardened to the proper temper by being fitted into each end of a wheel press and then pressed to five-eighths or three-fourths diameter. The centers are much harder, wear better, and are less liable to cut and squeak than if countersunk with a cutting center. I have seen hundreds of axles centered in this way, and no perceptible wear on the centers that did the pressing, although in constant use for years. Some men have a great notion of turning wrought iron dry with a very fine feed and quick speed, and then rasping into it with a file. That may do for old, dirty, sandy iron; but I contend that except for very light work a water-cut without filing is the better way and much quicker. A man that can scrape cast iron without chattering or jarring, and does not require files and sandstone, or can finish wrought iron balls, handles, ogees, fillets, bulges and hollows without the use of files has an immense advantage over one who can't.

HORIZONTAL STEAM ENGINES.—At a recent meeting of the English Society of Engineers a paper was read by Mr. W. Schonheyder on "Equalizing the Wear in Horizontal Steam Cylinders." The author, after noticing the large extent to which the horizontal engine was used at the present time in preference to the older type, the beam engine, explained that one objection to its use was the great and unequal wear of the cylinder, which was due to the weight of the piston continually rubbing backwards and forwards on it, and to the difficulty found in lubricating it efficiently, especially when the cylinder was kept hot by the now universal steam-jacket. After enumerating the evils resulting from the unequal wear of cylinders and pistons, the most important expedients for preventing it were described, and the author's reasons given why they could not fulfill their purpose in practice. The author then gave a description of his method of remedying the evil. This was stated to consist in making the piston-rod with a camber or upward bend in such a manner as that when loaded with the weight of the piston and placed in the cylinder it assumed a straight line, and transferred the weight to outside guides. Special tools are used which render the production of these rods easy and certain.

SHEET IRON FOR THE PARIS EXHIBITION.—The *Engineer* understands that some of the largest iron sheets ever made in Bristol—or, indeed, in England by a two high roll sheet mill—have recently been rolled at the works of Mr. Joseph Tinn, C. E., the Ashton Iron Rolling Mills, for Messrs. W. B. Wright & Co., Bristol Galvanized Ironworks, St. Philips, where they will be galvanized and corrugated and then sent to the Paris Exhibition. The sheets vary in size from 10 feet to 16 feet long by 30 inches to 3 feet wide, and are 24 to 27 gauge, or from one fortieth of an inch to one sixty-second of an inch in thickness. In regard to quality and finish, the sheets are very superior, and reflect great credit on Mr. Tinn's manager, Mr. John Harris.

STEEL VS. IRON RAILS.—In his last annual report, President Gowen, of the Reading (Pennsylvania) Railroad Company, makes a contribution to the discussion concerning the relative economy of iron and steel rails. He says, "Notwithstanding the enormous traffic of the company, out of 150,787 tons of rails made at the rolling mill and laid on the track since 1868 inclusive, but 25,851½ tons, or 17.1-10%, have worn out—a result that fully justifies the wisdom of adhering to good iron rails during the period when the difference in price between iron and steel was so great as it has been in all years prior to 1877."

SCIENTIFIC PROGRESS.

THE ORGANIC ORIGIN OF LIMESTONES.—According to the *Polytechnic Review*, Prof. W. C. Williamson has lately given definiteness to the long cherished belief of geologists, that the great rock masses of limestone that enter into the composition of the earth's shell had their origin in the gradual accumulation of the remains of microscopic organisms. His observations were directed to the task of studying limestones in which no trace of these organic remains were visible, and has been fortunate enough to have for a specimen a slab of rock containing a large chambered shell. Outside of this fossil the limestone slab, the evidences of the organic constitution of the rock was barely distinguishable, the relics of the microscopic shells being only faintly recognizable here and there; but within the large shell they were found in excellent preservation, the body of the latter having resisted the disintegration action of the percolating water, containing carbonic acid and other solvents, sufficient to protect the delicate remains of these microscopic organisms from the solution and disappearance which they suffered outside of it. The dense texture of most of the limestones, which frequently exhibit no trace of their organic origin, can readily be explained to result from the metamorphism which the rock masses undergo by the solvent action of meteoric water containing carbonic acid, which, in time, more or less completely disintegrates the delicate shelly relics of which they are composed, and gradually renders the whole texture of the rock homogeneous and uniform even to the microscope.

ONE OF THE HIGHEST MOUNTAINS.—According to recent geographical surveys, the *Scientific American* says it seems the Aconcagua peak is the loftiest of the Andes range, and the highest in America. It is 100 miles east of Valparaiso, and nearly in latitude 32° 30' south. Its actual height is not accurately known, but the measurements made by M. Pissis, and other noted scientists make it reasonably certain that the elevation is between 22,400 and 23,000 feet above the waters of the sea. The French explorer made it 22,422, or four miles and 1,302 feet over, which would be 998 feet higher than the snowy summit of Chimborazo, as Humboldt measured the latter, when in 1802 the great German made his famous ascent of that mountain with Bonpland to a height of 19,286 feet. Aconcagua, seen from the Chilean seaport of Valparaiso, is shown only as a peak, towering above the other heights of the Andes at a distance of 100 miles or more inland, toward the sunrise. Aconcagua has been called an extinct volcano, but the best examinations yet made of its summit do not appear to bear out the idea. The recent observations make the height of the Chilean mountain 23,200 feet, and "probably" over that figure. The elevation of Mexico's highest mountain—Popocatepetl, or "Smoking mountain"—is nearly 5,000 feet less than that of the Chilean peak, and Mount Shasta and Mount Hood fall short about the same figure. Pike's peak is about 9,000 feet lower than Aconcagua.

TRANSFORMATION OF CARTILAGE INTO BONE.—The last *Bulletin* of the Belgian Academy of Sciences (Vol. XLIV., No. 11) contains a very valuable paper of Dr. Lehoucq, Superintendent of Anatomical Researches at the University of Ghent, on the mode of formation of the bone tissue in the long bones of mammals, in which the author discusses and resolves by his researches, based on a new principle, the much debated question whether the embryonal cartilage is substituted by a new tissue, or is directly transformed into a bone. The great difficulty of rendering the minute cartilage cells apparent among other cells is resolved by the author by his employing soda, and decalcifying the sections with acidulated glycerine; the cells thus preserve their shape, and receive a beautiful color, as is seen from a chromo-lithographed plate accompanying the paper. By using this method the author was enabled to prove that the minute cartilage cells take an active part in the formation of bones, quite performing the part of osteoblasts. The researches were carried out in the Ghent Laboratory, under the direction of Prof. van Bambeke, and the paper is accompanied by a very favorable comment thereon by Prof. van Beneden.

PERPETUATION OF PHYSICAL TRAITS.—M. Lenglen, a physician of Arras, has recently described a remarkable perpetuation of physical traits. A certain M. Gamelon, in the last century, was sex-digital, having two thumbs on each hand and two great toes on each foot. The peculiarity was not noticeable in his son, but in each of the three subsequent generations it has been strongly marked, some of the children at present showing the malformation as distinctly as their great-grandfather. M. de Quatrefages has noticed, a few months since, a similar case in the animal kingdom. A six-toed cock having transmitted this peculiarity to his descendants, it has spread to such a degree that in the district where it occurred the ordinary five-toed variety is no more to be met with.

MELTING POINT OF PLATINUM AND SILVER.—J. Violle (*Comptes Rendus* 1877-85, p. 546) determined the melting point of silver to be 954° C., and that of platinum 1779° C. The latter appears rather low.

A QUARRY OF INDIAN RELICS.—A discovery that will prove of interest to antiquaries has been made in Johnston township, Providence county, R. I. The exact locality is about 100 yards north of the Killingly pike, on the Big Elm farm. Mr. H. N. Angell, of Providence, while engaged in quarrying slate at the place above indicated, found a soapstone bed between two slate ledges about six feet under ground. Carloads of pulverized stone were removed, without any suspicion that it was the debris of an ancient mine. At last the surface of the soapstone rock was reached, and this was so curiously carved as to attract the notice of the workmen, the entire surface being covered with hollows and projections. This was a rock from which the aborigines had carved soapstone dishes and utensils. The method was to cut away the stone from a circular portion till that was left as a projection, and then cut under the projection until it was detached, after which the block thus obtained was hollowed out and became a dish or bowl. The work had been done with knives and hammers of stone, the slate furnishing a sharp edge to cut, chisel and scoop out the soapstone. One of two stone hammers found weighs nearly 100 pounds, and was hollowed in the middle, probably so as to be bound by thongs to a handle. Already 150 cuttings for bowls that never were finished have been counted in the soapstone. The ledge itself had been cut down by the aboriginal workmen, in this manufacture, several feet below the original level. Large numbers of stone hammers and axes have been found by the explorers. The rock is soft, and some copper, silver, talc and asbestos are associated with the soapstone.

DETECTION OF TRICHINA.—In recent years some attention has been attracted to the *Trichina*, one of the most formidable of human parasites. It is known that this microscopical worm, encysted in pork, is therewith conveyed into the alimentary tube of man, and penetrates into the tissues of the muscles, causing intolerable pains, and even sometimes death. This year a number of cases of trichinosis have been met with among the soldiers of the German garrison of Thionville. To detect the trichina, suspected meat is often examined with the microscope, but the method of examination is rather inadequate. A Russian servant, M. Tikhomiroff, has suggested a new mode of isolating the muscular fiber. He divides the pork into small pieces, and sets it to digest for about half an hour with an equal volume of chlorate of potash, to which is added four times as much nitric acid. The muscular tissue thus treated is put into a flask with distilled water and agitated till it separates into its fibrille. These latter present, when the meat is infested with trichina, whitish fusiform swellings, observable with a lens, and in which the microscope reveals the presence of trichina.

ANALYSIS OF ADULTERATED BUTTER.—The City Chemist of Cleveland, Dr. Claassen, in a recent report on butter, adulterated by mixture with lard, gives a simple method of testing for this fraud. The suspected butter is melted, and about fifty grains of it poured into a test tube. When this is cooled to the temperature of the human hand there is to be added, mixing slowly by agitation, 120 grains pure sulphuric acid. If the butter is pure, the mixture will at once become yellow, and afterwards a bright yellowish red. If lard is present the mixture will pass from the color last named to a brownish red, brown, and brownish black. Turmeric or annatto is frequently used to color adulterated butter. To detect either of these dyes the butter should be melted and shaken with twice the quantity of alcohol. The butter having subsided, the dye, if any is present, will appear above, in solution, in the alcohol, and tint it yellow; but from pure butter no color will be extracted.

INFLUENCE OF CLIMATE ON RACE.—Attention has been called to a curious instance of climatic influence on race. In 1816, several hundred Wurtemberg families emigrated to Transcaucasia, and took up their abode in the neighborhood of Tiflis. They were remarkable for a broad, square built, fair or red hair and blue eyes. The next generation changed somewhat, and brown hair and black eyes were seen. In the third generation the type of the original colonists was hardly recognizable. Black eyes and hair were the rule, the round face lengthened, the form gained slenderness and elegance. Inasmuch as they never inter-married with another race, it is contended that climate alone must have effected the change.

ADULTERATION OF BONEASH WITH PHOSPHORITE.—We read in *Dingler's Polytechnic Journal*, that A. V. Wachtel has discovered a large amount of phosphorite in samples of boneash. As this substance dissolves so slowly that it is of very little practical value as a fertilizer, and is especially deceiving, as it would yield to ordinary chemical tests the proper amount of phosphoric acid. It can be detected by the large amount of iron present, by the fluorine, also, as well as by microscopic investigation.

THE PRODUCTION OF METALLIC FILMS BY ELECTRICITY.—A. W. Wright, *Journal of Franklin Institute*, 1877, vol. 103, p. 242, in the course of some investigations found, in discharging a powerful induction coil through a vacuum, that the metal electrodes were partly disrupted, and a fine film of the metal might be deposited of any desired thickness. He suggests the use of this method for producing transparent mirrors of the different metals for optical purposes.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

GOOD ORE.—*Ledger*, April 20: Griesback's quartz claim a few miles above Volcano is one of the richest in the country. The vein is small, as all in that section are, and a vast amount of labor is involved in taking out rock enough to amount to a crnsbng. Griesback, after months of patient toil, accumulated 130 tons of ore. This was crushed at Mace's mill, and a clean-up made last week, when \$10,000 was realized. This gives an average yield of \$77 per ton.

PHENIX.—One-half the 80 stamps are running, and all will be in the course of another week. The stamps crush on an average about one and a half tons of ore per day, the monthly yield of the mine being between \$30,000 and \$35,000, expenses about \$10,000. One hundred men are employed here, and the mine is looking extremely well.

THE SEATON mine keeps a 10-stamp mill running, the gold taken out covering expenses. Some profit would accrue but for the cost of hauling the ore two miles over a bad road. There is a talk of building a new mill near the mine.

POTOSI.—This mine, near Drytown, is looking well, and if no unforeseen bad luck intervenes, will soon step up in the first rank of our paying mines.

BUTTE.

BUTTE CREEK MINES.—*Record*, April 20: The Shepard ditch will be in Whisky flat one month from the present date. There the half of said ditch will be piped across to the east side, and run in a ditch down to Diamondville, while the other half will be ditched down the east side to, or nearly opposite the same point on Butte creek. There are now about 120 Chinamen, and 30 or 40 white men working on the ditch, and a great many more will soon be employed, and as soon as the water gets well on the hills, there will be a chance for a great many miners to work at good wages; or if they get water at reasonable rates they can work for themselves.

CALAVERAS.

MOSQUITO.—*Citizen*, April 20: Mining affairs here look encouraging. A lot of 90 tons of ore milled over \$35 per ton. The San Bruno company have out over 200 tons of ore, worth between \$30 and \$40 per ton. Their mill will be run on this and custom ore for a number of weeks. The Blue Jay have a seven-foot ledge, and 100 tons of ore on their dump. The San Joaquin mine will soon be running, and a mill be built to crush the ore. At the depth now reached the Leghorn ore fails to pay, but it is expected the ore will come in rich at greater depths.

EL DORADO.

QUARTZ MINES.—*Republican*, April 25: In a day or two the hoisting works on the Pacific mine will be started, taking the water from the old shaft and drifts at a rate that will soon drain it, after which ore extraction will commence. At the Rose mine the hoisting works have been completed, and will soon have it free from water. The machinery at the Keegan has steamed up, the shaft is being sunk, and some good ore taken out. The True mine is being worked with flattering results, and some improvements are being made on the machinery. There is much mining going on about Kelsey's.

GOLD IN THE HIGHWAY.—*Mountain Democrat*, April 27: Last Monday Hughey Roberts, while hunting a cow, saw a piece of loose quartz rock in which gold was visible. Carrying it home and breaking it up it was found to contain at least \$20 worth of gold. Some of it was in handsome specimens. This piece of rock had lain in the middle of the road, at the upper end of Placerville, for quarter of a century and been passed over many times by wagons, one of which at last broke off a small piece, exposing the gold.

RICH SPECIMENS.—Hallock is bringing up daily specimens from his claim on Big canyon thickly studded with free gold and heavy with sulphurets. The ledge promises to be a counterpart of the Hayward mine in Amador county. The facilities for extracting and working the ore are superior.

INYO.

DEFIANCE.—*Coso News*, April 20: In the drift being run to connect with the large ore body in the north works of the Defiance mine, the hard lime face has given way, and ore is now being extracted by the workmen drifting from both ends to meet one another. The connection will have been made in a few days, when ore can be extracted in sufficient amount to keep the furnaces running a long time. They will undoubtedly be started up early next month.

MOBAC.—The mine is looking well, the furnaces are to be started up soon, and there is a good prospect of a lively and profitable season for the company.

THE Kearsarge tunnel is in nearly 500 feet, heretofore all the way in solid granite, but now in quartzite or some such rock, showing such a change as to give the biggest hope of soon striking the ledge; but if not struck sooner the tunnel will be driven at least 500 feet further.

NEVADA.

THE IDAHO.—*Grass Valley Union*, April 25:

The big compressor has been started on this mine, setting the power drills again in motion. On the 10th level, several hundred feet east of the shaft, a large chamber is being excavated, in which a steam engine, to be run by compressed air, is to be stationed. From this point a large winze is to be sunk, through which the mine will hereafter be developed below the 10th level. As the ledge at the bottom is now showing larger than formerly, it is found necessary to increase the crushing capacity of the mill, and in addition to the present 35 stamps, 15 more are to be added. Another cage will also be put in the large four-compartment shaft, which will give three cage compartments. More water will be required for the mill, which renders it necessary to enlarge the company's ditch. All these improvements and enlargements are consequent upon the increased power and production of the mine, and it will take about three months before they are all completed. With the increased power the mine can be worked to the depth of 2,000 feet or more; and with 50 stamps the reduction works will be ample for all purposes during the life of the mine. More power drills will also be used in order to supply the increased number of stamps. It is California's great gold mine, having paid 104 regular dividends, amounting to over \$2,300,000.

PLACER.

LITTLE YORK.—*Dutch Flat Forum*, April 27: Hydraulic mining in the Empire and Christmas Hill mine was resumed and has been kept in steady progress since January 1st. Three thousand inches of water, forced through three giants, is brought to bear with terrific force in removing the debris from the Empire mine, and twenty men, assisted by a monster derrick, are employed in blasting and removing boulders. At the conclusion of last season's washing a heavy powder blast was exploded, which, together with the pulverizing of a large amount of the bottom gravel, caused an extensive slide of clay from the upper strata, which will take some time yet to dispose of. But one clean-up has been made, resulting very favorably. Christmas Hill is worked by a force of nine men and 700 inches of water. Two clean-ups have been made, paying good dividends as usual.

YOU BET.—Washing in the Neece & West has been in progress since January 15th, giving employment to twenty men and using 100 inches of water. So far two clean-ups have been made, resulting very satisfactorily. A blast of 700 kegs of powder was exploded the first of the week, under a 200-foot gravel bank, which proved an entire success, disintegrating a very large amount of solid gravel. Washing in the Waloopa was resumed March 5th. Nine men are employed and 450 inches of water utilized. One clean-up has been made, which is reported to have considerably exceeded the expectations of the company. A good clean-up has been made at the Red Dog mine, also at the Yuba, lately purchased from Alvinza Hayward.

HAYWARD MINES.—Hydraulic mining in Wilcox Ravine, Chicken Point and the Tunnel mine has been in progress since January 1st. Six men are employed in the Wilcox Ravine, and 750 inches of water utilized. Three clean-ups have been made, resulting very satisfactorily. Ten men are employed and 400 inches of water used at Chicken Point. Two clean-ups this season are reported to have done splendidly. The Tunnel mine for some time did not wash steadily, but is now being made to boom, with 1,000 inches of water and seven men. No general clean-up has been made for the season.

PLUMAS.

TWELVE-MILE BAR.—*National*, April 20: The Hallsted claim, at Kingsbury, has been running most of the winter, and enough ground is now stripped to keep them busy, with a good head of water for a year, cleaning up. They work four men, and have made two "clean-ups," both from side-flumes and entirely from top dirt, one to the amount \$450 and the other about \$875. They have got a cut through the bedrock low enough to bottom up, and will commence on the bedrock, being certain that they will get some big pay. The Brooks claim, on Rush Creek flat, is in full blast, running two giants and six men. They have partially cleaned up twice, with good results. They will have a good head of water all the season, and cannot fail to make money. Cap. Corser is piping in good gravel in his claim on Rich gulch; has a liberal head of water, and will do well. Fred. Lewis, whose claim is on the head of the gulch, has an extraordinary head of water, considering the location, and is working some very rich ground. He will make more this year than he has in the past three seasons. Hide is piping in his claims on 12-mile bar, working three men and getting good results. Dean, Kavanaugh and Burge are at work on Soda Creek, but with what success is not known.

SHASTA.

MINING ITEMS.—*Reading Independent*, April 25: Rob. Harvey is pushing the mining business energetically in the Hardscrabble. M. H. Peck has got his machinery on the ground, and a force of men now putting up his new quartz mill on South Fork near the Chicago mill. The Dover gold and mining company have made a partial clean-up, with highly satisfactory results. In the Buckeye mining district the water is getting low and cleaning up is the order of business just now. Wm. Saffroy cleaned up \$238.40, the result of one week's run, and the week previous he averaged \$33 a day. This is good, considering that he has but one man to help him. Dave Fugua would have done splendid this winter had he not had

the misfortune to lose about \$30,000 by the breaking of his reservoir. At Churntown the miners are bringing in considerable dust.

TRINITY.

COARSE GOLD.—*Journal*, April 20: We were this week shown \$900 in gold dust taken from the claim of Soudan Bros. on West Weaver creek. With the exception of a small quantity, the whole amount was in pieces of from \$1 to \$10 in value, many of them ranging from \$5 to \$10, and the quality was above the average of the gold dust taken out in this county, all of which is good. The amount was the result of a partial clean-up in the claim, the proprietors of which say they are well satisfied with the result, and hope for larger returns when the final and complete clean-up is made.

COAL AND IRON.—Dr. P. W. Fonda has examined the coal deposit at Cox's bar, and pronounced it a well defined mine, and the coal of superior quality. He says it is far ahead of the Seattle and Coos Bay coal—containing fully 66% of carbon, and only a small percentage of ashes and water. Were it situated any place near the line of railroad, the Doctor says, \$200,000 would be a small price for the mine. As it is, the large coal deposit at Cox's bar is valueless. Dr. Fonda further states, that alongside of the coal is a beautiful vein of chrome iron, and that if smelting works were erected in that locality, pig iron could be manufactured at a very low cost.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, May 1: The Consolidated shaft will be shut down on Saturday next for repairs. These repairs will require nearly 60 days' time, as there is 600 feet of the main shaft in a very bad condition, and but a limited force of men can be employed in the prosecution of the work. During that time from 300 to 400 tons of ore per day will be hoisted through the Ophir and C. & C. shaft, so that the production of the mine will be at least sufficient to pay all the running expenses and a regular monthly dividend of \$1 per share on the stock. A large portion of the men now at work will be retained to do dead work, in opening the ore bodies, running prospecting drifts, and making necessary air connections, preparatory to work of the most active character when the repairs are completed. The usual amount of ore has been taken out during the past week, and the ore etopes from the 1300 down to the 1750 level are yielding good ore and are showing finely.

CALIFORNIA.—On the 1950 level the east drift from the bottom of No. 3 winze is steadily advancing at the rate of four feet every day, the face in dry vein matter. The joint Ophir winze on the northern boundary line below the 1840 level, will connect with the nraise from the 1900 level to-morrow or the day after. The east crosscut on the 1750 level is making good progress. Preparations are being made to sink a winze from this drift downward to the 1840 level for air purposes. On the 1650 level a good circulation of air has been secured and the north drift again started up. The south drift on the 1600 level continues to advance in low-grade ore.

OPHIR.—During the first part of the week a vein of fine ore came in on the west side of the shaft two feet thick, following which was a broken formation of quartz and porphyry, which on last evening had again given place to ore of a good quality. This ore like the small vein recently encountered in this winze, has nearly a perpendicular strike and adds considerably to the expectations of the ore vein below where it was struck. The winze and nraise from the 1700 to the 1900 levels on the California line will complete a connection to-morrow or the day following.

SAVAGE.—The lateral drifts on the west side of the ore vein on the 1640 level are each advancing and have now attained a united length of 60 feet. Both are in porphyry and afford nothing of interest. These drifts are each to be run a distance of 75 or 100 feet north and south, when crosscuts will be made to test the extent of the ore. The face of the east crosscut on the 2000 level is still in a fine, favorable make of vein matter.

BELCHER.—The south drift on the 2160 level is steadily advancing, the face still in a good character of quartz and vein matter.

JUSTICE.—The ore etopes show well on the 800 level, and the grade of the ore extracted and crushed is showing a steady improvement. The east cross drift on the 1300 level is very hot, and the progress necessarily slow. A drift has also been started northward on this level.

SIERRA NEVADA.—The 2000 station in the south double incline winze has been opened and two drifts started, one north and the other east to prospect the ore vein.

OVERMAN.—The main shaft will reach the 1600 level by Saturday next. As soon as that depth is reached a station will be opened and the shaft be sunk a few feet further, in order to give room for making a large excavation in the shape of a drift for the reception of whatever flow of water may be struck. The east drift on the 1100 level is developing a splendid body of quartz and some low grade ore.

YELLOW JACKET.—The connecting drift with the Crown Point, on the 2000 level, has been thoroughly timbered, a good track laid for the cars and boxes are now being put in to carry the water through to the Belcher shaft. Preparations are also being made to hoist the rock through the Crown Point shaft. The new shaft is now down 1,400 feet.

BEST & BELCHER.—The joint winze on the

south line of the Con. Virginia reached a depth of 1,900 feet at noon to-day, the bottom still in porphyry, carrying streaks of fine looking quartz.

HALE & NORCROSS.—Everything is now in the best of shape, and the pumps, working in conjunction with those of the Savage, are gaining rapidly on the water in the shaft.

CHOLLAR-COMBINATION SHAFT.—The rock in the bottom is somewhat softer and the flow of water quite strong, averaging about 36,500 gallons per day.

JULIA CON.—The south drift on the 2000 level is steadily advancing at the rate of eight feet per day, the face in porphyry and quartz mixed. No crosscut in the ore vein has yet been started.

BULLION.—The east drift on the 1840 level is being pushed ahead, the face in favorable vein matter, carrying some very encouraging quartz. It is believed that this drift will, in a very short time, reach the main ore vein, when hopes are entertained that paying ore will be developed.

CROWN POINT.—Sinking the winze below the 2000 level is making good progress. It has now reached the 2300 level, where a station will be opened immediately and a drift started southward to connect with the Belcher line on that level.

GOULD & CURRY.—But slow progress has been made during the week in draining and repairing the drifts on the 1900 level.

ALTA.—A strong flow of water was struck during the first part of the week on the 1350 level which has prevented any further prospecting at that point.

LADY WASHINGTON.—The north drift on the 1000 level is steadily advancing, following the west wall of the ore vein, cutting occasional spots of good quartz.

SILVER HILL.—There are no changes to report of any of the prospecting drifts on the 800 level. The east drift on the 900 level is steadily advancing, the face in very lively vein matter.

SENATOR.—The Sutor tunnel has now nearly reached the western boundary of the mine, opening it to a depth of over 1600 feet below the surface.

MEXICAN.—The joint east crosscut on the Union Consolidated line is now in a distance of 280 feet, the face in hard porphyry.

EUREKA DISTRICT.

RICHMOND CON.—*Sentinel*, April 24: Several important improvements, of an economical nature have been made here during the past week. The refinery boilers are undergoing extensive repairs, new flues and plates being put in, and as soon as completed they will be ready for any emergency that may arise. It is a busy scene in and around the works, but everything moves with the system and regularity of clock work. Three calcining pans, and four crystallizers are in operation at the refinery. All of the April output of crude bullion at the works is stacked up in the yard awaiting refining.

EUREKA CON. Co., have since last September, disbursed to their fortunate shareholders, \$1,200,000 in dividends, or \$24 per share. Pretty good showing that for a mine whose shares were selling for \$12 one year ago. The late storms insure Eureka an abundant water supply during the season.

ORE PLENTY.—The large amount of ore in sight at the Hamburg mine justifies the statement that when the company's furnaces start up it will be for a long and profitable run.

ORE SHIPMENTS.—The ore shipments to Salt Lake are quite large in volume, and are becoming a regular article of freight. There is probability of there being considerable competition among Utah buyers for our high grade ores.

CHARCOAL.—The daily receipts of charcoal for the past month has averaged 12,000 bushels. The largest portion of this has been received by rail.

PARADISE DISTRICT.

ANOTHER GOOD FIND.—*Silver State*, April 26: Another new mine, said to be the richest yet discovered in the district, was found last Sunday by a man named Jackson. The new find is situated about two miles from the Big Prize, and the ore is said to bear such a resemblance to that found near the surface in the Grand Prize that experts cannot tell one from the other.

Arizona.

THE WANA WHATA.—*Citizen*, April 19: Work on tunnel pushed night and day with all the men that can be advantageously employed. The ore assays up into the thousands, a good deal being now on the dump. A five-stamp mill is in course of erection for concentrating the ore, also a furnace for reducing the concentrations into bullion. Several other mines in the vicinity are being opened with excellent prospects.

GLOBE.—The principal mines on the quartzite hill are the Silver Era, Etna, Webster, Mountain View, Julian, Chloride, Jackson, McNelly, Silver Prince and Fan, yielding ore ranging by assay from \$100 to \$5,000 per ton. Messrs. Watson & Milner have shipped 16 tons of ore from the Era and Etna to the mill of Tidwell & Co., at McMillen's camp, for reduction; the ore from the Era so far is yielding about \$1,000 per ton, and that from the Etna about \$300; the ore works to over 90% of assay. The Miami mill has shut down, they having no water, but are sinking and drifting for it, and will soon be able to start up again. The ore worked cleaned up about \$80 per ton. Nothing is being done on the Byron and Bixby mines.

STONEWALL.—Over six tons of the richest ore

ever shipped from the Territory, is at Collingwood & Co.'s awaiting re-shipment to Yuma. Since the middle of September, more than 16 tons of this character of ore has been shipped from the mine, the average yield of which is something over \$8,000 per ton. In addition to the native silver ores shipped to San Francisco, the company have crushed at the mine more than 50 tons of ore, which has paid much of the expenses of the mine. The present shipment is the largest and richest ever made, and as it comes from the lowest workings on the mine, argues well for the continuation of the rich vein, which has already yielded the original cost of the mine. The mine has kept from 30 to 40 miners employed all the time, and the Secretary informs us that they have paid out nearly \$30,000 in mining, buildings and improvements. The last accounts are that a rich stratum of chloride ore has been discovered, which promises well for the future. Already several hundred pounds of ore have been extracted from this vein, most of which is rich in chlorides and sulphurets.

Colorado.

BOULDER NEWS.—*Denver Tribune*, April 24: There are to be two new reduction works erected in this county during the coming summer. Mr. Pomeroy also contemplates adding some kind of works to his concentrating mill at Ward. The Ni Wot company's mine and mill at Ward were sold at a master's sale last week, and bought by Mr. W. A. Davidson for a little more than \$3,000. The mill alone cost over \$200,000, and the whole property was stocked for \$1,000,000. There is no redemption under the sale.

GEORGETOWN.—A spring opens the old prospectors and miners begin to look around for outcrops for a summer's prospecting tour. Glowing accounts come to us from our mines.

BOULDER.—*Denver Tribune*, April 17: With the advent of pleasant weather things are getting more lively. The Black Cloud and the Atchison mills are running. The Everett will soon start up. The two concentration mills in Telluride are also at work when suitable ores are obtained, which is not all the time. Lode mining goes on briskly, and there is a fair output of marketable ores. Gulch mining is again occupying the attention of claim owners, several of whom have gone to work during the past week.

Idaho.

GAMBRINUS DISTRICT.—*World*, April 19: The proprietors of the Forest King mine have run their east drift twenty-five feet, and the ledge looks well. They will continue on till the pay gives out. As soon as a ear can be procured the west drift will be commenced, which will be in a few days. They already have a large quantity of first-class ore on the dump. Jerome Beardsley is opening up a mine on the new road, with good prospects. New hoisting works have lately been erected, and things have a business look. Messrs. Leighty, Tuck and Brown are opening up their new mine in earnest, washing the surface off for the purpose of gathering up the float rock, while the water lasts. Messrs. Patsy Marley and Chris Wilkie have a genuine bonanza. Their mine prospects as well as any in that section. It contains very coarse gold. The boys are running a tunnel, which will be 125 feet long, to tap it 100 feet in depth. The late rich strikes in the district have encouraged a large number of the boys to sally out on the prospect, and we estimate at least 75% more rock will be milled this season than last.

DRIFTING CLAIM.—Kean and Hall, who employ 23 men, have a large quantity of dirt extracted from their drift claim. That taken out this winter is better than any heretofore reached. The pillars left prospect well and will keep the company at work for four or five years, when the main tunnel will be pushed ahead and operations changed to the south side. The dirt on the dump will be washed up in five or six weeks, when a clean-up of \$10,000 or \$12,000 is expected.

Dakota.

BLACK HILLS.

GAYVILLE.—*Times*, April 13: Forbes & Co.'s mill started yesterday and so far proves a wonderful success, as far as crushing is concerned. The capacity of one of the crushers is 24 tons in 24 hours. Three more crushers will be added as soon as they can be delivered here. Ground for a foundry has been bought to-day for Forbes' mill on No. 2 claim above discovery.

RICH STRIKES.—Some very rich rock is being taken from the Whitewood mine at Elizabeth town. There is 600 tons of ore on the dump of the Floreman mine that will average \$100 to the ton.

MINE NOTES.—There has been a stampede from Deadwood for Bear Lodge mountain. There is a reported discovery of a six foot vein of coal within 10 miles of Deadwood. A 20-stamp quartz mill will be running at Potato gulch about the first of May. The assessments in Lawrence county for this year amounts to \$2,000,000 valuation. The springs at Oil City have been running freely during the late warm weather, and it is thought they would yield at a profitable rate if they were properly opened up. One hundred and eight tons of ore from the Rhoderick Dhu lode, crushed at Cunningham & Dorringer's mill, yielded over \$10 to the ton.

The Sunshine mine at Central is looking way up. An assay of this ore was made yesterday and the owners immediately afterwards

raised a couple of hundred thousand dollars on their former price for the property. The lead is lying parallel with the Alpha mine, and it is thought will turn out as rich as any on "the belt."

Montana.

SUN RIVER.—*Madisonian*, April 13: The striking of what is supposed to be the channel of an old river has caused some excitement here, many claims having been staked off and some prospecting holes sunk. Some fair but not very rich dirt has been found. Mining operations are rather quiet at present about Bannock, but will brisk up again in a few weeks, in both placers and quartz.

BUTTE.—The Alice company are shipping bullion—from \$15,000 to \$20,000 per week. The Walker Bros. mill has shut down for repairs. One man, employed during the winter in the Mount Pleasant mine, has taken out \$7,000 worth of ore.

Oregon.

GRAVEL WASHING.—*Sentinel*, April 24: Frank Ednis is making the dirt fly at the Sterling mines. Everything is working finely now and no trouble is experienced with the ditch. Wm. Bybee made a partial clean-up at the Taylor diggings last week, and realized \$600 from two boxes.

BURNT RIVER.—The miners here working in the placer diggings are generally doing well, all making moderate, and some of them large wages. The prospects of the camp are as good as any in eastern Oregon, the mines not being deep or rocky, with water until late in the summer. One or two small quartz mills are also running.

Utah.

FRISCO MINES.—*Salt Lake Tribune*, April 25: North Star, where work has been continually prosecuted, has struck a body of high grade galena and silver ore. It shows six feet in the lower works and keeps improving as development progresses. The Wisconsin in the same district, has struck a body of ore, of which about thirty tons have been worked at the Frisco smelter, sampling about \$225 per ton in silver. The ore carries but little lead. The Bonanza is still improving, and the ore body is without end. Both smelters are kept running on their rich horn silver. The Shautie smelter will again start up, causing the working of the mines in the surrounding districts as well as in Star. The Bonanza company's smelter continues to run, and is rolling out its usual amount of bullion. Quite a lot of bullion is on the dump, and considerable is shipped daily. The Frisco smelter has been running without interruption this month on the Bonanza ore, turning out about eight tons of bullion every twenty-four hours. They have a large amount of bullion on their dump. Bullion shipments for the last month were, by the Bonanza and Frisco smelters: 24 car loads, averaging 150 ounces in silver per ton, making about \$36,000. The amount remaining on the dumps on April 1st was about 18 car-loads, averaging 176 ounces, making \$30,680. The Germania reduction works about to be erected by Chris Herreck & Sparoubold (leaching) have struck water at a depth of fifteen feet, and are continuing to sink. They expect to be in running order about the 1st of May.

THE JENNY POWERS.—*Salt Lake Tribune*, April 19: A large and rich body of ore has been developed in this mine, Park City. The vein matter is similar to that found in the Ontario at a like depth.

The Crimson Mammoth company have recently made several very big strikes, and the owners are contemplating the erection of a 40-stamp mill.

BINGHAM.—A good deal of ore has accumulated on the dumps, yet but little, owing to the bad weather, has been reduced or marketed. Much attention is being paid to the leaching process here, which seems adapted to many of the ores. Some of the ores are rich and some poor, being both gold and silver bearing.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

ORIENTAL M. Co.—April 18th. Location, Arizona. Capital stock, \$2,500,000. Directors—August F. Kantz, S. Wilhelm, F. A. Whitney, W. L. Newlands, James Newlands, J. Y. Plume.

BEAR BUTTE CON. M. Co.—April 18th. Capital stock, \$10,000,000. Directors—A. Hildebrand, J. H. O'Brien, H. H. Barling, H. E. McBride, J. Van Orden.

ST. GEORGE G. M. Co.—April 18th. Capital stock, \$2,000,000. Directors—A. W. Rose, Jr., S. Heydenfeldt, Charles E. Scott, Geo. W. Dodge, W. Hussey.

ANDIE G. & S. M. Co.—April 25th. Capital stock, \$10,000,000. Directors—C. H. Leavitt, Frank Coy, J. W. Holmes, C. J. Platt and Joseph Leggett.

COCOS ISLAND MINERAL, METALS AND MINING Co.—April 25th. Capital stock, \$3,000,000. Directors—Wm. Cooper, B. J. Hull, P. S. Hibberd, John Dryner and W. G. Schofield.

WILLIAM RUBY S. M. Co.—April 25th. Capital stock, \$10,000,000. Directors—G. H. Willard, Edwin Lewis, E. O. F. Hastings, Charles Kaufman and R. N. Van Brant.

News in Brief.

THERE were 93 deaths in San Francisco last week.

THE Pope will not quit the Vatican during this summer.

ABOUT 20 persons were killed in Texas by the recent Indian raid.

THE communists of Chicago are said to be buying arms in New York.

THE Wenban mine, Cortez district, Nevada, is turning out bullion at the rate of \$12,000 per day.

A RICH ore discovery is reported to have been made at Yankee Blade, three miles from Austin, Nevada.

NEARLY all the peaches in Siskiyou county were killed by the frosts and cold weather of last week.

THE International Telegraphic Congress, announced for July next in London, has been postponed for one year.

At a fire in Coburg, Ontario, lately, a wall fell in, burying a number of firemen in the ruins, four of whom were killed.

THE conditions imposed on Nicaragua by the German Government have all been scrupulously fulfilled.

REPORTS from the grain-growing districts of Oregon indicate an unusually large crop this season.

THE Pacific coast delegation in Congress are unanimous in opposition to the proposed revival of the Presidential contest.

THREE distinct shocks of earthquake were felt at Glendale, on the Yellowstone river, on the 15th ult.

GEORGE V. COLLINS, foreman of the Alta mine, Washoe, fell 300 feet in a shaft, and was dashed to fragments.

It is reported that Secretary Sherman is about calling in for redemption 10,000,000 of the five-twenty six per cent. bonds.

MOST foreigners who go to Guatemala remain there, never being able to earn money enough to get away.

CONGRESSMAN VANCE, of Ohio, has reached his home from San Francisco, and is now thought to be insane.

GERMANY, with a view to increasing her revenues, will tax home-grown tobacco, to the culture of which some 75,000 acres are devoted.

THE *Tribune* says the Hon. Beverly Douglas habitually goes into the House of Representatives armed as well as drunk.

ENGLAND has a good standing army. "And the stiller it stands," says the Czar, "the better it will be for it."

THE sales in the San Francisco Board, for the week ending April 23d aggregated \$1,780,000.

THE schooner *General Miller*, is undergoing refitting, and will be ready for sea about May 12th, when she will sail on a fishing voyage.

THE American section of the Paris Exhibition is filling rapidly, and it is thought it will be little, if any, behind the others on the opening day, May 1st.

HANS JENSEN, a Dane, committed suicide at San Diego, by shooting himself through the head. He was a laboring man, 40 years of age and much respected.

THE cherry crop is likely to be large. The first box of the season reached San Francisco on the 18th, of April. It came from Briggs' orchard near Marysville.

WALTER YOUNG, barkeeper, was garroted a few nights since on the corner of Van Ness avenue and Jackson street, and brutally beaten because he carried no money.

JOHN GAMAGE both shot and stabbed A. J. Le Breton, a lawyer, in San Francisco last week. The wounds are serious. Le Breton is accused of shamefully abusing the confidence of the sister of Gamage.

THE Workmen of Gilroy have adopted resolutions opposing the formation of military companies or vigilance committees for political purposes, and condemning the use of incendiary or communistic language.

THREE THOUSAND miners have met at Uddington, Scotland, and resolved to demand an advance of a shilling per day from the masters of all Scotch collieries, and if refused, to strike work on the 2d of May.

THE stamp of the Union Boot and Shoemakers is being distributed to retail dealers, who before receiving it are required to execute a bond in the sum of \$2,000 that the stamp would be used on none but goods manufactured wholly by white labor.

WM. H. VANDERBILT has gone to Europe. Many rumors are in circulation as to the object of his visit abroad, one being that he proposes to arrange for a new steamship line to be run in alliance with the Central road. Mr. Vanderbilt, however, says that his trip is one of recreation.

THE gross earnings of the Central Pacific railroad for the first three months of the year were \$3,323,400, against \$3,361,200 in the corresponding period last year. It is almost certain that the earnings this year will be greater than in 1877.

ALL of the wheat vessels which sailed hence prior to January 1st have arrived out with the exception of three, none of which are fully due. There are now 40 vessels en route from California to England with wheat.

WORK has been actively resumed on the Sheba mine, in Humboldt county, Nevada, and on which very little had been done for many years. Some 12 or 14 years ago a large quantity of extremely rich ore was taken from this mine, the ore body finally giving out, or being lost through a "fault" in the ledge.

THE talked-of fusion of the Republican and Democratic parties for choosing delegates to the Constitutional Convention is likely to prove a failure.

A BILL has been introduced in the Ohio Legislature providing for the abolition of high schools and of instruction in languages in the lower grades.

THE reading room for young women, started in this city under the auspices of the Young Women's Christian Association, is a marked success.

THE rainfall for the season has been, at Grass Valley, Nevada county, 52 inches; in the more northwesterly parts of the State from 60 to 95 inches have fallen.

JOHN RUNK was hanged in this city on Friday of last week. The knot was arranged in such a hanging manner that his neck failed to be broken, and he died from strangulation.

THE Secretary of the Treasury directs that all medical officers of marine hospital service make use of the metric system of weights and measures.

THE prize fight between Joe Hearn and Tom Haverly, occurred in a barn in Brooklyn, N. Y. The latter was beaten and probably fatally injured.

A WOMAN caught the high French heels of her shoes in a railroad track near Meriden, Minn., and was held fast while a train cut off her legs. Moral: Railroads should be abolished.

JUNCE PENNIE has decided that unless a copy of the act which gives landlords a lien on the baggage of their guests for rent due is posted on the doors of their rooms they cannot legally seize anything.

As a means of settling the Mormon question, it has been suggested that Utah be annexed to Nevada—a plan that might prove effectual if that State would consent to such an enlargement of her boundaries as would take in her polygamous neighbor.

It is proposed, by a company formed for the purpose, to build extensive floating sea baths at North Beach, the house to have the form of a flatboat, 340 feet by 100, the establishment to be fitted up in the best style throughout.

SILVER REEF.—Concerning this town the business center of an extensive and flourishing mining district in southwestern Utah, a correspondent of *Pioche Record* writes as follows: Silver Reef is pleasantly situated, with a stream of good mountain water flowing through it. Bonanza City is the next town of size and consequence in the district. It is about a quarter of a mile from Silver Reef. There are five quartz mills running in this district, and all are doing the best of work. Two of these mills—the Christy, superintended by Captain Lubbock, and the Barbee mill—are in Silver Reef. The last named mill is within fifty feet of the mine which ore it crushes. The Leeds Company's mill and mine are situated about one and a half miles from Silver Reef, and at present is the "boss" mine of the district. The mill is located about a quarter of a mile from the mine. The Riverside mill, a 10-stamper, is situated about six miles from here, on the banks of the Rio Virgin, and is run by water power, thus making a great saving in fuel. There are quite a number of leachers in operation in this district, and I believe the process is a success, as the ore is sandstone and easy to crush. This district has, according to the best of information, about 1,000 inhabitants, and I believe fully 800 of them are from Pioche and vicinity.

TURKISH DISREGARD OF THE LAWS OF HEALTH.—It is a mystery that the inhabitants of the Ottoman Empire did not all perish years ago from pulmonary diseases. Their feet are first swathed in a coarse rag, which is then wound round the lower part of the leg and bound tightly with twine; on the rag is tied a piece of sole leather hammered into a rudely-shaped sandal, with the sides rising one inch up the sides of the foot; holes are cut in the upper edges of the sandals and strings tied in them, and then fastened over the top of the foot. It is evident that their feet are wet the moment they step into mud or water over an inch in depth. This they are doing constantly in bad weather; consequently, their feet are soaking wet for a week at a stretch, and yet they live and multiply. They violate every known law of hygiene in the ventilation and often in the cleanliness of their dwellings, and yet their children are generally sturdy-looking, and the adults show fair average physique. They sleep in rows on a mat laid on the floor of their underground huts. Sometimes the floor is covered with them, and yet they do not appear to suffer for want of oxygen.

THE ENGINEER.

Railways of the World.

Messrs. A. Chaux & Cie., of Paris, have published the following approximate statement of the railway lines open throughout the world in 1876, which we glean from *Iron*. In Europe the number of miles open was:

	Miles.		Miles.
Austria.....	10,768	Italy.....	4,767
Belgium.....	2,169	Portugal.....	591
Denmark.....	781	Roumania.....	764
France.....	13,390	Russia.....	12,121
Germany.....	17,333	Sweden and Norway.....	2,769
Great Britain.....	16,659	Switzerland.....	1,200
Greece.....	7	Turkey (in Europe).....	1,200
Holland.....	1,174		
Total.....			89,129

In Asia as follows:

Caucasus.....	622	Japan.....	38
Ceylon.....	82	Java.....	102
India.....	6,475	Turkey (in Asia).....	249
Total.....			7,628

In Africa as follows:

Algeria.....	383	Mauritius.....	66
Cape of Good Hope.....	65	Natal.....	2
Egypt.....	947	Tunis.....	37
Total.....			1,450

In North America, Central America and West Indies, as follows:

Canada.....	4,697	Jamaica.....	27
Costa Rica.....	29	Mexico.....	38
Cuba.....	397	United States.....	73,508
Honduras.....	60		
Total.....			78,166

In South America, as follows:

Argentina Republic.....	982	Paraguay.....	45
Bolivia.....	59	Peru.....	960
Brazil.....	830	Uruguay.....	189
Chile.....	614	Venezuela.....	8
Colombia.....	66		
Total.....			3,753

In Australasia, as follows:

New South Wales.....	405	Tasmania.....	45
New Zealand.....	238	Victoria.....	562
Queensland.....	263	West Australia.....	40
South Australia.....	196		
Total.....			1,748

Aggregate total, 181,864 miles of railway open.

The miles of railway for every 100,000 people in the respective countries is reduced by the following tabulation.

United States.....	163	Sweden and Norway.....	24
Canada.....	139	Denmark.....	24
Uruguay.....	109	Paraguay.....	23
Costa Rica.....	70	Spain.....	21
Argentina Republic.....	64	Brazil.....	18
Great Britain.....	50	Honduras.....	17
Chile.....	49	Italy.....	16
Belgium.....	41	Russia.....	14
Switzerland.....	33	Mexico.....	6
Germany.....	32	Jamaica.....	5
Peru.....	32	Bolivia.....	4
France.....	31	Colombia.....	2
Cuba.....	28	Venezuela.....	2

MAKING BERLIN A SEAPORT.—Dr. Strousberg, the great German railway contractor, proposes to make Berlin a seaport by connecting it with the Baltic and German oceans. There is everything in the nature and configuration of the soil to assist the rapid and effectual construction of deep sea canals between Berlin and the mouth of the Elbe, and between Berlin and the mouth of the Oder. There are only a few locks needed to regulate the influx of insignificant tributaries. What is more important, the scheme, according to the calculations added, promises to be profitable enough to encourage its originator to offer to carry it through without any assistance or guarantee on the part of the government. If only half the ordinary number of vessels plying between the North sea and the Baltic prefer the towage way through the canal, the capital, fixed at about £8,000,000 sterling, will, it is stated, bear an interest of 10%. Considering the immense importance of the scheme from a military, political, commercial, and industrial point of view, it is certain to attract attention. If the plan could be realized, Berlin would be raised to the position of a dominant commercial, manufacturing and military center of the continent.

THE ROUTE VIA THE MISSISSIPPI.—The movement of grain down the Mississippi and thence, through the jetties, to Europe, has assumed some importance, and a very considerable part of the grain shipped by rail from Kansas and Nebraska has gone to St. Louis with the Southern route in view. Whither this route will be practicable in summer and in winter, and whether vessels sailing from New Orleans can secure return cargoes so as to make their trips profitable are questions soon to be settled by actual experience. The feasibility of the movement certainly is likely to be thoroughly tested. The Illinois Central Railroad Company is also making a strong effort to divert a portion of the grain trade to New Orleans, and it is understood offers the same rate to that point as is charged to New York, and has made an arrangement with a steamship line for freightage to Liverpool at the same rate from New Orleans as from New York.

IMPROVING THE MISSISSIPPI.—Under the River and Harbor bill now pending before Congress, the Mississippi river above the mouth of the Ohio gets \$964,500. The Missouri river is given a special appropriation of \$275,000; of this \$80,000 is for surveys. It is thought these amounts will be granted, and work will be commenced during the coming season.

Building a Chimney.

John Morrison, chemical engineer, lately delivered an address in England on chimneys and smoke, which is reported in *Iron*. We take therefrom a few considerations concerning the principles involved in chimney building:

A chimney is one of those appliances where the conditions are too peculiar to admit of purely theoretical formulae. It must be designed chiefly by the aid and under the auspices of practical experience. For it must be observed that the case is not one simply of two equal columns of air of like weight, and in equilibrium when at equal temperatures; but one where half-a-dozen different gases, not to speak of unconsumed carbon and steam in variable and ever varying mixtures, are so many causes (any of them sufficiently disturbing) to hopelessly vitiate the results of any merely thermal calculation. I have always in chimneys advocated ample area, for excess of draft is easily checked, but shortness of the same is a great nuisance. For good furnace work indeed a rapid draft is absolutely essential, and is in reality far more economical than a sluggish one. I do not, however, believe in very large chimneys, communicating with a perfect net-work of

most efficient way of working. A chimney draft necessarily implies considerable heat waste, the waste increasing proportionately to the augmentation of the velocity; and in the case of reverberatory furnaces, where the temperature is very high, and the duty on the coal consumed very low, perhaps a properly constructed centrifugal apparatus might in some cases secure the object with a higher degree of economy than is at present practicable. Its leading advantage would be the greater facility for utilizing the spent heat of the furnace to which it might be attached, for evaporative and other purposes. This is now only to a trivial extent feasible without serious retardation of the draft. Of the extent, however, of the present heat waste, many people have, I believe, very false notions. Gases of a lower temperature than 500° Fah., it is usually—though not as a rule without an exception—far more economical to send quietly up the chimney, than to persist in devising schemes for their utilization. I do not think they are of any practical value, excepting, perhaps, for such insignificant work as crystal drying.

ST. PAUL AND PACIFIC.—Press dispatches from St. Paul say, that Messrs. Hill & Rice, representing the new owners of the St. Paul and Pacific railroad, report the transfer of the

FOSSIL PASSARINE BIRD, FOUND IN COLORADO.

flues. I think the best results are gained in those of an internal width at the summit of from 6 feet to 10 feet, and of a height equal to from 16 to 20 internal diameters. All furnaces do not of course require the same chimney capacity. Those whose fireplaces are very deep, and whose doors are frequently open, naturally require a more powerful draft than those whose doors are usually closed, and whose fireplaces are shallow. It makes an immense difference in the draft efficiency when, instead of being allowed to rush right ahead to the main flue, the products of combustion are made to return over the furnace arch or under the bed; and in the case of boiler fires especially, a good deal hinges upon the character of the coal. Some coal will cake and huru splendidly, with precisely the same amount of damper with which others will only burn to a loose cinder. It is of course manifest that the power of a chimney is diminished by the "pull" on the draft, that is to say, by the resistance to be overcome in drawing air through the fuel in the furnaces. So long as one of the most important duties of a chimney is the conveyance to such an altitude, as shall insure the proper diffusion or dispersion—before their external re-descent—of all fumes and noxious vapors, that useful and simple appliance will probably retain its present economic position. Were it merely for the creation of a draft, possibly it would not be the

bond-holding interest from the Dutch holders to Canada and Minnesota parties completed. The new proprietors have obtained a majority of the bonds on favorable terms, which will place them in possession of the road within six months after foreclosure, which will take place in June, at a cost of not more than \$10,000 in gold per mile. They expect that cars will be running from St. Paul to Winnipeg, in Manitoba, by November. The work to be done will embrace the completion of the branch line from Melrose, Starns county, to Alexandria, Douglas county, and the extension of the line from Crookston to St. Vincent, where connection will be made with the Canada Pacific.

STREET RAILROADS IN NEW YORK.—The receipts of the horse railways of New York city are said to reach nearly \$200,000 per week, the fares being 5 and 6 cents, and the number of passengers carried averages over half a million per day. The grand system of elevated roads now being pushed forward will afford vast improvement over the present crawling vehicles, and with fares at 10 cents ought to prove very profitable. The Third avenue elevated road, it is said, will run every minute trains of five cars, each holding 60 passengers; so that it can transport 18,000 passengers per hour.

A Remarkable Fossil Bird.

Heretofore Europe has led us in the discovery of fossil remains of the higher types of birds, but now, through the researches of Prof. Haydeu's survey, a locality has been found in the insect-bearing shales of Colorado, which bids fair to furnish our naturalists native material of a high order for their studies in the rock-written chapters of natural history. The highest type of extinct birds heretofore found in this country is a Picarian bird (*Urodon lucaris*), related to the woodpeckers. This fossil was described by Prof. Marsh, and was from the lower tertiary of Wyoming territory.

The engraving on this page presents a matter which is therefore new to the scientific records of our country. It is from advance sheets of a Bulletin just issued by the U. S. Geological Survey, and scores another good point for Prof. Haydeu's scientific investigators. The discoverer of the fossils from which the drawing is made was Mr. S. H. Scudder. The fortunate discovery is described by Prof. J. A. Allen, well-known as an ornithologist. He gives the new found bird a new genus and new species, and calls it *Paleoscoptes Bella*. The description of the species is based on some beautifully preserved remains from the insect-bearing shales of Florissant, Colorado. They consist of the greater part of a skeleton, embracing all of the bones of the anterior and posterior extremities (excepting the femora). Unfortunately, the bill and the anterior portion of the head are wanting, but the outlines of the remainder of the head and of the neck are distinctly traceable. The bones are all *in situ*, and indicate beyond question a high ornithic type, probably referable to the Oscine division of the *Passeres*. The specimen bears also remarkably distinct impressions of the wings and tail, indicating not only the general form of these parts, but even the shafts and barbs of the feathers.

In size and in general proportions, the present species differs little from the Scarlet Tanager (*Pyranga rubra*) or the Cedar-bird (*Ampelis cedrorum*). The bones of the wings, as well as the wings themselves, indicate a similar alar development, but the tarsi and feet are rather smaller and weaker; and hence in this point the agreement is better with the short-legged Pewees (genus *Contopus*). These features indicate arboreal habits and well-developed powers of flight. The absence of the bill renders it impossible to assign the species to any particular family, but the fossil on the whole gives the impression of Fringilline affinities.

The bones still rest in the original matrix, and, being somewhat crushed and flattened, do not admit of detailed description and comparison with other types. The furculum is well preserved, and the limb-bones are all in place in their natural relation. The sternum is unrecognizable. The position of the cervical series of vertebrae and the general outline of the skull can be traced; but no structural characters of the head can be distinguished, except the proximal portion of the mandible. The long bones all present a well-marked longitudinal groove, due evidently to compression and fracture. This groove is distinctly traceable, even in such slender bones as tibiae, tarsi, and clavicles. In point of size, while the furculum and the bones of the wing have all about the same length as the corresponding parts in *Ampelis cedrorum*, they apparently are considerably stouter. Their greater breadth may, however, be due simply to flattening from pressure. The tibiae and tarsi are shorter than in the species last named, but the difference is slight.

The most remarkable feature of the specimen is the definiteness of the feather impressions. Both the shafts and the barbs are shown with great distinctness in the rectrices, and the tips of the primaries of one wing are also sharply defined, overlying the edge of the partly expanded tail. The tip of the opposite wing can also be seen beneath the tail. The feet are so beautifully preserved that even the claws are perfectly distinct, as shown in the engraving.

The specimen is divided into an upper and a lower half, the greater part, however, adhering to the lower slab. The bones adhere about equally to the two faces. The drawing is made from the lower slab, with some of the details filled in from the upper one.

MONTANA'S PROSPECTS.—Montana never had so bright an outlook as she has at the present time. Her citizens, as a class, are in better financial circumstances than they have ever been, and unless all signs fail, they are on the road to prosperity. The winter has been a peculiarly favorable one for stock, and has enabled prospectors and quartz miners to do much work that could not have been done had the winter been as severe as usual, and this labor has resulted in most instances in developments of a favorable character.—*Helena Independent*.

KEEPING THE MONEY AT HOME.—The Boston Journal says: A New York banker estimates that \$75,000,000 of our bonds held abroad have been returned and sold in the United States during the last four or four and a half months. If this be true, the country may be considered richer by that amount, and that the four or four and a half millions of coin sent out of the country to pay the interest will hereafter be retained at home.

TWENTY THOUSAND tons of lead were produced in Nevada last year—nearly one-third of the total production of the United States.

Origin of Lakes.

Prof. Ramsay, F. R. S., Director-General of the Geological Survey, in a recent lecture at the London Institute on "The Great Ice Age," commenced with a description of a typical Swiss glacier, drawing special attention to that which is commonly called the perpetual snow line, here some 8,500 feet above the sea level, which is called perpetual rather by courtesy than as being an absolute fact. While it is the snow which furnishes the mass of the glacier, the fragments of rock carried down originate in this way: There are some deep slopes which are not covered with snow and are exposed to the heat of the sun. The alternating heat during the day and the cold of the night causes disintegration, and masses of rocks are broken off, which not only form the heap of rubbish called moraines, but some of which, falling through the crevasses, form the "graving tools" which score the mass of rock beneath into grooves. If we look further afield we find glaciers in the Himalayas, in Greenland and in Victoria Land, which make those of Switzerland appear quite insignificant. In Victoria Land the sheets of ice which float off are of enormous thickness and indicate through what a severe glacial period the Southern hemisphere is passing. The chief signs by which the former existence of glaciers in places where they no longer flow can be traced are the old moraines and scratchings on the rocks. Taking these as guides, the eye of a trained glacialist can detect with certainty the traces of long-departed glaciers in many parts of the world. The well-known examples in Wales were first mentioned, and then in succession those of Scotland and North England were described. There is evidence in Scotland that in former times the glaciers were so extensive that part flowed out through the Frith of Forth, part through the Frith of Clyde, and part over the table-land of the Lammormoor hills. Cumberland at one time was smothered in glacier ice. The glaciation of Anglesea was the result of a different system from the glaciers of Wales, as is proved by the fact that the striations of the rocks lie in different directions. The Scandinavian mountain chain has been unmistakably molded by glacier action, and there are abundant evidences that North America has been intensely glaciated. These facts had been noted by many observers, but there was a point in connection with this which Prof. Ramsay said he claimed as his own idea, and that was with regard to the origin of lake basins. His belief is that in all cases they have originated from glaciers—that is, that the basins have been scooped out by glaciers. He pointed, in confirmation of his position, to cases in many parts of the world where there are like basins near mountain chains which could have furnished glaciers, and that lakes are absent where there are no high chains. He did not, however, say that there were not some which had originated from other causes. The lecture was illustrated by diagrams and water-color drawings.

Idaho Salmon River Mines.

A correspondent writing to the Salt Lake Tribune about these mines remarks as follows: From the point where the Salmon river enters the southwest corner of Lemhi county, Idaho, it hears east for about 140 miles, then north 50 miles, after which it bends around to the west and runs in that direction till it enters Snake river, enclosing a region of country of horseshoe form, which promises, when developed, to rival any mineral district on the continent. From the southeast point of this horseshoe, rising between Salmon City on its south and Leesburg on the north side, extends in a northwesterly direction towards the head of Yankee Fork, a mountain ridge, the chief depository of valuable ore. Entering the plateau south of this ridge, the entire slope of these mountains remains continually in full view. It is covered with a park-like forest of pines, stretching away to the right and left, which promises an abundance of fuel for many years to come. The plateau, as well as the mountains, are covered thickly with grass, and many small creeks leave the mountains on this side, wending their way through canyons getting deeper and deeper towards Salmon river.

Five years ago mineral was first discovered in these mountains; it was gold, occurring in small veins, but the ore was very rich.

They seem to occupy fissures, though not enough exploratory work has yet been done to determine this point fully. The mineral occurs in three different classes of lodes, one carrying gold almost exclusively; the second, both gold and silver ore, and the third only silver. The bearing of these lodes ranges from east and west to northeast and southeast. They all dip north, carry much water and are exceedingly well defined. The mineral bearing gangue is quartz, and the width of the ore veins generally varies from 12 to 36 inches. Besides the quartz there is more or less decomposed gangue matter closely resembling the granite which forms the country rock.

These veins are numerous, but require to be opened, no work of consequence having been done here for a long time. Only recently has a wagon road been built into this region, everything before having been packed over rough mountain trails. The country abounds with fine timber, good soil, water and pasturage, and invites capital and immigration.

USEFUL INFORMATION.

A New Mailing Box for Microscopic Slides.

A new style of mailing box, contrived by Dr. R. H. Ward, editor of the Microscopical department of the *American Naturalist*, has been adopted by the Postal Club, and has proved successful beyond anything tried before. An account of it has been published in the *American Naturalist*, and we reproduce it in the hope that it may be of use to some of our readers. Whether it can be used or not will depend upon the Government decision on the point whether anything containing glass shall be allowed to go through the mails:

"In the boxes hitherto used for posting slides, the slides are occasionally found shattered to pieces, while the box containing them is quite uninjured, or only a little strained. In some boxes containing six or twelve slides, half or more of the slides have been found broken in a perfectly sound box. This seemed to indicate, not the effect of a crushing blow, but the result of the inertia of the slide itself, which was only supported by the wooden racks at the ends, and more or less perfectly by the cotton stuffed around it. An adequate occasion for such an accident might be furnished by throwing a mail-bag from a wagon to the pavement, or transferring it to or from a rapidly-moving train. It was therefore decided to reject the wooden rack altogether, and instead to support the slide by the whole of its edges and much of its sides by cloth, leather, india-rubber, or other soft and evenly-yielding material. This may be attained with the common boxes by removing the rack, lining the top, bottom and end with thick, soft cloth, and arranging folds of the cloth, glued or stitched in place, like a rack at each end of the box, so that a double thickness of the cloth shall extend between the slides from each end one inch towards the center. It is better, however, to have the boxes made for this use somewhat larger than the customary size, so that very thick beaver cloth can be used for the packing. For six slides, a box may be made of hard wood 3-16ths of an inch thick, 3 3/4 inches long, 1 1/4 wide, and 1 1/2 deep, inside measurement. The folds of cloth should be so arranged that not more than an inch in the center of the slide is unsupported, except when large cover-glasses are to be used, when more space should be left to avoid pressing on the cover. The outside of the box is covered with strong thin cloth.

"The comparative safety of this method is indicated by the experience of the Postal Club. During a trial of several months in many of the circuits, not one slide is known to have been broken while packed in this manner, while to slides in the ordinary boxes with wooden racks accidents are unfortunately frequent. For sending by express, these boxes should be made of thicker wood, or enclosed in larger cases, to prevent crushing by the weight of heavy packages among which they may be carried."

INTEREST.—"An American Almanac and Treasury of Facts," by A. R. Spofford, Librarian of Congress, contains much that is valuable for reference. We extract a few lines which express very forcibly the accumulation of interest at low and high rates: "One of the causes of bankruptcy is that so few persons properly estimate the difference between a high and low rate of interest, and therefore often borrow money at a ruinous rate that no legitimate business can stand. Very few have figured out the difference between 6% and 8%. One dollar loaned for 100 years, at 6%, with the interest collected annually and added to the principal, will amount to \$340. At 8% it amounts to \$2,203, or nearly seven times as much. At 3%, the usual rate of interest in England, it amounts to \$19.25; whereas at 10%, which has been a very common rate in the United States, it is \$13,809, or about 700 times as much. At 12% it amounts to \$84,075, or more than 4,000 times as much. At 18% it amounts to \$15,145,007. At 24%, which we sometimes hear talked of, it reaches the enormous sum of \$2,551,799,404. One hundred dollars borrowed at 6%, with the interest compounded annually, will amount to \$1,842 in 50 years, while the same \$100 borrowed at 8% will amount to \$4,690 in 50 years. One thousand dollars at 10%, compounded, will run up to \$117,390 in 50 years."

A NOVEL USE OF THE TELEGRAPH.—The electric wire has been pressed into a strange service by the Norwegian government. As is well known, the herring fishery forms one of the most important sources of income for the country, the captures being made as the great shoals come from the depths of the sea to deposit their spawn in the Norwegian fiords. It frequently happens that the object of their visit is accomplished and they return to the ocean before news of their arrival reaches the fishers on distant parts of the coast. This difficulty is now obviated by the construction of a telegraphic line of 200 kilometers in length, composed chiefly of submarine cables, by means of which the fishers along the whole coast are enabled to concentrate on the approach of a shoal at any particular fiord. The abundant captures made in this way show the investment in telegraphic wire to have been a most profitable speculation.

CLEANING OLD ENGRAVINGS.—An admirer of old engravings adopts the following plan for cleaning them: "I place them, one or two at a time, in a shallow dish and pour water over them until they are completely soaked or saturated with it. I then carefully pour off the water and pour on to the prints a solution of chloride of lime (one part liq. calcei chlorate, B. P., to 39 parts of water). As a general rule the stains disappear as if by magic, but occasionally they are obstinate. When that is the case, I pour on the spot pure liq. calcei chlorate, and if that does not succeed, I add a little acid nitro-hydrochlor. dil. I have never had a print which has not succumbed to this treatment—in fact, as a rule, they become too white. As soon as they are clean, they must be carefully washed with successive portions of water, until the whole of the chlorine is got rid of. They should then be placed in a very weak solution of isinglass or glue, and many collectors color this solution with coffee grounds, etc., to give a yellow tint to the print. They should be dried between folds of blotting paper, either in a press or under a heavy book, and finally ironed with an ordinary flat iron to restore the gloss, etc., (place clean paper between the iron and the print).

THE BEST METHOD OF ARRESTING FIRES.—On the first discovery of a fire, it is of the utmost consequence to shut, and keep shut, all doors, windows or other openings. If the fire appears at all serious, and there are fire engines at a reasonable distance, it is best to await their arrival, as many buildings have been lost from opening the doors, and attempting to extinguish the fires with inadequate means. If no engines are within reach, it is well to keep a hand-pump. If that is not to be had, the next best thing is to collect as many buckets outside the room on fire as can be obtained, keeping the door shut; then creep into the room on the hands and knees (if the heat and smoke are considerable), and throw the water as nearly in the direction of the fire as possible, keeping the door shut while more water is being collected. The police of London understand shutting up fires so well, that they have in many instances kept fires two or three miles distant from the engine stations shut up till the firemen arrived in time to extinguish them.

CHESTNUT GLUE.—Glue from chestnuts is made as follows: Free the chestnut from the brown crust, grind the kernel into flour, mix and mash it up well with water and pass it through a sieve, in which the woody fibers are retained; then wash the fine floury mass so obtained with clear water several times and let it carefully settle. The sediment or starch thus deposited is dried in the air; then again treated with chlorine water, washed again and made into glue in the same manner as glue is made from starch. The advantage of this glue for all industrial purposes is that it will retain its liquid state and power even at a cold temperature without any fire, while with the common glue it is necessary to have a constant fire in order to keep it in a liquid state.

GOOD HEALTH.

Longevity.

The London *Capital and Labor* has an interesting article on the above subject, which will be read with interest. It says: "Medical writers who have given considerable attention to the subject of vital statistics, have arrived at the somewhat extraordinary result that the higher the social grade, and the greater the means of personal indulgence, the smaller are the chances of long life. Many people accustom themselves to consider the possession of wealth an effectual guarantee for a flourishing condition of body. Such persons will be surprised to learn that in proportion as the wholesome stimulus of work is withdrawn from any class, in the same proportion the average duration of life is shortened. A little reflection, however, will serve to show the reasonableness of such a conclusion. Many a man who has passed a somewhat active career during a prolonged period suddenly retires from business, with the notion that he has only to rest for the remainder of his life, and that he now may enjoy himself. In the generality of cases the most effectual method is thereby taken to shorten life. Having nothing to occupy the mind, and being unable to take up any pursuit different from that which has chiefly been followed, the retired tradesman or manufacturer speedily falls into a physical and mental condition favorable to disease. The only chance for such a person is to discover some new employment or recreation which shall insure activity of both mind and body. There was much practical wisdom in the story told of the tall chandler who, in disposing of his business, is said to have made a stipulation 'that he should be allowed to go to the shop on hoiling days.' None of us are able to hear a prolonged fit of idleness, and least of all those who have been in the habit of regular industry. It is a well-known fact that regular living and sobriety, and a proper degree of activity for the mind as well as for the body, are essential to good health and to the right discharge of all the vital functions. While, on the other hand, luxury, indulgence and sloth are the cankers of life."

EGGS AS FOOD.—Eggs of various kinds are largely used as food for man, and it is scarcely possible to exaggerate their value in this capacity, so simple and convenient are they in their form and so manifold may be their transformations. They are exceedingly delicious, highly nutritious and easy of digestion, and when the shell is included they may be said to contain in themselves all that is required for the construction of the body. It has been claimed for them that they may be served in about 600 ways, although it is generally found the more simple they are prepared the more they are approved. Although other eggs than those of birds are eaten, for instance, turtle's eggs—it is generally agreed that the eggs of the common fowl and of the plover possess the richest and sweetest flavor. The eggs of ducks and geese are frequently used in cookery, but they are of too coarse a nature to be eaten alone. The eggs of the turkey and of the pea-hen are highly esteemed for some purposes. The weight of an ordinary new-laid hen's egg is from one and a half to two and a half ounces avoirdupois, and the quantity of dry solid matter contained in it amounts to about 200 grains. In 100 parts, about 10 parts consist of shell, 60 of white and 30 of yolk. The white of the egg contains a larger proportion of water than the yolk. It contains no fatty matter, but consists chiefly of albumen in a dissolved state. All fatty matters of the egg are accumulated in the yolk, which consists relatively of a smaller proportion of nitrogenous matter and a larger proportion of solid matter than the white. Therefore, in an alimentary point of view, the white and the yolk differ considerably from each other, the former being mainly a simple solution of albumen, the latter being a solution of a modified form of albumen, together with a quantity of fat. . . . Raw and lightly-boiled eggs are easy of digestion. It is said that raw eggs are more easily digested than cooked ones; but this may be doubted if the egg is not over-cooked. A hard-boiled egg presents a decided resistance to gastric solution and a constipatory action on the bowels.—*Cassell's Domestic Dictionary*.

TAKING COLD.—The New York *Independent* says: How shall a person who is sensitive to cold, who takes cold whenever a door is opened or a window raised—how shall such a person acquire that hardihood which will enable him to endure exposure and avoid taking cold? In the first place, he should spend a considerable portion of each day out of doors. He should do this at all seasons of the year and in all kinds of weather. Secondly, he should watch with the greatest care the temperature of the room in which he spends the remainder of his time—both the living room and dormitory. Thirdly, he should each day bathe his chest and neck, and, if he can bear it, his whole body in cold water, and follow this with a vigorous rubbing with a coarse towel. What is called the splash-bath is, perhaps, better than any other for this purpose. It consists simply in dashing water against the body with the hand. This causes a slight shock to the skin, which brings the blood to the surface; while it causes an involuntary, deep inspiration of air, which expands the lungs and increases the force of the circulation. This can all be accomplished in a few minutes, and should be followed by a little brisk exercise in a cold room or in the open air. Of course, a person unaccustomed to this should not commence in cold weather; but, beginning in the summer, he will find, as the winter approaches, that his ability to endure the bath will increase with the falling of the thermometer, and that his susceptibility to changes of temperature will be greatly diminished.

COL. BELL'S COUGH MIXTURE.—While at Sacramento the other day, says the *Napa Reporter*, we were given the formula of a cough mixture by Col. Wm. H. Bell, Sergeant-at-Arms of the Senate, which we have tried and found most excellent. In fact we feel that we ought to recommend it to all suffering from severe coughs or lung troubles. Here is the formula: One ounce golden seal, one ounce myrrh, one ounce gum arabic, one ounce prickly ash, one ounce senna, one ounce seneca snake root (*cinicifuga*), one teaspoonful cayenne pepper. Put these in a vessel with half a gallon of water, and slowly boil or simmer three or four hours, until the strength has been extracted from the several ingredients. Reduce the quantity of liquid to a quart and strain off. Then add two sticks of licorice, a pint of whiskey and a pound of rock candy. The dose is a tablespoonful four or five times a day—one always at bed-time, and the first thing in the morning. The mixture is a gentle laxative, therefore be careful not to take enough to cause inconvenience in that way. Each person must learn to regulate the doses to his own particular case and idiosyncrasies.

CONSANGUINEOUS MARRIAGES.—Mr. George Darwin, after a searching investigation, concludes that "the widely different habits of life of men and women in civilized nations, especially among the upper classes, tend to counter-balance any evil from marriage between healthy closely related persons." Mr. Darwin's views are in a measure sustained by Dr. Vorn's inquiry into the commune of Batz. Batz is a rocky, secluded, ocean-washed peninsula of the Loire Inferieure, France, containing over 3,000 people of simple habits, who do not drink and commit no crime. For generations they have intermarried, but no cases have occurred of deaf-mutism, albinism, blindness, or malformation, and the number of children born is above the average.

MINING SCIENTIFIC PRESS

NEW ADVERTISEMENTS.
Pictet Artificial Ice Co., New York; Miners' and Builders' Horse-Power, J. B. Reynolds, 327 Market Street, S. F.; Quicksilver Condensers, Thos. W. Dresser, San Jose.

The Week.

The following incidents and events may be enumerated as amongst those which have most attracted public attention the past week: The decision of Judge Sawyer of the U. S. Circuit Court, that the Chinese are not a white race, and therefore ineligible to citizenship under the laws of the United States, an opinion in which the people of this coast very generally concur. Petitions, numerous signed by all classes of people, have been dispatched to Washington, asking Congress to allow the Southern Pacific Railroad Company to extend their road east through Arizona and New Mexico, continuing it on till it meets such other road as may be built westward on that line. A further improvement in business of most kinds has been manifested during the week, building in the city especially being more active. A better feeling in regard to real estate investments also begins to prevail, the amount of sales for April having been somewhat larger than for the preceding month, with some probability that they will continue to increase, money being now abundant at cheap rates of interest and the scare growing out of the labor movement having pretty much subsided.

The Fortunes of a Pioneer Mining District.

There is hardly a more memorable thoroughfare in the State than that leading out of Sacramento east through Folsom. Along this the pioneer immigrants to California pursued their way towards their first objective point, Sutter's Fort. By this route Fremont entered the country on his first expedition, and over it he advances gold seekers passed to the new El Dorado of the West. When Peter Wimmer brought to New Helvetia the first piece of gold found by Marshall and himself at Sutter's mill, he came this way, passing by Mormon island, Folsom and Alder creek, all of them afterwards noted mining localities. Gold washing was, in fact, commenced at Mormon island and the mill almost simultaneously. The discovery of rich virgin diggings at other points, and the partial exhaustion of these earliest finds, caused the latter, in process of events, to be nearly deserted, these places having for many years retained only such small modicum of settlers as were presumably deficient in enterprise, or too poor to get away. At a later period the population began to increase, many who had mined here at an early day, after trying their fortunes elsewhere, having returned, satisfied that these old diggings were a surer thing for small wages than the Comstock or other of the great vein mines that require much money for their development.

Between the few who remained and the many who have come back, these old camps have become again quite populous, exhibiting to-day as much activity and, in the aggregate, as much thrift as any other mining localities on the coast. In the district of which Folsom is the business center, gold mining is now being carried on to a very respectable extent, and by nearly all the diversified methods practiced in California. While drift digging, by means of shafts, is much in vogue, some surface, with a limited amount of hydraulic washing is also carried on in this neighborhood, water for steady use being supplied by the Natoma ditch, a good deal having been afforded here, as elsewhere, from free sources the present winter. In addition to the river bars, which were, of course, early exhausted, there has been a great area of shallow placers in this vicinity, but not until quite lately has this been noted as a quartz mining district, as, indeed, it was not supposed to contain ore deposits of any large value. Recently, however, discoveries have been made that promise to impart to it additional consequence by adding to its mineral resources this more profitable and permanent form of mining. Not only so, but the developments being made here raise the probability that these discoveries are on the great auriferous channel known as the Mother lode of California.

Crossing the country in a northerly and southerly direction, and showing itself most strongly at a point five miles southeast of Folsom, is a quartz belt, varying from 1,000 to 3,000 feet in width. This belt, like the Comstock, the Mother lode and all *Vetas madres*, carries three distinct and nearly parallel veins or ledges, an easterly, a westerly and a middle one. Locations were made on these several veins some time ago, but not until a few months since was much work done upon them. Ever since these claims were first taken up, small bunches of rich ore have been found at places along them, which encouraged the owners to hold on and in a few cases to do some prospecting work upon them, none of them going to a greater depth than 100 feet or a little more, the most of the work having been confined to near the surface.

Among the early locators on the westerly of this series of veins was Capt. J. Beck, an old resident of Folsom. On his location, called the Lost Quartz mine, a shaft had been sunk, but so near the line separating his from the adjoining claim, as to lead to some doubt as to which it was actually on. This gentleman having applied for a U. S. patent for this ground, the survey made in connection therewith shows this shaft to be on his claim and 24 feet from the boundary. After this point had been determined, exploratory work was resumed at this point, revealing a stratum of quartz, six feet thick, that mills from \$23 to \$25 per ton, or, in other words, a first-class gold mine, the bulk of this being a free ore that can be worked very close to fire assay by the most simple and inexpensive methods of reduction in use. The sulphurets that have been saved are exceedingly rich, assaying from \$500 to \$600 per ton. In the middle of this stratum runs a strip of decomposed quartz, 18 inches wide, that contains enough free gold to warrant its being washed in sluices, paying from 2c. to 10c. to the pan. In this streak there occur pockets of amazing richness, two pounds of this material, taken out a few days since and crushed in a hand mortar, having yielded no less than \$2,000 worth of fine gold. This decomposed quartz, after sluice washing, is milled and always pays largely. This shaft has been carried to a depth of 100 feet, at which level the ledge from six feet above has expanded to seven feet, being everywhere compact and unbroken, with smooth, regular walls, the lower composed of a talcose slate and the upper of porphyry. This claim has a linear extent of 1,500 feet, running with the ledge with a surface width of 300 feet on each side.

This strike has led to a general resumption of

work on the other quartz claims hers, besides starting prospecting afresh in the neighborhood. In the absence of means for putting up mills, claim owners have constructed arastras, a number of which are now running with such good results that more may soon be expected to follow, rendering this one of the most lively and prosperous camps in the county. Meantime, Capt. Beck has ordered, at one of our foundries, machinery for a five-stamp mill, which will be up and running in a very short time.

While new life has been infused into quartz operations by this important ore find, the several branches of placer mining hers pursued are active and steadily undergoing some expansion. Several hydraulic companies are washing in the neighborhood, with average success. A good many men make fair wages drifting on the old channel that passes through here and which can be reached by shafts of moderate depth, while not a few have done equally well this season washing in the shallow placers that are open to all and which will continue to pay as long as the free water lasts. Taking it altogether, there are probably few mining communities in the State that are enjoying a larger average share of prosperity than this about Folsom. If we were asked by an unemployed miner where he had best go to get work or start in for himself, we don't know but we would as soon recommend to him this ancient camp as any other. Right in this highway, along which immigration has surged for a third of a century; over which multitudinous thousands have come and gone; which was trod by the feet of the first gold finders and traversed by the pioneer railroad of the Pacific, the chances for one who wishes to mine in a sure and small way are about as good perhaps as in any other in California. As remarked in the last issue of the PRESS, the gold deposits of this State do indeed seem to expand under working, the developments in this article mentioned furnishing a case in point.

Montana Mining Interests.

We have received a brief intimation from some individual in Montana to the effect that the PRESS is apt to ignore mining matters in that part of the country, while it gives full details concerning other points on the coast. The person referred to is totally and entirely mistaken, and we are pretty certain he has never read the PRESS much or he would not have made any such assertion. Our "Mining Summary" is made up mainly of extracts from journals published in the immediate vicinity of the mines in the various localities, and we are careful to glean every item of interest which may be published. We sent a special correspondent to Montana last year and published from him a series of very interesting letters describing the various mines and districts in detail, and have also published whatever of interest from that section which we have been able to obtain from the local papers or from correspondents. The latter are, unfortunately, scarce, and we should feel very grateful to any persons who have interest enough in the part of the country in which they live, to send us a letter concerning it occasionally. It is hardly worth while for us to enumerate the various articles on Montana and its resources which we have published of late. Suffice it to say we have not omitted mention of that Territory whenever it was possible to obtain any items from there which would be of general interest. If the person who wrote to us on the margin of a paper will communicate with this office we shall feel obliged.

Our Editorial Rooms.

The editor thus publicly makes acknowledgment of the indebtedness which he and the readers of the PRESS owe to the publishers, for a complete renovation and refurnishing of our editorial rooms. We count the readers in the indebtedness, because we really think snowy walls, crystal windows, brightly painted woodwork, and cleanly covered floors, must tend to sharpen editorial points—whether they be of scissors, pencil or brain—and the result would be a fresher character to the matter which fills our columns. Whether this will indeed follow, the future only can tell. Our windows are clean, and now we are in sympathy with old Goethe in his cry for "more light." There is one point which may be of practical value to some of our readers who are contemplating improvements of their abodes or outbuildings. We have had opportunity to test the qualities of the Averill mixed paint by ocular demonstration, and we do not hesitate to praise it most highly. It has a body, a covering quality, and a beauty of finish which makes our simple woodwork look like slabs cut from the rosy morning. It speaks its own praise to all who see it.

FINE SPECIMEN.—We have received a very fine specimen of gold-bearing quartz from the Knox and Bell ledge, Grizzly gulch, near Whiskey town, Shasta county. The specimen was presented to us by Mr. Wm. Thompson, of Reading, and shows a handsome little nugget on one side of it, such as would gladden the eyes of any miner.

Exploiting the Pliocene Rivers.

Experience establishes that the policy of Californians going abroad to make mining investments, is one of doubtful expediency. As a general rule those who have kept nearest home have fared the best. There mingles with our hydraulic and drift operations, an element of certainty that is beginning to have its influence with the cautious capitalist and the prudent of all classes, and even our quartz mines have with these grown in favor of late. The success that has attended some of the drift operations in this State, is strongly attracting the attention of investors towards this class of claims, which, wherever they have been thoroughly opened and drained, have yielded magnificently. The field of exploitation here consists of the pliocene channels—the so called "dead rivers" that traverse in almost every direction the central and more northerly mining counties of California. Under the impression that there was but a single one of these streams, the first one discovered was denominated "The Blue Lead," this name having been given to it on account of the color of the lower and richer stratum of gravel it carried, and because it was then supposed to be a lead or lode of some kind of decomposed mineral substance, no one supposing it to be the channel of a buried river. Afterwards more of these channels were discovered, and their true characters ascertained; but even so late as 1868 only the main channels of these "dead rivers" had been traced, as may be seen by referring to Doolittle's map of central California, published in that year, and upon which all the channels up to that time recognized were accurately laid down. Since then many additional channels have been discovered, the most of them of lesser magnitude, being, probably, branches of the main streams, and also others, not so broad or deep-lying, having been formed, perhaps, at a later date.

On the main streams have been situated the diggings that have gained for these pliocene rivers their fame as gold producers, and which, extending from Plumas to Mariposa, have fully sustained for more than a quarter of a century, their ancient and well deserved renown. From them came the wealth that has distinguished a hundred camps along the great California gold belt, their erosion having been, in fact, the principal source of enrichment to all our modern streams.

At first these ancient channels were exploited wholly by tunneling, this method being still in use where natural facilities favor its adoption. In the absence of these it is not, however, always practicable. In these cases recourse must be had to the perpendicular shaft, which, where there is not much water to hoist, answers almost equally well, while it is in the first instance much cheaper, their construction costing on an average not one-quarter as much as tunnels. Latterly the employment of shafts has been much resorted to, the sinking of a considerable number of these being now in progress. The most noted structures of this kind are located in the vicinity of Forest City, and along Slate creek in Sierra county; about Nevada City; on the Forest hill divide, in Placer county, and near Folsom, in Sacramento county, there being great numbers of them scattered over the mining regions elsewhere. At Forest City they have to sink to considerable depths to reach the rich pay stratum, which always lies at the bottom of the channel. The Pliocene company, putting down a shaft in that neighborhood, have already sunk a distance of 200 feet, and will probably have to go 50 or 75 further. About Folsom, on the contrary, the shafts do not average more than a quarter of this depth, while around Todd's valley, on the Forest hill divide, a depth of less than a hundred feet suffices to reach the old channel, which at this point has been opened and worked with great success by various companies.

A very important work is now in progress here by the Blue Gravel Range Company, who are sinking a shaft on the principal channel that traverses this section of the county. A more eligible site for the purpose could hardly have been selected, this shaft being situated just below the junction of the Yankee Jim and Forest hill branches, two of the richest of these old channels ever opened in the State. When completed, this shaft, already well advanced, will, without doubt, open up one of the most prolific of all these subterranean repositories yet explored. Considering how well this class of deposits has paid wherever they have been properly opened and worked, how easily proprietorship can be obtained, and how cheaply they can be outfitted and developed, they would certainly seem to invite the attention of those desirous of embarking either their labor or money in the business of gold mining.

TWO-HEADED SNAKES IN COLUMBIA.—A friend brings us information of a double-headed snake killed in the State of Tolima, United States of Colombia, South America, close to the village of Santa Ana. The natives call this snake the "Talla Aykiss," and it is said to be one of the most venomous snakes of the country, and grows to the length of 15 feet. A specimen was brought to California by C. R. Clark, late Sheriff of Nevada county. It is now in possession of Miss Mary Gass, Oakland. Mr. Clark put in the first regular sluices for mining in Colombia.

A Free Public Library for San Francisco.

Our people are at length beginning to act in the matter of establishing a free library in San Francisco, a movement that for the credit of the city and the welfare of the rising generation has been deferred too long. From the character of the men who have taken the business in hand and the popular interest manifested on the subject, there is good reason to hope that these efforts will result in the early creation here of an institution of this kind that will compare favorably with those existing in other large towns and do honor to its founders. At a meeting of the people, held some two weeks since, a committee, composed of our most influential and intelligent citizens, was chosen to confer with the Board of Supervisors in relation to this matter, and to take such other preliminary steps as might to them seem proper in the premises. Being without funds to purchase books or even secure suitable rooms to begin with, this committee have applied to the Board of Supervisors for an appropriation sufficient to secure these ends in a small way, it being probable that suitable apartments can be had for the purpose in the old City Hall, portions of which will soon be vacated by the present occupants. Should this be the case, a few thousand dollars would suffice to purchase enough books to commence with, it being safe to count on some donations from private parties, if, indeed, it might not confidently be expected that some of our rich men would avail themselves of such a favorable opportunity to glorify their names by liberally endowing the institution from their own coffers. Through nothing left of all their great fortunes will the memories of Girard and Astor be so well preserved as through the college and the library that bears their respective names. Let this be marked by such of our millionaires as would hereafter be remembered with gratitude and praise.

If, however, individual bounty cannot be depended upon to accomplish this beneficent work, the public funds must be made to do it. An annual contribution of \$50,000 or \$60,000 from the city treasury would suffice, if continued for a series of five or six years, and certainly no better investment could be made if we contemplate this subject solely from a financial point of view. A reading community is not apt to be an improvident or an immoral one. But they cannot read without books, and to supply these in the most economical way, and of the right kind, can best be effected through the instrumentality of a free public library.

Where to Go.

We are inquired of as to what part of the State seems to afford the best chance for surface diggings. Just now, and for the few weeks that water, coming through other than artificial channels, will last, small wages can be made in almost any of the mining counties, working the surface placers. After that, it will be difficult to make even small wages anywhere in this class of diggings, the best opportunities offering being found in the more northern counties, such as Sierra, Plumas and Siskiyou. As to the precise localities of such diggings, even there we are not fully advised, though a person visiting that region would have no trouble in ascertaining their whereabouts. There are plenty of rich spots left, but they are without water and so situated that none can be readily brought upon them; there being also many places where fair wages could be made in this class of mines, that are now occupied by the Chinese, who hold them under bills of sale or leases from the whites. It is much easier now to find places where wages can be made at drift than at surface mining. In most of these places long tunnels require to be run, while in others the pay gravel can be reached through shafts varying from 20 or 30 to 100 feet in depth, as in the vicinity of Folsom, concerning which we have spoken elsewhere in this issue of the PRESS. As this kind of diggings are tolerably common and easily opened, they are perhaps as good as any for the laboring man with small means to engage in. The best way, after all, for the man who wishes to get to work in this branch of mining, is to go out into the mines and look about for himself, keeping in view the general fact that the counties mentioned offer the best opportunities for his doing so. When the active, industrious man gets out into the mines, wherever it may be, he is apt to find a good chance for doing something.

BULLION SHIPMENTS.—Since our last issue, shipments of bullion from the prominent mines have been as follows: California, April 24th, \$145,424.79; Con. Virginia, 24th, \$100,612.44; McCracken, 23d, \$17,500; Christy, 25th, \$5,627; Tybo Con., 20th, \$3,804.55; Star, 23d, \$6,500; Northern Belle, 22d, \$2,086.05; Gold Hill (Idaho), for April, \$12,194; Tybo Con., 22d, \$3,874.36; Manhattan, 26th, \$16,500; Standard, 24th, \$18,309.41; Northern Belle, 24th, \$3,603.50; California, 27th, \$115,036.25; Con. Virginia, 27th, \$136,651.06; Justice, 27th, \$10,997.58; Tybo Con., 25th, \$7,880.58; Tybo Con., 26th, \$3,985.92; Mabattan, 29th, \$15,900; Christy, 30th, \$7,641; Grand Prize, 30th, \$17,800; Northern Belle, 27th, \$3,654.01.

The Art of Mechanical Design.

(Written for the PRESS.—No. 2.)

The first question which presents itself to the constructor of machinery is the requisite strength and thickness of the metal. Take, for example, the cylinder illustrated in the previous article. I have often been asked for a mathematical rule for the same. None, however, exists. It is simply a question of practice, experience and use, and as the thickness of cast-iron does not vary much, by actual practice one can readily say to a sixteenth of an inch for almost any part of the different sizes of steam engines.

As a rule, the tendency is to make all parts too thick. Notable instances have occurred where, owing to a settling of the metal, cylinders have been working for years one and a quarter inches one side, with scarce a quarter inch of metal on the other. The proposed thickness in this case was three-quarters of an inch—experience proved five-eighths ample. The proportions of the parts of the horizontal steam engine are found to vary little, and the diameter of the piston-rod is taken as a standard from which all working parts are proportioned, as stated in the numerous tables published; the diameter of the cylinder likewise forms the basis of proportioning the capacity of all the steam ways, chambers, etc.

Care must be taken to round off all the corners. If it be true, as stated, that there is no straight line in nature, or natural growth and

Fig. II.

Fig. III.

BEST'S IMPROVED WASHING MACHINE.

construction, we find it to our advantage to follow this precedent and example here set forth, and blend in suitable curves one line with another, making all separate parts form one solid, compact and substantial structure. These points borne in mind, the process of designing framing for any machine is much simplified, and becomes an easy routine with a little practice. This point is closely allied to the mining interests of this coast. Heretofore it has been in that and many other cases simply a question of crowding all the metal into the parts that could be used, and in numerous parts one-third of the metal used could conveniently be dispensed with, with no diminution of strength, and much saving in transportation of bulk.

The eye, with a little practice, soon learns to detect the curves of greatest strength and economy in the designs of cast-iron framing, and many tons of metal might be saved annually in the construction of mining machines in this particular. The branches of a tree, the limbs of the human body, form the very best pattern for the model maker and machinist, where designing the lightest and yet the strongest sections of metal in machine framing.

It is to be hoped that every mechanic who has seen the previous number of the PRESS, bas, by following the easy instructions therein contained, drawn out the steam engine cylinder, piston and rod, as fully therein explained.

Minute matters, in designing, as in every other industry, can alone command success, and we now direct the attention of all to the small curve filling in and taking the place of every corner where the metal is altered in thickness or shape; this, as will be readily seen, is to strengthen and render compact the varied shapes of the cast-iron cylinder, and should be carefully reviewed and corrected by the student in his own drawing. If he now finds it agrees

with the design of the steam engine cylinder, heretofore produced, he may rest satisfied that he has mastered no small but an invaluable task in the art of mechanical design. One practical lesson suggests itself on closing this article. Don't waste money in experimenting, but go and draw out your ideas. The first step in success is to possess a fair working drawing. J. HEBURN, Engineer.

Best's Improved Washing Machine.

The accompanying engravings illustrate an improved washing machine, patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Daniel Best, of Auburn, Baker county, Oregon. Fig. 1 shows the machine in operation. There are two horizontal rollers placed in a frame, as far apart as the width of the side-boards. Around these rollers runs an endless slot-belt. A crank applied to one of the journals of the rollers, works the belt round the rollers. A series of small rollers are mounted parallel with each other above the slot-belt, each having a spiral spring, so that it will exert an independent pressure on the upper surface of the moving belt. The clothes to be washed are taken singly and introduced between the endless belt and the rollers, when, by applying the brake shown on top of the machine, the rotation of the rollers is retarded and the endless slot-belt travels on, thus holding and rubbing the clothes very similar to the process of washing by hand. The clothes are also squeezed between the belt and rollers, so that the dirty

Fig. I.

Fig. IV.

water is expressed, thus preparing them to receive a fresh saturation after they drop into the tub again.

Figs. 2 and 3 speak for themselves, as showing the difference between washing with a machine and by hand, and the influence it exerts in household economy and comfort.

Fig. 4 shows another apparatus devised by Mr. Best for utilizing a common wash-board, and taking the friction off the knuckles. A rod or guide is attached to the side of the board, and a rubber connected to it by means of arms which slide on the rod, so that the rubber may be moved up and down. The rubber way is tipped back and the clothes placed on the board. Then the rubber is turned back, and by taking hold of the handle and working the rubber the clothes are quickly scrubbed. The hard rubber has a corrugated surface, and the wash-board has corrugations formed by small rollers instead of grooves, said rollers being free to revolve as the hand rubber is moved back and forth over them. These devices are both of great utility, and of simple construction. Mr. Best may be addressed as above for further information.

OCEAN STEAMER AT ST. LOUIS.—The Secretary of the Navy announces his intention of testing the navigation of the Mississippi river by sending an ocean steamer, the *Plymouth*, on an expedition in June. She will start from New Orleans, with order to ascend the river during the June rise as far as possible. Two years ago the *Plymouth* came up the river as far as Natchez, and this year she hopes to come as far as St. Louis.

INDIANS ON PUYALLUP RESERVATION are busy clearing and planting, and this year will cultivate more land than ever before.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

AUTOMATIC WEIGHING DEVICE AND REGISTER.—J. C. Hunt, Sheridan, Placer county, Cal. The improvements are in devices for automatically weighing and registering grain and other substances. They consist in a rotating, self-discharging weighing scale, having a vertical movement, by which its position is changed when full or empty, and this alternate change of position is made the means of operating a gate or valve, to shut off and admit the material to the scale and also operate the registering device. The operation of continued weighing, discharging and recording will continue as long as material is supplied to the machine.

FOLDING CARRIAGE DOOR.—Anthony Bink, S. F. The improvements relate to that class of carriages in which the top or hood is made to be thrown back or forward, so as to leave an open carriage. The invention consists more particularly in a novel construction of the door with its pillar, top bar and rear standing pillar, so that, while they may be folded down out of the way in the open carriage, it will be possible to form a complete door-frame when the hood is up.

SPINNING TOP.—Christopher Raetz, S. F. This spinning top has a handle with a torsional actuating or propelling spring and an actuating shaft, constructed with a notched end, so that it may be temporarily connected with the corresponding end or stem of the top. There is also a trigger, which holds the spring or releases it when desired. The spring is wound up, and, by pulling the trigger, the top will be disengaged from the clutch by the momentum of the spring and is thus caused to spin.

COUNTING AND FORMING COIN PACKAGES.—Jas. Ostergard, Cherry Creek, Nev. The device is intended for counting a number of coins and forming them into a roll, so that they can be conveniently covered or inclosed either by paper or other form of coin holder. It consists of a metallic base, having vertical standards, between which a certain number of coins are placed to form a package.

CARRIAGE.—Joseph J. Gallagher, Davisville, Yolo county. This invention relates to certain improvements in the construction of carriages, and consists in a novel construction and combination of springs for supporting the buggy and also in the gearing.

NAPKIN HOLDER.—Lucius Thompson, S. F. This improved device is intended for clasp ing or holding the corner or edge of a table napkin, in combination with a hook for suspending it from the neck-band of a person, for protecting his or her clothing while eating.

HYDRAULIC MACHINERY REQUIRED IN CHILE.

—Mr. John Sewell writes from Valparaiso to his brother in this city, advising him of the return of Mr. H. Holcombe from a prospecting trip in the auriferous gravel fields of Southern Chile. He represents the country as being in every respect a fine one, possessing a cool, pleasant climate and abounding with splendid forests. In washing with the hatea he found ground of such promise that he was induced to leave 50 men to test it in depth. The merchants of Valparaiso outfitted this expedition, contributing in the first instance \$3,500, which will now be followed up with the amount of funds necessary for working purposes. As the business of hydraulic mining is likely to be inaugurated in that country, it might be well for our foundrymen and others engaged in the manufacture of implements and apparatus adapted to that use, to take measures for supplying the same to these Chilean miners, who, in the course of time, may possibly require a good deal in this line. A responsible English house in Valparaiso have, we are informed, signified their willingness to receive consignments of this class of goods. Concerning this house more full particulars may be learned through Mr. Henry Sewell, at 315 Pine street, Room 34, in this city.

RAILROAD IN ECUADOR.—The *American Manufacturer* says: A party of Americans now in Ecuador are negotiating with the government of that country for the building of a railroad. We have received another letter from our correspondent in Ecuador, in which he says he hopes shortly to be able to give particulars. He writes: "Such a work will make a greater change in this country than a similar one in any other, on account of the utter want of facilities for communication existing at present, and its accomplishment will be of immense value to the United States, both as to influence and commercial interests."

The people of Oregon are delighted with the new steamer bearing the name of their State, which lately arrived out from New York in the short space of 57 days 2 hours running time. She is the largest and finest steamer that ever visited Portland.

FOREIGN PATENTS

FOR PACIFIC STATES INVENTORS

ARE SECURED IN MUCH LESS TIME,

—BY—

DEWEY & CO.,

PROPRIETORS OF THE

Mining and Scientific Press,

THAN THROUGH ANY OTHER AGENCY.

Established in 1860.

THIS FIRM CAN BE RELIED UPON

—AS—

Honest, Competent, Permanent,

ALL OF WHICH POINTS ARE IMPERATIVELY
REQUISITE IN ATTORNEYS, FOR THE IN-
TERESTS OF THEIR APPLICANTS FOR
PATENTS IN DISTANT LANDS.

Our Associates and Correspondents are the
Best Practitioners in every country where Pat-
ents are granted.

For Foreign Patents no model is required, as
a rule, except in Canada. The Specifications and
Drawings of the American Patent, if com-
plete and perfect, will suffice for us to prepare
the case. In Great Britain and other countries
we apply for patents in the inventors' own
names, thus avoiding their being published to
the world in the name of a foreign agent, as is
usual through other and less painstaking agen-
cies.

Frequently several inventions, covered by
different patents in the United States, on the
same subject, can be skillfully combined in one
patent in foreign countries, when well under-
stood by intelligent attorneys.

As the privileges of our inventors are cut off
in some countries, and curtailed in others, if not
applied for soon after the issue of the U. S.
patent, we advise inventors whose patents will
be valuable in various populous civilized coun-
tries, to lose no time in applying for patents
whenever they intend to obtain them for them-
selves or the benefit of others—with their own
means or through the resources of those who are
permitted to share the benefits. It must be
remembered that the English (and some other
important nations) invite the early introduction
of inventions into their realms, by offering pat-
ents to the first introducer (which means the
first applicant), without regard to the rights of
the actual inventor, who has no after recourse.

For important inventions it is best to apply
for foreign patents at the time of application for
or before the issue of the U. S. patent.

Term of Patents in Foreign Countries.

COUNTRIES.	PERIOD OF YEARS GRANTED, ETC.
Australian Colonies:	
Victoria.....	14 years in successive periods, 3, 4 & 7 yrs.
Tasmania.....	14 years in successive periods, 3, 4 & 7 yrs.
New South Wales.....	10 to 14 years.
Queensland.....	7 to 14 years.
New Zealand.....	Full term, 14 years.
Austria.....	15 years, by annuities.
Argentina Republic.....	25 years or more, de- termined by gov't.
Belgium.....	20 years by annuities.
Brazil.....	5 to 20 years.
Canada, (including British Columbia). ..	14 years.
Chile.....	25 years or more, de- termined by gov't.
Cuba.....	5, 10 and 15 years.
Denmark.....	5 to 20 years, at the option of gov't.
England.....	14 years, in successive periods, 3, 4 & 7 yrs.
France.....	15 years, by annuities.
German Empire.....	15 years.
Italy.....	12 years, by annuities.
India.....	14 years, 5 copies, spec- ification required.
Mexico.....	Full term, 10 years.
Norway.....	5 to 10 years, at the option of gov't.
Portugal.....	Importation 3 yrs, Inven- tion 15 yrs.
Peru.....	25 years or more, de- termined by gov't.
Russia.....	Importation 1 to 6 yrs, Invention 3, 5, 10 yrs.
Spain.....	Importation, 5 yrs, In- vention 5, 10, 15 yrs.
Sweden.....	3 to 5 yrs, at the op- tion of government.

We have the Foreign Patent Laws, Foreign
Patent Reports, and other valuable and assist-
ing documents, for ready reference in our MIN-
ING AND SCIENTIFIC PRESS Patent Agency Li-
brary—the most complete Patent Library on
this side of the Continent.

The cost of patents in any one or more of the
above countries will be furnished on applica-
tion to us.

Any further information regarding the time
within which patents must be worked in any
foreign country, time of payment and amount
of annuities for patents in any of the above
countries, will be cheerfully given on applica-
tion.

Full particulars regarding any countries not
named above, will also be given when desired.

DEWEY & CO., Patent Agents,

Publishers of the MINING AND SCIENTIFIC PRESS
and the PACIFIC RURAL PRESS, San Francisco.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo
of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map
of Arizona yet published, and gives the latest mining dis-
tricts. The volume will be profusely illustrated, contain-
ing full page lithograph views of the Loop, at Tehachapae
Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Flo-
rence, Tucson, and Tubac; the ancient church of San
Xavier del Bac, ruins of the Tumacacori Mission and of
Mount Wrightson, and other views of the Santa Rita
Mountains. Calabazas, in the valley of Santa Cruz;
Coronacon Peak, the Ariave Valley and the ruins of
Casa Grande.

Also, numerous other engravings of mines and scenes,
comprising Mineral Park, Fort Whipple, Castle Dome,
Oakman Flat, the Rio Verde Valley, Montezuma's Well,
the Salt River Ruins, Indians, Public Buildings, Ancient
Ruins and Remains, etc. In addition to these illustra-
tions, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy
of the famous Father Kino's Map, and profile maps of the
Mining District of Mohave County, in which the Mc-
Cracken mine is located; of Castle Dome District, Yuma
County; of the Bradshaw District, near Prescott, where
the Peak mine is worked; of the Pioneer, in which the
famous Silver King is located; the Globe, where the
Wheatfield, Stonewall Jackson and Miami mines are found;
and of the extraordinary rich Santa Rita Districts, the
Aztec and Tyndall.

The letter press will be crammed with valuable infor-
mation, interesting description and accurate data as to
the resources of Arizona—its geology, mineralogy, mines,
mining, agriculture, etc.; also, of its roads, routes, fares,
etc. Its historical chapter will be invaluable; and those
on the Ancient People and Ruins of Arizona, as well as
on the Jesuit Missions, Indians, etc., will prove of absorb-
ing interest.

This is the most complete work on a new Territory or
mining region ever issued. It is the result of conscientious
observation and study; the author having made extended
tours through the Territory, and being also in possession
of the note-books of mining engineers and explorers, who
spent years in examining this marvelous country, which
is soon destined to be recognized as the Richest Silver
Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound
in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA,
Handsomely colored and mounted, now ready for delivery.
Retail, on rollers, for the wall, \$2.50 each; in covers,
\$1.50 each.

Liberal deductions made for the trade. Address

PAYOT, UPHAM & CO.,

Publishers and Wholesale Stationers, 204 Sansome
Street, San Francisco, Cal.

Also, for sale at the above prices by

DEWEY & CO.,

Publisher of the MINING AND SCIENTIFIC PRESS, S. F.

The Mining & Scientific Press,

Is the leading mining journal in America, and it enjoys a
large circulation among the more intelligent operators
and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pa-
cific Coast it is decidedly popular, and is a standard journal
with the most thrifty industrial people of the Pacific
States and Territories. Its authority is of the highest
order, and its usefulness in its special sphere unrivaled.
Every public library, mining engineer, metallurgist,
mining operator and intelligent mechanic and manufac-
turer will find profit by its reading.

Subscription, postage prepaid, \$4 a year in advance.
Sample copies, post paid, ten cents.

DEWEY & CO., Publishers, S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the
cause of practical knowledge and science, by assisting
Agents in their labors of canvassing, by lending their
influence and encouraging favors. We intend to send
none but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—California.

A. C. KNOX—Pacific Coast.

C. N. WEST—Santa Clara, Monterey and San Benito
counties.

A. C. CHAMPTION—Tulare, Fresno and Inyo counties.

Islands.W. D. WHITE—San Bernardino and Los Angeles coun-
ties.

J. W. A. WRIGHT—Sacramento county.

B. E. LYON—Sonoma and Napa counties.

E. M. DEXY, Oregon.

H. E. HALLETT—Marion county.

G. W. MCCREW—Santa Clara county.

Wm. L. BREWER—Black Hills, Dakota Territory.

RICHARD ALLEN—British Columbia.

From A Patentee.

HUNSAKER, TULARE CO., CAL., Jan. 15, 1878.
* * * You will now receive my grateful heart-
felt thanks for the able manner in which you have con-
ducted the interest entrusted to you by me. Your ac-
knowledgeed ability, confirmed to me as it is by the suc-
cessful presentation of my claim for a patent on a pump
power, not only delights me, but suggests the propriety
of my continued patronage and that of all my friends.
With kind wishes for your future success, I subscribe my-
self, yours respectfully,
A. L. HUNSAKER.

Messrs. DEWEY & Co., Patent Solicitors, S. F.

TO QUERISTS.

In propounding questions to the editorial, patent or busi-
ness departments of this office, letter writers should be
careful to enclose a stamp and addressed envelope if
they wish prompt answer. If we were to furnish time, pa-
per, envelopes and stamps, all free to parties who address
this office on matters of more interest to themselves than
to us, FIVE HUNDRED DOLLARS A YEAR would not cover the
expense. This hint, however, is not intended for parties
writing in our own or the public interest, or who would
be obliged to delay writing at any time for want of an ex-
tra stamp.

EVERY new subscriber who does not receive
the paper and every old subscriber not credited
on the label within two weeks after paying for
this paper, should write personally to the pub-
lishers without delay, to secure proper credit.
This is necessary to protect us and subscri-
bers against the acts and mistakes of others.

A Few Words About the "Mining and Sci-
entific Press Patent Agency."

The Patent Agency of Dewey & Co. has been
the most successful of the professional
business establishments of this coast, being
well and favorably known to every
subject. For the past years as Secretary of
the California Academy of Science, he has also
been its most successful member of the
various fields of scientific research.

It is a recognition on the part of the firm in
that after many years of a continuous course
of patent soliciting, and scientific and mechanical
publishing, that there are not few of the
best equipped and practical offices in the
United States, so well and ably prepared to
intelligently secure full rights for inventors in
general under the patent laws of the United
States and foreign countries. For Pacific coast
inventors we are more especially ready to act
with superior advantage. We have original
copies and files of thousands of Pacific coast
cases which have passed through our hands,
and a particularly large number of the most
valuable and important cases in the field of
mining, metallurgy and our re-
spective agricultural, agricultural, and mechanical
industries.

As editors and publishers of agricultural and
mechanical and industrial journals we have
been able to secure for our subscribers the most
valuable information which we constantly use for
the benefit of our subscribers—information that could
be secured in no other manner, and which we
are prepared to supply to our subscribers at a
very low price.

We have in our office the most complete sets
of the various foreign patent laws, and me-
chanical, agricultural and industrial journals, and
we are prepared to supply to our subscribers the most
valuable information which we constantly use for
the benefit of our subscribers—information that could
be secured in no other manner, and which we
are prepared to supply to our subscribers at a
very low price.

Many inventors have been greatly aided in
the cause of science in many instances—by the
valuable information which we constantly use for
the benefit of our subscribers—information that could
be secured in no other manner, and which we
are prepared to supply to our subscribers at a
very low price.

Many inventors have been greatly aided in
the cause of science in many instances—by the

are prepared to supply to our subscribers at a
very low price.

(From the Pittsburg Post, December 24th, 1877.)
\$5,000 for the Poor of Pittsburg if Mellor
or Weber Furnish Proof.

To the Editors of the Pittsburg Post:—Mr. C. C. Mel-
lor, in his card entitled "A few facts for the public to
consider," which appeared in your columns on the 15th
instant, states as follows:

"The subject Weber's figures, and the Judges' names
attached to them, are as follows:

Now, then, if Mr. Albert Weber, or his agent, Mellor,
can or will produce any document, certificates or writing,
with the genuine signature attached of the Honorable
H. L. Oliver, Geo. F. Bristow, P. F. Kupka and Julius
Schiedmayer (or a majority of them) who were the Exam-
ining Judges at the Centennial Exhibition, Philadelphia,
1876, declaring or certifying that Weber received a higher
average than 90% out of a possible 96; or, if Mr. Weber, or
his agent, Mellor, can prove the genuineness of the signa-
ture of some gentleman (or a majority of them) that Weber did
receive more than \$3 on Square Pianos out of a possible
96; or 93 on Upright Pianos out of a possible 96; 93 on Parlor
Grand out of a possible 96; 93 on Concert Grand out of a
possible 96; or, if Mr. Weber or his agent, Mellor, can
show by a certificate or statement in writing of the same
judges (or a majority of them) that Steinway's claim,
sustained by official and documentary evidence is not true
and well founded, viz:

That Steinway ranked first in every style of Piano,
and that Steinway did receive 90 on Square Piano out of
a possible 96; 96 on Upright Piano out of a possible 96;
96 on Parlor Grand out of a possible 96; 94 on Concert
Grand out of a possible 96, we will place the sum of \$5,000
in the hands of the Mayor of the city of Pittsburg, to be
distributed for the benefit of the poor of our city.

The public must understand that Weber's figures, as ad-
vertised by Mellor, are false and fraudulent, and that they
are given upon Mr. Weber's own authority only, and
against the repeated and published protests of the Judges,
whose names he misuses.

We again declare Mr. Weber's assertion of having re-
ceived on any one of styles of pianos '95 out of a possible
96,' and his alleged ratings on the Steinway Pianos, viz:
91 out of a possible 96, to be a barefaced falsehood, un-
supported by any documentary evidence from the Judges,
and contrary to their published declaration.

Respectfully yours,

H. KLEBER & BRO.

We will Mr. Mellor furnish the desired proof, and thus
benefit the poor of Pittsburg to the amount of \$5,000, or
will he stand convicted of having willfully assisted to de-
ceive and hoodwink the public ever since the Centen-
nial?

Letter from the Great American Composer,
Geo. F. Bristow.

New York, December 17th, 1877.

To the Editors of the Commercial Gazette:—Dear
Sir:—My attention has been directed to a card of Mr. C.
C. Mellor, appearing in your issue of the 15th instant,
containing certain figures purporting to have been made
up by the Examining Judges at the Centennial
Exhibition, Philadelphia, 1876. Mr. Mellor and other
Agents of Mr. Albert Weber quote my figures on the
Steinway Pianos incorrectly. I gave to Messrs. Steinway
& Sons, on account of the general excellence of their in-
struments, the following figures, viz: tone 6, equality 6,
touch 6. Moreover, I have never authorized Mr. Albert
Weber to make use of my name in connection with his
pianos, as a member of the Group of Judges XXV, United
States Centennial Exposition. Respectfully yours,
GEORGE F. BRISTOW.

FORTY
ACRE
FARMS.

In offering the Reading Ranch for sale in
sub-divisions, I am disposed to accommodate the
interests of all classes of desirable settlers, I
therefore offer (besides large tracts) to sell farms
(in favorable locations) of from 40 to 100 acres,
at from \$20 to \$30 per acre. Semi-tropical fruits,
corn, vegetables, and all kinds of grain and
grasses, (including alfalfa,) will grow well with-
out irrigation on these lands. The Oregon Di-
vision of the C. P. R. R., and a brisk growing
town are near the land on the west, while the
Sacramento river is near at hand on the east.
For further information of the Reading
Grant, see my advertisement which appears
from time to time in this paper. Address the
proprietor on the premises,

EDWARD FRISBIE,
ANDERSON, SHASTA COUNTY, CAL.

Send for descriptive pamphlet.
BAUGH & SONS, Philadelphia.

STEAM ENGINES AND BOILERS.

One new Straw-burning Portable Engine, made by Ransome, Sims & Head, Ipswich, England. This is a very superior engine, sent here as a sample engine for exhibition; one second-hand Straw-burning Engine, 8x10 inch cylinder, (Rice); one second-hand Wood-burning Engine, 8x12 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 7x10 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 5x10 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 6x12 inch cylinder, side engine; one new Stationary Engine, independent cut-off, 12x24 inch cylinder. (The Straw-burning Engines named are free from infringements.)

One large sized Rock Breaker, Varney & Rix, size 9x15; one Wood Splitting Machine; one 30-inch cylinder Russel Separator, (with extra cylinder,) and Lauffenberg shoe—very cheap, on account of owner's death; (will be sold with or without any of above engines.) All of the above second-hand engines have been in shop and overhauled, and are in good working order. Various other machinery for sale. Purchase made on Commission. Machinery repairs solicited. Specialty of Portable Engines and Boilers for threshing.

J. W. RILEY, (Box 2361) San Francisco.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
 One man, per day.....\$ 3 50
 One man, per day.....3 00
 Wood, 1 1/2 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
 Cost of one ton.....67 1/2

From 2 1/2 to 5 per cent. of salt is necessary. In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address: JUDON W. WEBSTER, Paymaster Mine, Reno, Nev. LEWIS CHALMERS, Manager Exchequer and IXL Mines, Silver Mountain, Cal.

J. S. COSE, Vice-President Tehama County Bank, Red Bluff, Cal.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 20th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

GREAT ENTERPRISE!

—THE—

Sierra Flume & Lumber Co.

Have over 100,000 Acres of

SUGAR PINE, YELLOW PINE, SPRUCE

Fir and Cedar Lands,

10 Saw Mills, 3 Planing Mills, 1 Sash and Door Factory,

149 Miles V Flumes,
10 Miles Tramway,
157 Miles Telegraph Line,
13 Telegraph Stations,

Employ 475 Men and 550 Oxen & Horses.

The Sugar Pine is unsurpassed in quality, and the whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to any other hard Pine for Flooring, Stepping, etc.

The Spruce has great strength, durable when exposed, and especially adapted to Bridge and Ship Building, while the Fir and Cedar are as valuable for a great variety of purposes.

Last year thirty millions of feet were cut and the estimate for 1877 is fifty millions; fifteen millions are now on hand, thoroughly seasoned by the hot climate of Red Bluff and Chico.

Large orders can be filled on a days' notice for all kinds of

BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial work may be accomplished without delay at the usual cost for green lumber.

Orders for the interior filled at less than San Francisco prices and freights.

DOORS, SASH AND BLINDS always on hand in large quantities. Address

SIERRA FLUME AND LUMBER CO.

25 STYLES OF CARDS, with name in gold, 10 cents.
J. B. HUSTED, Nassau, New York.

R. HOE & CO.'S CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remain sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Filee are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

H. L. TATUM & Co., Sole Agents,
 No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CURS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or stop, and at a merely nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAN FRANCISCO.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.

Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Thirtieth Industrial Exhibition of the Mechanics' Institute, S. F.

The Board of Managers have the honor to announce that the Thirtieth Exhibition of the Mechanics' Institute, and the fifth annual one given in the grand pavilion on Mission, Market and Eighth streets, will open to the public August 6th, and close September 7th, 1878.

The public are respectfully requested to respond liberally as exhibitors and visitors, and thus enable the Board of Trustees to realize from this fair a sum sufficient to liquidate the small indebtedness now due on the Mechanics' Institute library property, and to answer a speedy fulfillment of the sanguine hope of the Trustees and well-wishers of the Society to make it a free library for mechanics and apprentices, the Board to institute permanent classes for instruction in the mechanic arts.

The exhibition building is 550 feet long, 200 feet wide, centrally located, and accessible by six lines of street cars, giving direct communication with all parts of the city.

The promenade is a gallery under the main nave, 16 feet wide and 1,000 feet long, from which an unobstructed view of the interior is obtained.

In addition there is an annex 220 feet long by 75 feet wide, containing the exotic garden, which will contain all that is rare and beautiful in the floral and horticultural world, increased by the finest rustic and picturesque effects obtainable. The whole, pavilion and garden, will be brilliantly illuminated at night.

The art gallery, 400 feet long by 50 wide, will be made specially attractive by paintings, statuary and works of art. The Managers are happy to announce that the San Francisco Art Association have kindly consented to take charge of the same, and that our local artists have promised to display their best productions.

Among the many attractions this year the musical part of the exhibition will be a noted feature, as the best obtainable orchestra will each afternoon and evening give a grand instrumental concert, introducing the latest and most pleasing novelties of musical composition.

A fine refreshment saloon, restaurant, and 4,500 comfortable seats will be provided for the convenience of visitors, of which the average attendance during the last exhibition was 12,500 per day.

The Board of Managers particularly desire that the natural and manufactured products of this coast should be well represented, and to that end all possible facilities will be extended to exhibitors of such articles.

A large and powerful engine will furnish ample motive power, while steam and water will be furnished for such machines and appliances as require them, free of cost to the exhibitors. The main line of shafting is 490 feet long, with pulleys sufficient for all requirements.

It is expected that the various transportation companies will convey goods intended for exhibition at one-half the usual rates.

The matter of premiums has not yet been determined upon.

Applications for space, rules and regulations, or any information regarding the exhibition, will be given or sent by addressing the Secretary.

Board of Managers:

Irving M. Scott, Henry L. Davis, Asa R. Wells, James Duffy, C. Waterhouse, George Spaulding, James Drury, H. S. Smith, James Spiers, D. A. McDonald, J. B. Stetson, H. L. Hutchinson, Nathaniel Hunter, A. L. Fish.

J. H. CULVER, Secretary, 27 Post st.

Woodward's Gardens were never more attractive than at present. A fine lion and two lionesses, all young and not fully grown, have just been added. Balloon ascensions by Prof. Martin are now being made. The popularity of the gardens continues to increase. Rates of admission unchanged.

AYER & SON'S MANUAL contains information of much value to advertisers; sent free. Address N. W. Ayer & Son, Advertising Agents, Times' Building, Philadelphia.

ABOUT SECURING U. S. COPYRIGHTS. TRADEMARKS, LABELS, Etc.

[Under the Revised Act of Congress, which took effect August 1st, 1874.]

No copyright is valid unless notice is given by inserting in every copy published, on the title page or the page following, if it be a book; or, if a map, chart, musical composition, print, cut, engraving, photograph, painting, drawing, chromo, statue, statuette, or model or design intended to be perfected as a work of the fine arts, by inscribing upon some portion thereof, or on the substance on which the same is mounted, the following words, viz: "Entered according to the act of Congress, in the year _____, by _____, in the office of the Librarian of Congress, at Washington;" or, at the option of the person entering the copyright, the words: "Copyright, 18____ by _____."

The law imposes a penalty of \$100 upon any person who has not obtained copyright who shall insert the notice "Entered according to act of Congress," or "Copyright," etc., or words of the same import, in or upon any book or other article.

Each copyright secures the exclusive right of publishing the book or article copyrighted for the term of 25 years. Six months before the end of that time, the author of design, or his widow or children, may secure a renewal for the further term of 14 years, making 42 years in all. Applications for renewal must be accompanied by explicit statement of ownership, in the case of the author, or of relationship, in the case of his heirs, and must state definitely the date and place of entry of the original copyright.

[Our terms for securing a copyright certificate is \$5, including the Government fee.]

[Our terms for securing certificate of registration for a label is \$16, including Government fee.]

Copyrights cannot be granted upon trademarks, nor upon labels intended to be used with any article of manufacture. If protection for such prints or labels is desired, application must be made to the Patent Office, where they are registered at a fee of \$8 for labels and \$25 for trademarks.

Applicants for the registration of trademarks must file the following papers in the Patent office, to wit:

1. A specification fully describing the trademark.

2. A petition by the party or firm.

3. An oath by some member of the firm, if it be a firm; otherwise by the owner.

[Our terms for securing the registration of a trademark (issued in the form of a patent) is \$40, including Government fees.]

If you have a label which you desire to protect against imitation, you can have this done by complying with the following rules, viz:

1. Send us six copies of the label, and full name of proprietor.

2. State the class of goods to be protected; and give a brief description of your business.

For further information concerning the above, U. S. and Foreign Patents, Caveats and general patent soliciting business, address

DEWEY & CO., S. F.

The Large Circulation of the Mining and Scientific Press extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

MR. W. J. WOODLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

REGISTER YOUR TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

Several first premiums received
for Quartz Mill Screens, and Per-
forated Sheet Metals of every
description. I would call special
attention to my SLOT CUT and
SLOT PUNCHED SCREENS,
which are attracting much at-
tention and giving universal
satisfaction. This is the only
establishment on the coast de-
voted exclusively to the manu-
facture of Screens. Mill owners using Battery Screens exten-
sively can contract for large supplies at favorable rates.
Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

\$1,000 Challenge Ore Feeder.

HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripo mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPO G. M. CO., }
GREENVILLE, PLUMAS CO., Oct. 16th, 1877. }

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,
Superintendent Gold Stripo Mine.

One of the principal owners of the Gold Stripo and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machine ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

ENDORSED BY THE FOLLOWING PARTIES:

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 95% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

VOLUME XXXVI.
Number 19.

Harris' Fruit Drier.

We illustrate on this page a fruit drier patented some time since through the MINING AND SCIENTIFIC PRESS Patent Agency, by Geo. Harris, 33 Second st., this city. The heater is constructed in a novel manner, so that a thin body of water or air is in contact with the heating surface, and the fuel can be utilized to the utmost, the hot air being conveyed through the drying chamber in pipes to assist in the drying, and the condensed water being used to replenish the boiler. The arrangement of the heater is such that it gives the most favorable heating with the smallest amount of fuel.

The heater is filled with water, and from its shape, when a fire is made in the fireplace, a thin stratum of water will be rapidly heated, and a very visible circulation will take place, so that in a short time the whole body of water will be brought to a boiling point. As the heater tank is made of wood, it will retain the heat with little reduction for a long time, and the radiation is so small that the heat can be easily kept up with a small quantity of fuel.

By surrounding the fireplace with a stratum of air between it and the water, the air is also heated, and not only transmits its heat to the water, but is also prevented from being burnt by any amount of heat from the fireplace. This is one of the important features of the machine, because there is never any danger of burning and spoiling the substance to be dried by too fierce a heat or by neglect.

The air circulates freely and in such a volume as to carry off the moisture from the drying room with great rapidity through the pipe, which connects with the escape flue, and it is assisted materially in this by the steam pipes from the heater tank. The trays being filled with fruit at night a fire is built, and the whole apparatus may be safely left over night without the slightest danger of fire or of spoiling the articles to be dried, because the combination renders it impossible to elevate the temperature of the air much beyond that of the water in the tank.

There are open flues on both sides of the drier for the admission of the heated air, and glass doors are provided by which light is admitted to the fruit which is in the process of drying. With grapes, particularly, this is a most important feature, as it is also with many other kinds of fruit. The trays on which the fruit is to be placed in the compartments, are made of slats, so that the hot air may circulate freely in every direction and get at the fruit on all sides.

These driers are made of various sizes at prices from \$75 to \$600, and several different kinds of fruit may be dried at the same operation without the flavor of one kind permeating the other. This is accomplished by having several compartments, in each of which a different kind of fruit may be treated. This makes really a separate drier for each kind of fruit, all in one machine. In some cases it is considered essential to cook the fruit before drying. In this machine the fruit or vegetables may be placed on the racks and cooked by the steam over the heater, and then be placed on the same racks inside of the drier. It is claimed that the fruit dried by this process is much superior to that treated by any other process in use.

Premiums have been awarded to this apparatus at every fair where it has been exhibited, including that of the Mechanics' Institute in this city last year. After 10 years use of the drier, several persons who have used it say there is no fault which they can find with it whatever. Farmers who have only a small quantity of fruit to dry may prepare it with one of these driers at small expense and little trouble. The heaters attached to it may be also used, with a slight variation, separate from the drier, for laundry purposes. From 30 to 40 gallons of water may be heated in 20 minutes. Over 200 of these heaters alone have been sold to dairy and milkmen, and have given gratifying results. It has also been applied to public and private baths. These heaters cost from \$15 to \$75 according to size and material. The experience from purchasers having them long in use, is that the saving of fuel alone in from three to

four months is sufficient to offset the cost of the heater. Chas. M. Hawes and Mr. Raymond, milkmen in the Potrero, are using the heaters for cooking barley for their cows, and say that they save from \$1.50 to \$2 a month per cow, having previously fed them barley from the brewery. The manufacturers of this apparatus are Harris & Bradley, 33 Second st., in this city.

ILLNESS OF DR. DIO LEWIS.—We learn with deep concern of the illness of Dr. Dio Lewis. He was taken with congestion of the brain and slight paralysis of the side (as it is described in the certificate signed by three physicians), just as his camping expedition was in starting. The illness was probably the result of over-exertion

HARRIS' PATENT FRUIT DRIER.

in the promotion of the camping enterprise. The campers have proceeded on their way fully equipped. The camp, as we saw it last Saturday, presented a picturesque appearance, and with its many appointments, gave one the impression of extent and completeness. The expedition goes forward with Mr. Hopkins as conductor of the train, and Mr. Ayres as teamster. Professor Lemmon superintends the scholastic element, research being mainly directed to his specialty of botany.

ITACOLUMITE.—Mr. J. S. Phillips, M. E., has received for assay and examination a num-

FLANDER'S LOCOMOTIVE CYLINDER BORING MACHINE.

ber of samples of rock from Victoria, B. C., forwarded from various mines. Among them are several specimens showing itacolumite formation. In and around such rocks diamonds and other precious stones are usually found, and this is the first instance of which we have heard of its being noticed on this coast. No diamonds have been discovered that we know of, or have they been sought for in that country, although the formation is such as would lead a mineralogist to suppose them present.

PROF. BECKER, of the University of California, will leave for Paris on the 18th inst. He will remain during the continuance of the expedition, and will then return to this State.

Locomotive Cylinder Boring Machine.

We illustrate herewith Flanders' improved locomotive cylinder boring machine, having a bar and screw of cast-steel with two extra cutter beads. It is especially adapted to boring out locomotive cylinders and driving boxes in their places by removing only one or both heads and piston. The back-head, cross-head, or slides, need not be removed unless so desired. On removing the piston and leaving the front-head and stuffing-box, a small cone takes the place of the stuffing-box at once, and with proper adjustment at the front-head is ready for work. This machine is fed with a constant

feed of cut-gears. The clamps, or cross-heads, are so arranged that they may be used conveniently on locomotive cylinders of all sizes, which is a great improvement over the old machine. The firm also manufacture bars for boring stationary and marine engine cylinders from 10 to 110 inches in diameter. These machines are very complete, doing a satisfactory job with great saving of time, and are used quite extensively in Philadelphia, New York and Pittsburg, boring out the cylinders of steamships while the cargoes are being unloaded in a rapid and satisfactory manner. They can be used with great advantage by mining com-

Academy of Sciences.

A regular semi-monthly meeting of the California Academy of Sciences was held on Monday last, Vice-President Henry Edwards in the Chair.

Professor John Le Conte, President of the University of California, was proposed for membership, as was W. B. Rising, Professor of Chemistry at the University. Mr. Jay C. Kelly was also proposed.

A number of mineral specimens were presented to the Cabinet from C. W. Crane, J. B. Haggin, B. B. Minor, Thomas Price, Dr. E. L. Willard, and the Ventura Rock Soap Company. A curious pair of deer horns, showing abnormal growth, were presented by R. S. Floyd.

A paper by Professor George Davidson was read by Mr. Christie, entitled a "A Forward Movement in Astronomy," referring to the proposition to change the location of the United States Naval Observatory at Washington to one more favorable to the health of observers, and also for obtaining better conditions for observing. The paper referred to discussions on the propositions by astronomers and cited authorities to prove that high elevations were most favorable for observation.

A dispatch was read by the President from Mr. Colonna, of the Coast Survey party, observing the transit of Mercury at Summit, California, stating that the transit was observed completely by the Coast Survey party.

Mr. W. N. Lockington read a paper entitled "Remarks upon the Star Fishes and Serpents of the Pacific Coast."

Mr. Edwards introduced to the Academy Rev. Dr. Bleasdale, of Melbourne, an eminent Australian scientist. The gentleman addressed the Academy on the subject of the necessity of making science popular, and the method by which this was being done in Australia. He spoke of the museum at the University at Melbourne, which had cost £64,000 up to the present time. This museum embraces in its scope, not only articles of scientific interest, but all such things as were being utilized in the country. By this means, all persons visiting the collection are able to see at a glance, the products of the country, the machinery by which it is worked up, the character of the soils, etc. All these things are labeled, so that no questions have to be asked by strangers, everything being clearly explained. He suggested that the Academy might extend its collection in the same manner, so as to popularize science, and be of great practical benefit to the community.

Several members of the Academy spoke in favor of collecting the useful products of the country, which might be labeled so as to give information on all sorts of subjects to persons in need of it. Considerable discussion ensued on the subject of the popularization of science, and the best methods of doing it.

Mr. Henry Edwards exhibited caterpillars from Acapulco, which had been infested by parasites. He had had the specimen three weeks, and it was the first instance he had seen of the caterpillar surviving the attacks of the parasites.

RAILROAD GAZETTEER.—This popular handbook of railway time tables, filled with entertaining literature, is widely circulated among the traveling public, and is freely read and consulted. Mr. Bean, the compiler, can now claim the fullest existing schedule of notes of travel, modes of conveyance, distances and rates of fare from San Francisco to all the towns on the Pacific coast. This schedule occupies 20 pages of the magazine, and should be kept for reference by everyone. It will save a world of inquiry when one wishes to know the distance and method of reaching any point on the coast. The *Gazetteer* is well patronized by advertisers. H. S. Crocker & Co., 401 Sansome street, are the publishers.

The famine now prevailing in the northern provinces of China, and which must continue at least six months longer, is being marked by fearful horrors. In one town a man opened a shop for the sale of human flesh, and did a good business in cannibalistic joints and roasts till the local Mandarin caused the shopkeeper to be arrested and beheaded.

MR. L. SAMUELS, publisher of the *West Shore*, at Portland, Oregon, lately spent several days in San Francisco in the interest of his enterprising illustrated monthly. He intends soon to issue it weekly.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Esmeralda District—No. 1.

An Account of Its Early History and New Departure.

Outside of the Comstock there was no excitement in the early days of quartz mining east of the Sierras, so intense and promising as that of Esmeralda, and no collapse was comparatively so complete. Deep mining was a new thing, however, and only a few bold operators, headed chiefly by the late Wm. C. Ralston, felt equal to the occasion, and they centered their capital and labor upon the general market supplies and the line of general travel—the Washoe district. Esmeralda was practically abandoned about the time the surface deposits of the Comstock were exhausted, 1864. The first quartz discovery in Esmeralda occurred on August 22d, 1860; claims were located on the 24th, and on the 30th an organization effected and recorder elected. This was brought about by three prospectors who crossed over from Mono county, California, named Jas. M. Brady, J. C. Cory and E. R. Hicks. The two former are residing in Santa Clara county, California, but nothing is known of the whereabouts of Hicks, who started for "the States" soon after the excitement, which enabled him to dispose of his interests for the sum of about \$10,000. Cory and Hicks remained longer, took considerable part in the unsystematic scramble on Last Chance, Middle and Silver Hills, realizing over \$30,000 each, and retiring to more peaceful pursuits. Cory is a well-to-do farmer, and Brady is nicely located in San Jose as a real estate and money broker.

The excitement did not culminate in Aurora before 1863, when there was a fighting, scheming population there of from 5,000 to 8,000. A good style of town was built, the specimens of brick structure yet remaining, to say nothing of the ruins of brick and mortar on every hand for miles along the leading ravine, giving ample evidence of that fact. Although Bodie was a prior discovery, it created to particular attention; built no town to speak of up to the time of the beginning of the present era, which is all new. Aurora, or rather the word Esmeralda, was in everybody's mouth, and the wild cat, as well as the tame, went off like hot cakes with golden syrup. There were nearly a dozen quartz mills erected, three of which were large brick structures, costing from \$150,000 to a quarter of a million dollars apiece, only one of which remains anything like intact, the rest being dragged away to other fields. A dime novel at least could be founded upon the blood-and-thunder facts incident to the days of '63-4, to say nothing of the ignorance of mining there displayed and the great amount of accompanying extravagance. Several duels, according to the code, were fought; desperadoes revelled in deeds of blood, four of whom ended their career simultaneously upon the same scaffold erected by the people and in full presence of the people, who rose in their might and drove the roughs by scores to other scenes, apparently sending the "Inck" of the place after them. This occurred in February, '64, and for fourteen years afterwards shares or "feet" in Del Monte, Wide West or Antelope, were at first a drug, then a stench in the nostrils of holders, or lastly of an unknown quantity with dealers of all kinds. Yet it seems hard to believe that such a state of things could ever come of so wonderful a belt of rich mineral-bearing quartz as that which is just now attracting renewed attention on the part of the heaviest and most experienced operators and mining men. Doubtless the great and expensive depths to which the Comstock claims have been worked in connection with the mere scratches on the surface of the almost better defined and richer croppings at Aurora, have had something considerable to do with this sudden widening of the circle of extensive enterprises, of which the new Del Monte shaft must be but the entering wedge of a series of the like order of works of development in this singularly long neglected district. Real estate has become valuable again in Aurora, houses that sold for taxes last year are now held at high figures, comparatively, and expectation is accordingly inspired. It may require a year to determine whether there is any real cause for all this change of heart, and it may not be demonstrated even then, but that there is an abiding faith on the part of all who have looked over the ground to the end of a second excitement in Aurora that will eclipse the first in importance and permanence, it is useless to dispute. It seems to possess more than usual significance, too, at the present juncture of affairs, when there are no new worlds to conquer, and Washoe stocks are generally under the control of one house, and becoming more so all the time. Perhaps in another article it can be set forth more satisfactorily as to leading details concerning the history of Esmeralda. J. W.

TRANSPARENT CEMENT.—The curd of milk precipitated by acetic acid, washed in clean water, and dissolved in a cold saturated solution of borax, is recommended by a continental contemporary as an excellent cement of perfect transparency.

New Tellurium Ores.

From the work of Dr. Genth who first studied and published the newly discovered ores of this element as well as well-known varieties first discovered in Colorado, the *Engineering and Mining Journal* quotes the following:

Native tellurium from mines of Keystone and Mountain Lion in Magnolia district. One variety, which appears in thin leaves with the ores, and is accompanied by a (peculiar green) mineral containing vanadium. It showed the following composition, with the exception of quartz:

Gold	0.00%
Silver	0.07%
Tellurium	96.91%
Sesquioxide of Vanadium, V_2O_3	0.49%
Sesquioxide of Iron	0.78%
Quicksilver, Alumina, Magnesia, Potassium	1.15%

Dr. Genth ascribes the presence of gold, silver, quicksilver and iron to mixtures of calaverite, coloradoite and iron pyrites, which are so dispersed through the ore as not to be separated mechanically. Another variety was discovered by Thos. Berdell in the Mountain Lion mine. These form flat, table-like discs, are grayish dull, have a column-like structure (cutting the tables at right angles), and in appearance not unlike sheet iron. Even under the lens it appears homogeneous, and accordingly Dr. Genth held it for a variety only and not a new species. The analysis gave:

Gold	1.38%
Tellurium	55.86%
Alumina	6.15%
Ferric Oxide	0.48%
Lime	0.25%
Silver	34.72%
Silico	0.17%
Magnesia	99.01%

Coloradoite (telluride of mercury) amorphous, without cleavage, compact, a little granular; fracture, uneven to hackly; hardness, 3 about; specific gravity, 8.627; metallic luster; color, iron black, with a cast of gray and a little tinge of red; commonly showing a play of colors (red, blue and green). In the closed tube it decrepitates, melts and gives an abundant sublimate of metallic mercury, drops of telluric acid, and near the assay metallic tellurium. On charcoal it gives a green flame and a white incrustation. It is soluble in nitric acid. As it was difficult to procure pure pieces for analysis, Genth still holds that the composition corresponds to the formula, Hg_2Te analogous to cinabar and trematite, consequently it should contain 60.98% mercury and 39.02% tellurium. Samples from Keystone and Smuggler mines gave the following results:

	SMUGGLER.	KEYSTONE.
After subtracting quartz and gold	6.36	46.83
Mercury	55.80	52.28
Silver	2.42	0.00
Copper	trace	0.00
Zinc	trace	0.00
Iron	1.35	2.44
Tellurium	80.24	42.95
Vanadium sesquioxide	0.00	0.70
Magnesia	0.00	0.11
Lime	0.00	0.84
Alkalis	0.00	0.00
	55.81	99.32

The composition of calaverite from the Keystone corresponds, according to Genth, to the formula ($\frac{2}{3}Au, \frac{1}{3}Ag$) Te_2

Gold	39.01%
Silver	3.06%
Tellurium	57.93%

Tellurite (telluric acid) found in cracks of the native tellurium as a yellowish white, white and yellow small prismatic crystals.

Magnetite is a new mineral found in the upper levels of the Keystone mine, and must be regarded as a product of the decomposition of Coloradoite. It forms fine needles of white color, with silky luster, which are often grouped in tufts about a little ball of quicksilver. Its composition corresponds to the formula, Hg_2TeO_4

Ferrotellurite forms a crystalline incrustation upon quartz, associated with native tellurium. Its composition corresponds probably to the formula, $FeTeO_4$. A preliminary analysis gave:

Iron	41.01%
Nickel	0.72%
Tellurium	4.06%
Sulphur	41.73%
	87.52%
	or 12.48% remainder

Estimated as oxygen. The specimen analyzed was not the pure mineral.

The cultivation of the peculiar green quartz, which always accompanies the tellurium ores was not according to Dr. Genth due to the latter, but to a silicate like roselite, containing vanadium.

Mining Around Auburn.

From the *Placer Herald* we clip the following in relation to mining operations in that vicinity: At the Centennial mine on Duncan Hill, a force of men are running a tunnel calculated to tap the ledge at a depth of several hundred feet, and afford, besides drainage, a convenient means of working the mine. The length of the tunnel will be about 500 feet, of which 160 is completed. Messrs. Spring & Holcom are working a new quartz ledge near the Eclipse mill, and though they are as yet down but a little way, they have a very encouraging prospect. Simons and Polster are also taking out some very fair rock from

a ledge on North ravine. The Good Friday, on which little has been done lately, has been started up by the Werry brothers. Mr. Hooper has recently leased the Shoo Fly ledge and is working it with good results. The Osborn brothers are at work on an extension of the Shoo Fly, getting a good prospect. The Trembling brothers have a shaft down near the old Bellevue mine, and by means of a whim are hoisting some good ore. On north and other ravines in the vicinity considerable sluice mining is being done during the present abundant water supply, and in most cases the miners in this line are getting fair wages at least. Chinamen with their pans, rockers or sluices can at present be found in nearly every little gulch in the hills; with free water these fellows can scratch out Chinese wages almost anywhere. Even in the little ravine on Nevada street, just at the edge of town, a Chinaman with pick and pan has been crevicing around for the last week or two, and it is not to be supposed he would stay there so long unless he found something. At various points on Auburn and Dutch ravines several gangs of Chinamen, consisting of from 10 to 15 each, are at work sluicing, though with what results cannot be ascertained, as whether good or bad, they always say "no belly good."

The Great Lead Deposit in Colorado.

The excitement of the day in Denver, and, indeed, in the entire State of Colorado, is the enormously rich deposit of argentiferous lead ore—chiefly carbonate of lead—in California Gulch, or Leadville, as the camp is now designated. This remarkable mineral deposit is certainly one of the most important yet discovered in this country. In some places the carbonate of lead containing from 10 to more than 1,000 ounces of silver to the ton, is dug up as sand, a sand which has long been known to prospectors, but, like the black silver ore of Lake Superior, was not recognized as of value till recently. Now the mountains, though covered with snow, are dotted everywhere in the vicinity of Leadville with indefatigable prospectors, some five or six hundred of whom have collected there from all parts of the country. The ores are very peculiar in appearance, some of them resembling iron ore, and they are found in some places in great abundance. Massive beds, as great as 20 feet in thickness, being already opened, and it is claimed that ore containing from 30 to 100 ounces of silver and a high percentage of lead can be mined and delivered "at grass" for \$3 a ton.

We gave in our number of January 13th a detailed description of these deposits. Their geological character is attracting much attention, and, as is invariably the case with very valuable mining property, they have fallen among—the lawyers.

The prevailing opinion is that the deposit resembles in many of its features the great Eureka-Richmond lode in Nevada, and that the recent decision, in which it was maintained that the whole mineral-bearing bed constitutes the lode, may be applied to this case. Though the lead thus far found has been as a contact deposit between porphyry and limestone, the correspondence referred to above classes them as sedimentary beds, of the nature of hog iron ore. The suits already in the hands of the lawyers will, no doubt, call for the best expert testimony that can be obtained, and there is a fair prospect that they will lead to full enlightenment of a most interesting geological question, and whatever these mines may prove to the miners, they will certainly prove a very "bonanza" to the lawyers.—*Engineering and Mining Journal*.

REMEDY FOR OBESITY.—According to Dr. Philbert, the waters of Brides in Savoy, which are very similar to those of Carlsbad, are very useful in the treatment of obesity. The purgative salts contained in these waters are sulphate of soda, chloride of sodium, chloride of magnesium, sulphate of magnesia, and sulphate of lime. To increase the effect, from 15 to 80 grains of sulphate of soda are added to each glass of mineral water. The quantity taken daily is four-fifths of a quart, divided into three doses, and the purgative effect is produced in two or three days. The course may last from four to six weeks. As an adjuvant to the waters, a vapor bath may be taken every day or every second day. Fermentaceous and saccharine articles of food are not allowed, and brandy, liquors, and coffee are interdicted; but the quantity of food is not limited, and a moderate amount of wine may be taken without harm. Muscular exercise is considered indispensable, and the mountains in the vicinity of Brides afford every facility for walking, where, in addition, this treatment may be followed by the grape cure.

THE GERRISH SMELTER.—This new style of furnace, lately erected by the Eureka Con. Co. is described by the *Sentinel*, as being provided with an air-jacket, precisely like a water-jacket, except that air is issued instead of water, and the inner lining, next the fire, is copper. That copper will not melt inside of a furnace was discovered by accident in New Mexico, and by a similar accident it was demonstrated that air was better than water for keeping the furnace from burning. The furnace now in process of construction is intended to reduce 24 tons of ore per day, and will fire up about the 1st of May.

Accountability for Mine Mismanagement.

Under this caption the New York *Mining Record* of recent date discourses as follows: The time has gone, by when men holding positions of high trust can be guilty of malversation or robbery, and not suffer the penalty, equally at least, with the lesser criminal whose open theft is less dangerous to the community, both as to degree and opportunity. In the city of New York, and throughout the State, recent judicial proceedings have shown that men holding high places and positions in politics and finance, whose real business was covert stealing, could be passed from the prisoner's dock to the State Prison or penitentiary as readily as the pickpocket, by vigorous and determined prosecutions which met with the approval of the community, courts and juries. Civil remedies were also applied to recover the stolen funds, and, if insufficient, were at once supplemented by stringent enactments to meet the need. There is no reason why California justice should be less efficient or prompt. Her people are noted for their manhood and fairness, which are none the less in her present organized condition of society than in her years of infancy, when her sparse and adventurous population respected mere signs of unprotected ownership, and Judge Lynch, by common consent and social necessity, adjudged the case of every thief.

It is of the highest importance for California, that the great mining interests which there take their germ should have the confidence and consequent facilities of the great financial and stock exchanges of the country and of the world. The recent establishment of a Mining Exchange in the city of New York is a sign of development of California in this branch of economy. But the financial and mining community of California cannot expect to command such confidence and facilities abroad, if the hideous misdoings of the mine directors and stock operators of that country, as we find them reported in their own journals, are to be suffered to pass without both punishment and enforced restitution. Criminal proceedings should at once be instituted, and stop only at the prison bars, while at the same time, civil proceedings should be had, accompanied by attachment of property, to recover for the stockholders the money extorted from them, under the name of assessments. It is shocking that in the case of the Justice mine, while it was producing large amounts, repeated assessments of money were levied on the stockholders, amounting in less than a year to nearly the present market value of the stock, and immediately diverted to the pockets of a few thieving scamps in their character of trustees!

All that is needed to promptly redress such wrongs is for the proper authority to take the initiative in a vigorous prosecution, and, if perchance through any clandestine alliances there should be an official stumbling block in the way, let public opinion, manifested through the action of individuals and the press, sweep the obstacle before it, as in the hurricane of the Tweed-ring prosecution here. It must be expected that such evil doers will have a certain amount of support, some from interest, either open or covert, others the mere stupid gazers who, from not being rich themselves, like to look at the riot of such wealth, and nurse the vague notion that some day they also may be drifted or tossed into it.

But the masses and the better portion of the community have everything to gain by the course we recommend; and whatever the prestige of the malefactor, it will fall to the earth the moment he stands unceremoniously arraigned at the bar of justice as any other thief, and the rest will prove as easy, if not easier, than the conviction of any less notorious and less grievous criminal. California owes a duty to herself in this matter, and we shall be disappointed if she fails of its prompt and energetic performance.

INCREASED LEAD PRODUCTION IN THE UNITED STATES.—One material result of the silver mining in Colorado, Nevada, Utah and Montana, has been to make this country the chief producer of lead as well as silver and gold. Up to 1876, the annual lead product of the United States ranged between 15,000 and 20,000 tons, chiefly from Illinois and Missouri—consumed for the most part westward of the Alleghenies—and consequently we were large importers of lead from England. But since 1873, the argentiferous lead ores of Colorado, Utah and Nevada, have turned out in 1874, about 20,000 tons of lead, 31,200 in 1875, 33,630 tons in 1876, and in 1877, about 45,000 tons with an increased production in Missouri and Kansas, to such extent that the lead product in 1877, is estimated at 73,000 tons. The price of lead was 8 cents in 1873, but at present it is about 4 cents. At 33 cents, exportations will be profitable, and in any event we ought to be able to monopolize the large China market.

"OIL SMELLERS."—They have "oil smellers" in the oil regions who profess to be able to detect the existence of petroleum 1,000 or 1,500 feet below the surface, by suspending an hermetically sealed bottle from a string close to the ground. One wealthy operator, referred to by the *Titusville Herald*, was fascinated last year by this species of locus ponens, to the extent of \$100,000 worth of dry holes.

MECHANICAL PROGRESS.

Locomotive vs. Horse Power.

An inquiry of no little interest is followed by Edward Appleton in a paper recently read before the Boston Society of Civil Engineers. He cited authorities by which a comparative estimate of locomotive and horse power can be made. A nominal horse power is that necessary to raise 33,000 lbs., one foot high per minute; an estimate first made by Boulton & Watt in selling their steam engines. Trautwine says that his assumption can really be carried out by a strong horse day after day for eight or ten hours; but as an engine can work day and night without stopping, while a horse cannot, a one-horse engine can do much more work than any one horse. Boulton & Watt meant that their one-horse engine could at any moment perform the work of a very strong horse.

Trautwine estimates that a good, average trained horse, weighing about half a ton, well fed and treated, can walk 10 hours per day at the rate of 2½ miles per hour on a good level road, and exert a continuous pull or tractive force of 100 lbs. On a level piece of good road, he estimates the traction at 60 lbs. per ton of load and carriage; so that the 100 lbs. of tractive force exerted by the average horse enables him to pull a load of 1½ tons at the rate of 2½ miles per hour for 10 hours per day on a good level road.

Trautwine gives the weight of a train, exclusive of engine and tender, which a good locomotive weighing 27 tons or 60,480 lbs., all on the drivers, can haul on a level railroad, at a moderate speed, say 8 to 12 miles per hour, as 1,458 tons, an estimate corresponding very nearly with the amount of work which the Baldwin Company guarantee their locomotives of similar size to perform. This locomotive then will haul a load as heavy as 878 horses could pull at the rate of speed assumed above for them on good common roads; but as it hauls this load at an average speed of four times that of horses, it is doing the work of 3,512 horses and is capable of doing it, not merely for 10 hours per day, but for nearly the whole 24. If the horses, however, were hauling upon a level railroad instead of a common road, it would not require so many of them to do the same work. Haswell gives a table of the comparative useful effect of the power of an average horse on a turnpike, a railroad and a canal. He rates the tractive force of the horse at 83.3 lbs., and says that a horse, traveling at the rate of 2½ miles per hour for 11½ hours per day, will exert a useful effect equal to 14 tons drawn one mile on a turnpike, 115 tons on a railroad and 520 tons on a canal. Making the hours of work and the tractive force agree with those of Trautwine, the average horse would draw 110 tons one mile on the railroad, or for his whole distance of 25 miles in 10 hours, he would draw 4 and four tenths tons. The locomotive above described then draws as many tons as 331½ horses could pull on the same railroad; and as it draws them at four times the speed of the horses, it does as much work in the same time as 1,325 horses.

A NEW FRENCH BALLOON.—The construction of a monster captive balloon at the Tuileries is said to be attracting much attention in Paris. A large wooden saloon has been erected for the sewing of the canvas, which is quite ready; not less than 100 girls will be required for about a month. The work of making the rope, which is almost finished, has been immense. The weight of the netting will be 3,000 kilograms, more than the displacement of the largest balloon in use. Besides the netting, the other ropes connecting the car, etc., will weigh 2,000 kilograms, and the large rope for mooring the balloon to the steam winding apparatus will be 3,000 kilograms. Experiments will be made to show that the rope can bear a traction of 50,000 kilograms, although it is not intended to ascend when the effort to move the balloon will exceed 12,000 kilograms. The real steam-power required will be 300 horse-power. The displacement of the balloon will vary according to its station; on the ground it will be 24,430 cubic meters, but floating at 600 meters in the air it will be 25,000.

ON THE USE OF EMERY WHEELS.—In an English lecture on emery wheels the following paragraph is found: A common delusion prevails that an emery wheel is a tool requiring neither skill nor practice, and it is left to any one who chooses to work it. The result of this same system, as applied to grindstones, has caused that article to assume the simply disgraceful appearance it often exhibits, untrue, worn into grooves and hollows, no one responsible for keeping it right, and the result utterly wrong. This system pursued with emery wheels is simply fatal to their chance of success. Mount an emery wheel on a suitable machine on a rigid foundation (do not put a heavy wheel on a light spindle), run it at proper speed, checking the calculation with a speed counter, keep it always absolutely true with the diamond (a tool not half used), press the work lightly on to the wheel—“crowding the work,” as it is called, heating more and doing less than gentle pressure; appoint a careful man to use it, and make him responsible for its condition, allow him a reasonable time to learn and understand a new tool, and one possessing very great and unusual power, and the result cannot fail to be satisfaction of

the very highest degree. But set an ignorant or prejudiced mechanic to a badly-appointed machine, with untrue wheels, and expect him to turn out as good work in an hour as he does by other means after years of training, and the result, of course, will be disappointment and condemnation of the unfortunate emery wheel. This may be considered an overdrawn picture; any manufacturer or traveler will tell you it takes place every day. Again, do not commence your emery work by attempting to do something you cannot do with ordinary tools. Get accustomed to the new system, and then apply it to the different jobs.

ENGLISH SHIP RAISING APPARATUS.—Iron describes the apparatus employed in raising the paddle-steamer *Edith*, sunk in Holyhead harbor on the 8th September, 1875, and to furnish an account of the operations. Various attempts were made to raise her up to the middle of 1876, but all failed; and it was not until eighteen months after the latter time (in December, 1877) that success was achieved. The depth of the water in which the *Edith* was sunk was 36 feet at low tide, and her weight was calculated at 800 tons. The lifting apparatus consisted of four large caissons, each about 59 feet long, by 15 feet wide and 15 feet deep, each divided into four compartments, and stayed inside with timber. The caissons were constructed of 3-inch plate, riveted to angle irons. Each pair of caissons was kept rigidly apart by wrought-iron girders. The five forward girders of the how cradle were plate girders. The eleven girders of the stern cradle, and the remaining six of the bow were plate for a distance of 18 feet at either end. To the ship's side the attachments were made by means of 39 steel wire-ropes, which were securely wedged into holes, five inches in diameter, cut into the ship's sides. The pumping was effected by means of two 10-inch centrifugal pumping engines. On the morning of the 4th of December the cradles were got into position over the wreck, and sunk till they drew seven feet of water. The wire ropes, each of which had been lengthened by the addition of two steel wire strops, four feet in length, were then handed up by the divers, and the eyes passed over the screw hooks, and an equal strain on each attachment obtained. The water was then pumped out, and as the tide rose the ship floated, the cradle having about four feet freeboard.

STEAM MOTORS ON STREET CAR TRACKS.—As Philadelphia has been widely noticed as a mover toward the use of steam on street car tracks, and as the dummies have been thrown out of use, it is interesting to note the reasons for their rejection. The *North American* of that city, in its issue of the 12th inst, says: President Baugh, of the Market street railway, was called upon by a reporter of the *North American* last night to ascertain if the rumor relative to the withdrawal of the steam dummies from the road was true. “Yes,” said the President, “we shall take them off Saturday (to-morrow), in compliance with a resolution passed at the last meeting of the board. At present there are but three dummies running—one Baldwin and two Mays. The Pyatt concern has left us, having been purchased and sent South. There are four of the Troy pattern that are out of repair and used up.” In reference to the cause for the action of the board the President stated that it was not from any failure of steam as applied to street cars, for the experiment had proved greatly successful, but because the company was compelled to keep as many men to look after three dummies as could attend to twenty-five. This fact added greatly to the cost of the running expenses. The dummies had only been abandoned for the present, he added, and if there had been ten to run on the road they would have been allowed to remain. Mr. Baugh said he favored the idea of motors, as the dummies, especially in the summer, are hot and smell badly. Then it was impossible to obtain a satisfactory rate of speed by running steam between horse power, although the board is satisfied that steam can be run successfully on the road.

A WAREHOUSE BUILT OF IRON.—A novel feature in building construction, due in great measure to the present exceptionally low price of iron, has been introduced in the erection of a large warehouse in Manchester, England, and which *Iron* describes as follows: The building, when completed, will cover an area of about 600 yards, consists of three fronts six stories high, the whole of which are constructed of cast iron. The main structure consists of vertical iron standards, one foot nine inches wide and one foot nine inches deep, the corices and strings are six inches wide, and are carried on stretcher beams running between the vertical standards, whilst the floors are carried by means of cast-iron columns, between which and the vertical standards are cast-iron girders, and the whole framework of the building is thus tied firmly together. The outside decorative features are in the Italian style, and the face of ornamented cast iron, is hung on to the framework and bolted, but in such a manner that in the case of the bolts decaying, the ornamented castings will still remain in place. The advantages claimed for this system of building are, with the present price of iron, its cheapness, the great saving of wall-space, and the large amount of wall-space which is procured. This class of buildings is a new feature for Manchester, but Mr. Synde has been commissioned to carry out other important work of a similar character.

SCIENTIFIC PROGRESS.

American Archaeology.

For more than a quarter of a century, the Smithsonian Institution has been engaged in researches concerning the antiquities of America. As the result of its efforts many important memoirs have been prepared, and published in its Annual Reports and in the Contributions to Knowledge; and the National Museum, in charge of the Institution, has become the depository of the largest and most valuable collection of American aboriginal relics in the world.

In continuation of previous effort in the same direction, the Institution contemplates the publication of an exhaustive work on American archaeology, with numerous illustrations. This will be accompanied by a series of maps, exhibiting by appropriate signs and colors the localities and distinctive characteristics of ancient mounds and earthworks, shell-heaps, cave and cliff-dwellings, masonry, sculptured slabs or carved images, inscriptions and rock paintings, graves and cemeteries, aboriginal quarries and salt works, caches or deposits of objects in large quantities, workshops or places of ancient aboriginal industry, ancient roads or trails, and reservoirs and aqueducts. To this end the Institution desires to collect from every available source, whatever is now known, or can be ascertained by special investigation, of the antiquities of North America; and it invites the co-operation of all. Prof. Henry, the secretary, has issued a circular in pamphlet form, which describes the classes of facts which are desired, and all who desire to aid in this interesting work would do well to apply for this circular to Prof. Joseph Henry, Washington, D. C.

ELECTRICITY FOR STREET LIGHTING.—The New York Sun gives an account of some experiments by J. B. Fuller, who proposes to light streets and dwellings with wire. It was in operation last week. A small steam engine furnishes the motive power for the machine, which is very simple, consisting of an armature revolving between the poles of a powerful electromagnet. A strong current of electricity is thus generated. Two electric wires are attached to the machine, and they convey the electricity to the various burners. Each of these burners consists of sticks of carbon separated by a piece of glass, which are attached in an upright position to the wires. The electricity is ignited by the application of an ordinary piece of material to the burners. The light thus produced is dazzlingly brilliant and very beautiful, so far surpassing the ordinary gaslight that the latter looks yellow and dirty beside it. Any number of lights may be supplied by the same wires, and Mr. Fuller has succeeded in so subdividing the current of electricity that any one of the lights can be extinguished without affecting in the slightest degree the other lights on the same circuit. This has not been accomplished before. Mr. Fuller says he can light buildings in any part of the city by extending his wire to them through the streets. He also says he can light the streets with electricity, and to prove this he has stretched his wires to a post on the sidewalk in front of the building, where he keeps a light burning every evening. This light is far more brilliant than any calcium light, and illuminates the street for a block. One of these lights would illuminate a whole block, and far better, too, than a dozen or more of street lamps. In lighting up a house, porcelain or ground glass shades are used for softening the glare of the light. The cost of production is very slight, much less than that of the ordinary gas.

THE BED-BUGS IN SWALLOWS' NESTS.—During a late trip to the western Territories, Prof. Leidy, while watching some cliff swallows passing in and out of their mud-built nests, was told that these nests swarmed with bed-bugs, and that people would not usually allow the birds to build in such places, because they introduced bed-bugs into the houses. He collected a number of the bugs from the swallows' nests, as well as from the houses. The latter were found to be the true bed-bug; the former the *Cimex hirsutinus*. The bugs infesting the hat and pigeon have likewise been recognized as a peculiar species, with the name of *C. pipistrelli* and *C. columbarius*. The habit of *C. hirsutinus* was found to be similar to that of *C. lectularius*, the bed-bug, in the fact that the bugs during the day-time would secrete themselves in the crevices of the boards, away from the nests. After sunset he had observed the bugs leave their hiding places and make their way to the nests. From these observations it would appear as if the bugs peculiar to these animals (swallows and men) did not reciprocally infest their hosts.

APIARIAN SCIENCE.—The Paris Agricultural and Entomological Society has applied for the grant of a piece of land in Mont Souris, for the establishment of a model apiary, and for the cultivation and exhibition of all kinds of plants most suitable for purposes of bee-keeping. The Municipality of Paris, to which body the ground in question belongs, have acceded to this petition on the sole condition that the whole establishment shall be open gratuitously to the pupils of all municipal schools of the capital at certain times and under proper supervision.

CALCULATING ASSAYS.—A correspondent sends the *Jeweller* the following very convenient method of calculating assays: “The method of calculation ordinarily employed and recommended by Fresenius, for reducing to troy ounces per ton the amount of silver obtained from our test assays, is complicated and liable to lead to mistakes on account of the amount of figuring required. We employ a method in the works here very simple, requiring no figuring, and also saving much time, which may not be known to all of your readers, and hence may be interesting and useful to some. This is based on the fact that there are 29,166 + troy ounces in a ton of 2,000 pounds. Now, we take a quantity of ore or hullion that represents a ton—say 29,166 + milligrams or 29,166 + grams, and divide it into three equal parts. For this purpose we have a weight or quad which is exactly counterbalanced by 9,722 + grams. The 9,722 + grams is the most convenient-sized button to make, and besides we make three assays at the same time; however, any fraction of 29,166 + may be used. The three weighed quantities of ore or hullion are subjected to the ordinary process of assay, keeping each in a separate cupel, of course. The combined weight of silver buttons obtained in milligrams will give the number of troy ounces per ton of 2,000 pounds. It will be observed that the silver may be calculated seven different ways—combined, separately, etc. This method may be applied in any case where any fire assay is used. We have used this process of calculation in the assay office of the smelting works here for some time, and find it very accurate, besides a saving of time and figuring.”

A NEW EXPLOSIVE.—It was stated at the last meeting of the Royal Dublin Society that a new explosive agent has been discovered by Professor Emerson Reynolds in the laboratory of Trinity college, Dublin. It is a mixture of 75% of chlorate of potassium with 25% of a body called sulphurea. It is a white powder, which is very easily prepared by the mixture of the materials in the above named proportions. The new powder can be ignited at a rather lower temperature than ordinary gunpowder, while the effects it produces are even more remarkable than those caused by the usual mixture. Dr. Reynolds states that his powder leaves only 45% of solid residue, whereas common gunpowder leaves about 57%. It has been used with success in small cannon, but its discoverer considered that its chief use would be for blasting, for shells, for torpedoes, and for similar purposes. Dr. Reynolds pointed out that one of the advantages this powder possesses, is that it can be produced at a moment's notice by a comparatively rough mixture of the materials, which can be stored and carried without risk so long as they are separate. The sulphurea, the chief component of the new explosive, was discovered by Dr. Reynolds about 10 years ago, and could be easily procured in large quantities from a product of gas manufacture which is at present wasted.

SPONTANEOUS COMBUSTION.—A writer in the *Mechanics Magazine*, London, in giving an account of his experiments with spontaneous combustion, states that he took a handful of cotton waste, soaked it in the oil to be experimented upon, wrung out the excess of oil, and then put it into a box along with some dry cotton. The box with contents was then heated to 175° Fah., and in 75 minutes the cotton saturated with hoiled linseed oil was found to be on fire. Boiled linseed oil and seal oil were found to be the most combustible; next in order came lard oil, which took four hours; raw linseed oil took four to five hours; rape oil and gallipoli-olive oil took a little longer than the last. All the oils thus named are ethers of glycerine. Castor oil, which is not an ether of glycerine, took two days to ignite spontaneously; sperm oil, too, does not ignite; and the petroleum actually stop the spontaneous combustion of the oils above mentioned.

NATIONAL OBSERVATORY.—The *Independent* says the movement for a new building for the National Observatory at Washington seems to make good progress, though it is not yet safe to predict what Congress will do with the bill to provide for its erection. The location of the present building is as bad as it can be; if for no other reason, on account of the malaria which has already broken down the health and threatened the life of most of the observers. But, aside from this, the old building no longer answers or can be made to answer the needs of modern astronomy. The plans for the new building, which have been sent for examination and criticism to most of the leading astronomers in the country, seem to be admirable, providing for all present necessities and for prospective wants.

FRENCH ACADEMY.—The last meeting of the Academy of Sciences of France was rich in practical reports and promising suggestions. M. Deschamps explained the details of a system he has devised for utilizing the motive power of the tides; M. Gaston Plante presented a memoir on the rheostatic machine, and on the different nature of sparks produced by positive and by negative electricity respectively; M. Toselli intimated his readiness to produce, artificially, large hocks of ice in less than two minutes; and M. Lecoq de Boisbaudran announced that he had succeeded in obtaining the chloride, bromide, and iodide of gallium in relatively considerable quantities, and that he had determined the atomic weight of the new metal as 69.9.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

DOUBLE STANDARD.—*Chronicle*, April 27: This mine at Monitor, has started up with two of Frue's concentrators, it being the intention to concentrate their ore and ship to San Francisco for reduction. The mine is being put in good condition. The mill runs live stamps and more will be added if the concentrators do their work to satisfaction and require it.

THE ADVANCE.—The crosscut in the north drift is in 22 feet in good ore. In the raise, to connect the winze with the air shaft, good ore is being found, some assaying as high as \$700 to the ton.

AMADOR.

ITEMS.—*Ledger*, May 4: The old Hite mine near Fiddletown, is to be started up with good prospects. The ore from the Phenix appears to be getting richer every day. Kendall's one-stamp mill above Volcano, is capable of crushing three tons of hard rock per day.

FRESNO.

RICH QUARTZ.—*Republican*, May 4: The Fresno mine, on Gold gulch, is developing a wonderful body of rich ore, and other mines now being opened promise well. As for quartz mining, this region is almost wholly new, though it has furnished good placer diggings for many years. This will evidently prove a very rich mining region when developed, and will add greatly to the wealth of the whole country.

INYO.

DEFIANCE.—*Coso News*, May 4: More track has been laid in the tunnel and drifts, additional cars provided, and better facilities generally perfected for the more rapid extraction of ore. Hauling of ore to the furnaces, and supplies of wood, coal, etc., are being received so that the two furnaces will very likely be started up again about the 15th instant, and will probably make a more extended run than the last one.

NEW COSO.—This company hopes to be able to start up again soon, if the miners will work at the rates offered and they can obtain cheaper freights.

MODOC.—Starting up has been a little delayed to get the water pipes in order. Furnace No. 1, however, was started yesterday morning, and is working very satisfactorily so far, and No. 2 will probably follow in a day or two.

MINNIETTA.—A number of men have been set to work preparatory to operations on a more extensive scale soon.

MARIPOSA.

VICTOR COPPER MINE.—*Gazette*, May 4: There are three different classes of ore in this mine—yellow, gray and black oxide; the yellow assays 30% copper; the gray from 36% to 42%, and the black 70%. A tunnel has been run in three hundred feet, and a shaft seventy-five feet on the vein, which varies from two to fifteen feet in width. There are also pockets in this ledge—harren in copper—that yield free gold. At the present time Mr. Quierolo the owner, is taking out about twenty tons of ore a day. With the necessary arrangements for reducing the ore, or even with better facilities for freighting, this would undoubtedly be a valuable property.

NEVADA.

ON THE RIDGE.—*Transcript*, May 4: The Eureka Lake company are washing on several of their claims with a full head of water and with great success, having never before taken out so much gold. Several other companies are washing in the vicinity of Columbia hill, the gold taken out there aggregating some \$50,000 per month.

THE BYRNE MINN.—Concerning this property now being extensively opened, Mr. Fred. A. Sacket writes the *Transcript* as follows: I leased a portion of this mine, with which Mr. Roht. M. Fryer is now actively associated, three years ago for hydraulicing, and with the most satisfactory result to Mr. Byrne and myself. I only washed about two acres and found 11 tons of float quartz on the rim rock that milled in free gold from \$65 to \$112 per ton. I think there is a gravel channel a short distance south of my working, and that a rich lode of quartz crosses the ground. This opinion seems to prevail among miners who have seen the ground and the character of the quartz taken from the washing. Mr. Byrne's refusal to extend the lease to me for a longer time, leads me to believe that he is aware that the lode is near by.

THE IRON CLAD.—Two crushings have just been made from this mine. The first was four loads taken from the croppings, which yielded \$42 per load; the second was eight loads taken from the shaft at a depth of 50 feet, which gave \$265.50, or a fraction over \$33 per load. The gold is of excellent quality, worth \$17.50 per oz., indicating that the mine is a valuable one.

THE OLD ROCK BAR.—An incline is to be put down 120 feet, at which point a new level will be opened. The water is now all out of the mine and "tributers" are taking out fine rock from the upper workings of the mine.

PLACER.

NEW DRIFT CLAIM.—*Dutch Flat Forum*, May

2: A new mining project is on foot in the Michigan Bluff district, headed by Wm. Leet, H. L. Van Emon, A. C. Bowen, and James Gould, of quite an extensive character. These parties have secured a location about four miles north of the Bluff, which they are satisfied is extensive and rich. It is a gravel claim which will have to be worked on the drift plan, and to develop it will require a tunnel of from 1,200 to 1,500 feet. This enterprise promises to prove an important one.

SHASTA.

FURNACEVILLE.—*Reading Independent*, May 2: Mining affairs here have not changed much of late. The result of the late run at the Afterthought is very flattering; the mine is being worked day and night. Mr. Crane has reduced wages at Copper City, and board being still high, the miners, provided they put in full time, clear but little during a month's work. Mr. C. thought it might affect wages in this district, but there has been no change yet. The Company feel well satisfied with their new works and can work to a good advantage at a very light expense. The Donkey has taken out some fine rock, and all now needed is good reduction works, and the hullion obtained would return a good revenue. They have a splendid ledge about four feet wide.

At Copper City they are driving the work along and will soon have a mill on the Extra at work. The company have a large hoiler at the depot for their mill, which weighs 8,000 pounds.

In the Flat Creek mining district but little is being done, except the building of an arastra by Conway, Smith & Co., which will soon be completed and a thorough sampling of the rock of all the mines there will be had. Good reports are expected.

The mines at Buckeye are about to close the season, and we are glad to know that all of them have made good wages, while many have done still better.

SIERRA.

ABOUT FOREST CITY.—*Mountain Messenger*, May 4: Mining news is not very plenty at present, as many prospecting claims have not commenced their summer work. The Oriental Quartz M. Co. are getting along nicely, and have some rich rock already where the first owners left off. They are getting the water out of the lower levels, and will soon be ready to start up in shape. There is every indication that they will have a good paying mine. The Golden Star company is steadily developing a fine body of rich gravel, and by another water season it will be in full blast. Other claims about as usual.

PLIOCENE.—The new pumping machinery and pump for the Pliocene mine was got to the works last week, and is probably in working order before this time. The weight of the new pump and fixtures is 5,800 pounds. The shaft was pumped dry with the old pump. The snow is still about six feet deep at the mine.

TRINITY.

GOOD YIELD.—*Journal*, May 4: The Weaverville D. & H. M. company took out \$5,700 at the Ward mine this week. The yield is considered satisfactory by interested parties, as it was only a partial clean-up.

DEADWOOD.—This is a lively camp. There are four or five good claims, which the owners are working by the old arastra style, and from what little they have done their results have been highly satisfactory. They are sensible in first thoroughly testing their claims before going to the expense of erecting expensive machinery for the permanent working of their rock.

TUOLUMNE.

THE YANKEE HILL.—*Independent*, May 4: Jas. Barron, with two other men, with his Giant, worked out a piece of ground here 316 feet long, 150 feet wide and 50 feet deep, in 28 days of 11 hours per day. He will have his elevator working soon.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, May 8: The shaft was shut down on Saturday last for repairs, which will take 60 days or thereabouts to complete. During that time only the California mill will be kept running on the ore, as the facilities for hoisting through the C. & C. will not admit of attempting to run more. Double shifts of eight-hour men are employed in doing the repairing to the shaft, the men changing every hour on account of the great heat. The ore stopes in the mine show no new features or changes of interest. The face of the south drift on the 1600 level continues in low grade ore. East crosscut No. 4 on the 1700 level is steadily advancing, the face in clay and porphyry. On the 1850 level the week has been mostly spent in timbering west crosscut No. 2, so that but little prospecting has been done. The south drift on that level is being again rapidly advanced. Sinking the C. & C. shaft is progressing at the rate of two feet per day, the bottom still in hard blasting rock and the flow of water quick and strong. The sinking was delayed two days during the week by necessary repairs to the hoisting engines and other machinery. These repairs have been completed, and everything is now running as usual.

CALIFORNIA.—Work in the mine has been very much interfered with during the week by the making of some necessary repairs to the hoisting machinery and shaft. This, along with the necessity for hoisting enough ore through the C. & C. shaft to keep the Consolidated battery mill running, has caused the shutting off for the month of all the mills ex-

cept three, the Brunswick, Morgan and Bacon. This will greatly reduce the regular monthly production of the mine, but will make no difference in the payment of the regular dividend of \$2 per share, as there is an ample surplus in the treasury for the making up of any deficiency that may occur. No changes of value to report in any of the ore-producing sections of the mine, the stopes showing well in every quarter.

OPHIR.—Sinking the winze on the east ore vein below the 1900 level is making steady progress. It is now down 78 feet. The vein of ore recently struck still shows on the east side of the winze, having passed nearly out of it. It is still very rich, and is about three feet in thickness. West of this ore the material is quartz of a good character, mixed with low grade ore, for several feet, and was again showing on the west side of the winze last evening, small veins of very rich ore. Sinking the main incline shaft below the 2000 level to reach and open up the 2100 station is making good progress. A drift east has been started on the California line on the 1900 level, to reach a point at which it is the intention to sink a winze to connect with the drift on the 2,000 level when they shall reach that point.

JULIA.—Day before yesterday a strong pocket of water was struck in the south drift on the 2000 level. This water is being hoisted to the head of the incline with the small giraffe, from whence it is hoisted to the surface by the pumps. It is only a pocket and probably will not last more than a day or two more. The foundation for the incinerator pump and pumps is all ready to receive the machinery, which was received at the mine last evening, and is being placed in position for use as fast as a full force of men can accomplish it. Everything will probably be in readiness for operation in three or four days more. The south drift on the 1800 level has reached to within 30 feet of a point directly under the Ward shaft. As soon as that point is reached an upraise will be made to connect with the bottom of the Ward shaft, which, when completed, will thoroughly ventilate both mines to that depth. The water strike has prevented the starting of an east drift on the 2000 level, with which it was the intention to follow up the drill hole recently run in that direction.

SAVAGE.—The main east crosscut on the 1600 level has been retimbered during the past week, so that but slow progress has been made with the north and south lateral drifts on that level. Everything being now in good working order, better speed must be the result. The pump boi-pit at the 2000 station is being repaired and a portion of the main incline is being retimbered. The water is reduced 25 feet below the 2100 station, the lowest point ever yet reached since the mine was flooded.

YELLOW JACKET.—The north winze below the 2200 level, is now down 215 feet on the slope. The bottom shows quartz of a favorable character, giving assays of from \$8 to \$10 per ton. The ground continues hard and dry. On the 2000 level the track is completed through to the Crown Point drift, and boxes are in place for carrying the water through from the Yellow Jacket to the Crown Point and Belcher drain shaft. The requisite stone is being received for the dam on the 1700 level, by the construction of which the cost of pumping some 50,000 gallons of water daily is expected to be saved.

OVERMAN.—The station at the 1600 shaft is fast approaching completion, and the excavation for a sump will soon be finished, so that a drift to prospect the ledge will probably be started some time during the coming week. A breaking of a spur-wheel of the hoisting engine at the head of the winze on the 1400 level has interfered considerably with the sinking winze, but that is now repaired, ready to start up again. Sinking the joint Caledonia winze on the south line is making good progress.

BELCHER.—The main north incline has reached the 2360 level, at which point a station is being out in preparatory to starting a drift eastward to prospect the ledge. It will be necessary after the station is opened to sink the main shaft some 30 or 40 feet deeper for a sump in case water should be struck.

SIERRA NEVADA.—No work has been done on the 2000 level during the past week, the entire time being employed in obtaining and setting up a new air engine on the 1700 level, in place of the one disabled. This engine was started up last night, and work was resumed in good earnest again this morning.

SILVER HILL.—The new cylinder and fly-wheel are in place and work well. Sinking the main incline is going steadily ahead, the bottom in good working ground.

BALTIMORE AND AMERICAN FLAT.—The northeast drift on the 1050 level shows no change of value during the week. The upraise to connect with the 800 level is going steadily ahead.

UTAH.—The south lateral drift on the 1350 level is now in a distance of 666 feet, the face in favorable vein matter.

LADY WASHINGTON.—The east crosscut on the 1150 level is being steadily advanced, the face in a very fine character of vein matter, containing some quartz and spots of ore. The north drift on this level is being pushed forward on the west side of the ore vein, the face of the drift cutting occasional lumps of good ore.

HALE & NORCROSS.—The pumps have been kept steadily running during the week, and now that the new donkey pumps of the Savage are in place and running, the pumps of the two mines are steadily gaining on the flow of water.

GOULD & CURRY.—Work has been resumed in the west drift on the 1900 level. This drift

is being cleaned out and repaired. Cleaning out and repairing the south drift on the 1900 level is making steady though slow progress, on account of the intense heat.

CON. IMPERIAL.—It was found necessary to sink the joint Alpha winze 30 feet below the 2400 level for a sump, which has been done.

BULLION.—The east crosscut on the 1840 level is being pushed ahead, the face still in quartz and vein matter of the most favorable description.

CHOLLAR-COMBINATION SHAFT.—Sinking the Combination shaft is going steadily ahead. The flow of water is still quite strong, but is taken up with the loose rock in the skeets without the aid or expense of any pumps whatever.

SUTRO TUNNEL.—Total length of tunnel last evening, 19,582 feet. During the past week the ground in the face of the header has worked more favorably, allowing of better headway being made. The heat is very great, but water does not interfere.

JUSTICE.—Daily yield, 120 tons of ore, keeping the Pacific mill steadily running. The ore stopes yield well, and continue to open up handsomely on the 1150, 1000 and 800 levels. The drifts to the south and east on the 1150 level are opening up some very good bunches of ore.

CALEDONIA.—Sinking the joint Caledonia winze below the 1400 level is making fair progress, the water coming in being hoisted with the rock. The east drift on the 1600 level is also making fair headway, the face in soft porphyry. The face of the main north drift on the 1600 level is still in favorable vein matter.

BEST & BELCHER.—Cutting out a station on the 1900 level in the joint winze on the Consolidated line is making good progress. The entire station is in quartz mixed with porphyry and clay that affords assays of \$3 to \$5 per ton.

AMAZON & GLASGOW.—The east drift on the 500 level is being pushed ahead. Some very fine stringers of quartz have been cut by this drift during the week.

UNION CON.—The joint east crosscut on the southern boundary line on the 1600 level is steadily advancing at the rate of three feet per day, the face still in vein matter of a very favorable character.

TROJAN.—Opening up the ore stopes on the 350 and 400 levels continues without interruption, the stopes looking well and yielding good ore, which is being shipped to the Vivian mill, on the Carson river, as fast as it is extracted.

ALTA.—The pumps are all working splendidly, and the water is reduced sufficiently to admit of a resumption of work on the 1300 level.

LEVIATHAN.—The bottom of the main incline, below the 600 level, continues in hard rock, with occasional streaks of softer material.

EUREKA DISTRICT.

MINING ITEMS.—*Sentinel*, May 4: Shipments of ore to Salt Lake have been resumed, and carloads of the article go forward daily. Buyers allow \$30 per ton for the lead this ore contains. There is one million bushels of coal burned and stored in the vicinity of Alpha and Pine stations. The Pope & Hamilton mine, at Secret canyon, in opening out finely. Sinking has been recommended in the Bald Eagle claim, and the shaft will be carried down a further distance of 150 feet immediately. Encouraging reports come to hand concerning both the Phenix and the Helen Mountain mines. There is a hint of further grand developments in the Eureka Consolidated mine, at a point below the eleventh level. There is no longer any doubt but that the Hamburg company have struck a bonanza on the 250 level. Explorations prove it to be an extensive and rich deposit. From 12 to 20 carloads of crude bullion, ranging from \$15 to \$35,000 in value, continue to be shipped from Eureka daily.

OSCEOLA DISTRICT.

THE OSCEOLA PLACERS.—The pay dirt here, says the *Ward Reflector*, is good, the belt being between three and four miles long and 100 feet wide. The deposit is 50 feet to bedrock in the center, with colors all through. At the bed rock from 75 cents to \$1 a bucket is common, and for at least six feet above the bedrock it will go from five cents to a hit. When the channel reaches the foothills it takes a jump-off and the gravel is increased in depth 20 feet. The want of water is what is particularly the matter with Osceola. The cost of bringing in an amount sufficient to meet all the requirements would not fall far short of a half million dollars. This outlay many with abundant means would hesitate to make. Nothing short of 500 inches of water will do. Besides the placers there is much wealth there in quartz veins.

PARADISE DISTRICT.

LOCALITY.—*Silver State*, May 4: This district lies east of Paradise valley and north of Golconda. The principal mine here is the Credit Mohliher. It was located in 1872. The owner has expended some \$9,000 in a shaft sunk 85 feet, and a tunnel run 185 feet. It is believed to be one of the best mines in the State. The vein is about four feet wide and ten inches of the lode assays \$1,000 to the ton. The ore is black sulphurets, of 55% gold and 45% silver. The vein lies in porphyry and granite. There is a small spring of never-failing good water at the mine. Mr. Sadoris, the owner requires the aid of some capital to further open this property and put up hoisting works. Any money so expended would be a good investment.

OREANA.—The smelting furnace at this place has been sold to the Pearl Co., who have put a force of men at work sinking a shaft on

a very promising vein of ore. General L. A. Buckner is developing a fine property in the Montezuma mine.

BIG PRIZE ORE.—An assay made at Gold Hill shows that the ore contained \$282.71 in silver and \$25.01 in gold per ton. One hundred pounds of ore sent to San Francisco and reduced by mill process yielded bullion at the rate of \$201.92 per ton.

RAILROAD DISTRICT.

COPPER MAT.—Eleven ton of copper matte have been turned out here. This matte contains about 80% copper, and is shipped to Baltimore. The ore is reduced to matte at the mine, by a new process, which is said to work well.

THE SULPHUR BEDS. Both the San Francisco and Nevada California sulphur companies are running their respective mines quite lively. The latter are about to put up steam refining works, which they expect to have running as soon as the machinery, which is now on the way to this mine, can be put in place.

WHITE PINE DISTRICT.

THE TUNNEL.—*News*, May 4: The Eberhardt tunnel has passed the 3,000-foot mark, and we learn that the header is again in vein matter, which gives encouraging hopes of this near approach to something more valuable. The tunnel is now in the vicinity of ground that proved very valuable near the surface, and its course during the next 500 feet will be watched with much interest, both here and on the other side of the Atlantic. The management entertain great hopes of the next two or three months explorations. The upraise in the drift is being explored with a force of 20 miners, and a large body of quartz is being penetrated, the assays from which continue to improve. The company's mill is undergoing repairs, and will probably be ready to start up in June. Teams have commenced hauling ore to the mill, and as the roads are good the work will be vigorously prosecuted.

REVEILLE DISTRICT.

THE GILA COMING UP.—The Gila mill will commence crushing ore about May 1st. There is an unusual quantity of rich ore in sight in the mine—far more than there has been at any time since the bonanza of 1875, that first introduced this name to the favorable notice of the stock-dealing community. The ore is of the same high grade as formerly, and the present outlook warrants us in stating that this property is bound to go to the front among the "outside" mines of Nevada. Stockholders may soon expect a resumption of dividends.

MUNCEY CREEK DISTRICT.

THE MINES.—Work is being done on several claims here, and generally with good prospects. In the Clipper, a 14-foot ledge has been cut. The ore is free milling, and has assayed as high as \$400 per ton. The Pledgman mine also being worked, yields ore that goes \$50 in silver, with 50% lead. The Champion has 40 tons of ore on the dump, and the Centennial 150. Their shaft is down 80 feet. At the Golden Gate mine they have had assays of \$11,000 in gold. Read has two claims, working \$70 to the ton, and 30% lead. He has a shaft down 60 feet. Wood and water are to be had in abundance all over the country and in the immediate vicinity of the mines.

Arizona.

THE OLD AJO MINE.—*Sentinel*, May 4: Active operations have been commenced at this locality. Eight men were at work last week, and the force is being increased to 30. Several parties have located mines there, each claiming to have the original, old, simon-pure Ajo. If specimens count for anything, they have all got good property.

THE WASHINGTON.—This mine has been sold to J. B. Haggin, of the firm of Haggin & Tevis, San Francisco. It lies about 75 miles southeast of Tucson, carries an ore body 60 feet wide by 400 long, and the average assays have been \$130 per ton. Two shafts and crosscuts in the ore body fully demonstrate its value. Water, wood and grass are plenty. The new owners have plenty of money, and propose to erect a 20-stamp mill at once, with power for 40. Large results are expected.

THE HACKBERRY MINE.—Advices from the above mine, under date of April 28th, represent the new mill as having been completed and in successful operation for 10 days. The mill was running very smoothly, and is pronounced a first-class job. The furnace (a Kewell) was chloridizing up to 92 per cent. Pulp assays averaging \$182 per ton. The mine was looking very finely at all points. About 1,000 tons of ore are already on the dump, and enough ore developed to supply the mill at least 18 months. A new set of hoisting works are now being erected, and when these are completed, sinking on the main shaft will then be continued. There seems to be no mine in the Territory of more promise than the Hackberry.

Colorado.

CLEAR CREEK.—*Miner*, May 1: A lack of water in the mines of Democrat Mountain threatens to seriously impede operations there this season. The drifts on the Lucky lode show it to carry five inches of ore that yields much zinc and about 150 ounces of silver to the ton. The Emma claim carries an ore rich in both the carbonate of copper and silver, the last run of which yielded for first-class 1,010 ounces, and 499 ounces for second-class. There is but little ore in the breast of the drift, but sufficient at different points in its length to indicate its high grade. The most of the leasers here are making

fair wages, those working on hire being also mostly employed.

Dakota.

BLACK HILLS MINING ITEMS.—*Times*, April 27: Many miners are leaving the upper camps to go prospecting, some giving up regular employment for that purpose. The late stormy weather, and consequent bad roads, are retarding mining operations very much in the Hills. A great number of valuable ledges have been located and partially opened off to the south of Deadwood, in the vicinity of Rapid City, Hayward, and other localities in Custer county. Much attention is being directed towards and a good deal of capital invested in that section of the country just now, a number of Eastern parties having secured properties there, will put up mills this spring. Meantime quartz operations are being prosecuted actively and successfully about Deadwood, which still continues the great center of business and immigration. By more recent advices it appears that the Father De Smet mine has just made a clean-up of 60 stamps for 26 days' run, resulting in seven handsome bricks, the lightest weighing over \$7,000, and in the aggregate very nearly \$50,000, the best result yet made on the mine.

Idaho.

THE MINING OUTLOOK.—*Avalanche*, May 4: Our mining outlook is improving, the chances being that this will be the most prosperous year in this part of the Territory seen for some time past. San Francisco parties are here examining our mines, with which they are favorably impressed, and if liberally met they will no doubt invest largely. A little pecuniary aid at this juncture is all that is required to render our mines profitably productive. Meantime work is being prosecuted on several claims in this vicinity with excellent results. The Golden Chariot is being prospected with the diamond drill. A considerable force of men will be put to work on the Belle Peck in a few days. Rumors continue to prevail of an effort to have the Poorman and the Oro Fino started up in a few weeks. At the Black Jack work is being prosecuted with vigor. There is quite a lot of ore out awaiting shipment, which will probably be crushed at the Elmore mill. The mine continues to look well.

Montana.

MEASURER COUNTY.—*Helena Independent*, April 25: A fine body of snow has fallen on the Belt range, to the great joy of miners and farmers. The drains in Avalanche gulch—with one exception—have not resulted as well as anticipated. In Magpie, work is still progressing with results much more favorable than heretofore. White's gulch miners are at work or making preparations to begin. The prospect for a remunerative season is good. Some important changes have been made in the ditches belonging to Wright, Hartop & Co., in Cave gulch, whereby the water is running on much higher ground than ever before, which will enable them to work all their ground to advantage. At Grewell's Bar the mines are being worked with very satisfactory results. Water is running in the Trout Creek ditch, but the supply is limited.

The Alta mine is likely to prove a bonanza, as during the past week the vein has widened out to six feet in thickness of very fine silver ore, the assays showing from 80 to 170 ounces of silver per ton. Two miners in running the tunnel during the past 12 days have put 50 tons of 100-ounce ore on the dump.

New Mexico.

LAS ANIMAS.—*Grant County Herald*, April 20: There are about 200 men in camp at Hillsborough, where 15 arastras are running. Yankee's mill, in full operation, consists of a two-stamp battery, four arastras and a pan and settler. Bennett & Neff will be ready to start up about May 1st with four arastras, and Judge Shaw's mill, when ready to start, will also have four arastras. This will make a total of at least 24 arastras. There are about 200 tons of good ore on the dumps. Some ore is being found here that contains 45 per cent. copper with much gold.

GEORGETOWN.—Many locations have been made at Ruby hill, the ore there assaying well. Pay pockets are also being struck every day about Georgetown, where much work is in progress, the mines looking well and some improvement in the town going on.

COPPER.—During the past two weeks Messrs. I. N. Cohen & Co. have received 46,965 pounds of copper from Clifton, Arizona, and have shipped to the railroad, during the same time, 20,772 pounds.

Oregon.

QUICKSILVER MINE.—*Sentinel*, May 1: The Emeline quicksilver claim has been bonded to San Francisco parties with privilege of prospecting and purchasing till Nov. 1st, at \$50,000. The property is already partially developed and gives evidence of large value.

PURCHASES, DITCHES, ETC.—The Sterling company has purchased the mining property of Thos. H. Gilson for \$2,000. Work on the Middle creek mines has been suspended for the present. The company expect to run a 15-mile ditch to Cedar flat, estimated to cost \$30,000, before resuming. Chinaman Lin made a clean-up at his mines on Applegate last week after a 24 days' run, and secured 134 ounces of gold dust.

Utah.

BINGHAM DISTRICT.—Salt Lake *Tribune*, May 4: Many idle mines are being started up here. Steamboat Co. are shipping ore to mill, with enough to keep it running for a long time. The Moscow has been running all winter and taken out ore that assays well, carrying also much lead. The Saturn, too, has been steadily at work, anticipating a strike soon. The Centennial, Wild Freuchman, Mohawk and Last Chance are all at work running tunnels, drifts, shafts, etc., with cheerful prospects, some having good ore bodies already opened up.

LEACHING OPERATIONS have been much retarded in the canyon by bad weather, but as soon as practicable, considerable quantities of ore will be manipulated by that process. J. P. Eastman & McEvoy have erected a tank and commenced work. The result is satisfactory, and their operations will soon be on a larger scale.

News in Brief.

MISS JENNIE LA FORREST has opened a Chinese night school at Oregon City.

REV. T. V. ROY, the reformed Brahmin, has been found guilty of bigamy in Montreal.

EIGHT THOUSAND soldiers will leave Spain for Cuba in the autumn.

DIPHTHERIA is prevalent to an alarming extent in the southern portion of Oakland.

THE Marysville *Appeal* is again complaining that the whole city is full of tramps.

THE British frigate, the *Shah*, has been ordered back to Esquimaux, V. I.

A VEIN of coal has been discovered on the Uridias place, a short distance east of Milpitas. THERE are 13 vessels carrying coal from Seattle to San Francisco.

EIGHTY-FIVE Chinamen have been set to work on the Olympia and Tenino railroad.

GEORGE WHITEHEAD, an old resident of Michigan Bar, California, was found dead in his bed at his home last week.

THE recent frost has probably ruined all the peaches, cherries and grapes in the vicinity of the Dalles.

THE March bullion product of the Eureka Co., was \$403,500. That of the K. K. Co., \$40,000.

THE rainfall last month measured 1.06 inches, and the highest temperature was 70°, and the lowest 44°.

GRACE, the only daughter of C. W. Clark, of Visalia, was almost instantly killed by being thrown from a horse last week.

THERE is a rumor that S. J. Tilden will live in Washington next winter, and give many brilliant entertainments.

IN view of the recent disturbances in Montreal, the government has taken measures to prevent the carrying of arms.

IT is estimated that the collieries of Picton county, Nova Scotia, would produce 1,000,000 tons of coal per annum.

THE San Jose *Herald* says that not less than 10,000 orange trees have been planted in the vicinity of San Jose this spring.

THE Helena, Montana, *Herald* claims that recent experiments prove that Montana is an admirable corn-growing country.

THIRTY-FOUR convicts were discharged from San Quentin last month under the Goodwin Act. There are 1,560 still left.

IT is now estimated that there will be 250,000 head of cattle driven from Texas to Kansas this season.

FARMERS on the west side of the San Joaquin river are, in places, estimating a yield of 50 bushels of wheat per acre. The average there was not five bushels to the acre last year.

CAPT. GRAY, formerly master of the bark *Mary Belle Roberts*, has been brought back to the city in an insane condition.

JAMES MCCLATCHY, editor of the *Sacramento Bee*, has announced himself as a candidate for delegate to the Constitutional Convention from Sacramento county.

THERE are about 1,000,000 operators engaged in the iron industries of the United States. The entire value of manufactured iron for one year is \$900,000,000.

A TIGHT-ROPE performer, while walking backward over a rope at Catasaqua, Pa., missed his footing and fell 50 feet to the ground. He will die.

SEVERAL of the canneries along the Lower Columbia are in operation, but as yet the salmon are running rather sparsely.

THE rent question is one of serious discussion in New York. Landlords are expected to come down much lower than they have ever done before.

THE colored people of Augusta, Ga., are working hard to make their cotton factory project a success. But the money comes slowly as yet.

THE Cheyenne *Sun* says that the loss of cattle for the entire winter will not exceed the average for the last ten years. Five per cent. is a large estimate.

THE Canadian Siamese twins, girls, are now over two months old, and thus far in perfect health. They are united by their backs above the hips, and have but one leg each.

THE police have discovered extensive illicit match factories, carried on by the Chinese in this city. They work at night, and never use any stamps.

A FAMILY named Robbins camped at the Dalles on their way to Palouse last week, which consisted of father, mother and 19 children, the oldest 21 years old; six pair of twins.

THE President has approved the Act prohibiting the coinage of 20-cent silver pieces.

THE shipments of grain from Omaha for the past six months amounted to 2,376,345 bushels.

THIRTY church to Central park in 20 minutes was this time made by the first train over the Gilbert elevated road, in New York.

JOHN REYNOLDS' California Chemical Works on the San Bruno road, was destroyed a few days ago. Loss, \$37,242; insurance, \$12,500.

THE number of Roman Catholic missionaries and teachers among the Indian tribes in the United States is 117.

THE nomination of George L. Smith, as Collector of Customs at New Orleans, has been favorably reported to the Senate.

MISS ISABELLA MCMAHON, sister of the deceased Irish exile T. B. McManus, died in this city last week.

PARKS, on trial for stage robbery at San Andreas, Cal., was convicted on the 28th of last month and sentenced to 18 years in the State Prison.

THE Meat Shipping Association at Reno is in full blast. An addition to the dry-house has been put on; other necessary improvements are also being provided.

THERE is a rumor that the Irish Fenians will collect in great force at Buffalo, for a raid on Canada, in the event of a war between England and Russia.

THE *Reno Gazette* reports that great quantities of trout are being caught by unlawful appliances at Camp 20, and calls upon the people to turn detectives and stop the business.

GEN. STONEMAN, of Los Angeles, California, has sold his oranges for \$18 a thousand on the trees. This dispenses with all expense or trouble of picking and shipping.

SEVERAL Indiana recently passed through Chino valley, on their way from California to New Mexico. They had with them a pretty large band of horses.

THE telephone established between San Francisco and Sacramento operates quite successfully, persons speaking at one end being distinctly heard and understood at the other.

THERE is a standing reward of \$1,500 for the arrest and conviction of the incendiary who fired the Santa Rosa Wine Manufacturing Company's building, on the night of the 9th of March.

ON Salmon hay (W. T.) there lives a hermit named Frost, who subsists entirely on dried salmon and cow's milk. He has a fine tract of land, and has a monomania that somebody is trying to jump it.

THE Sacramento Savings Bank has issued notice that it will no longer receive interest paying deposits because of the accumulation of money in its vaults faster than it can be lent on first-class real estate security.

THE Prescott (Arizona) *Enterprise* says: Hundreds of Mormons are coming into northern Arizona, from Utah, and settling up the mountainous country to the north and east of Prescott, likewise the Tonto Basin.

SINCE January 28th the police have arrested 256 Chinamen for gambling, 113 for visiting houses of ill-fame, 230 for cubic-air violation, 8 for carrying concealed weapons and 16 for obstructing sidewalks. The fines imposed and collected amounted to \$8,200.

IT now appears that the death of W. E. Bidleman, who committed suicide at Virginia City not long since, was not caused by domestic troubles nor anything of the kind. He was undoubtedly insane, and left an estate valued at \$30,000, free of debt.

THE high wind prevented the great balloon going up from Woodward's Gardens, May 5th, as intended. It was filled with 25,000 feet of gas, and Prof. Martin and Mr. Dam, of the *Post*, were ready to ascend as announced, but the gale put it out of the question.

MR. BENNETT, who owns a ranch near Resting Springs, in southwestern Nevada, became involved in a quarrel with the Indians, who attacked him, and in the row that ensued he shot and killed four of them.

CUBAN refugees continue to flock back to the island. Over 100 have returned from Key West. The rumors of the surrender of Maceo are received with much gratification. An easier feeling prevails among merchants and planters over the prospects of complete pacification.

JOHN MORRISSEY, the noted pugilist and gambler, and later in life Member of Congress from New York city, State Senator, etc., died last week. It is said his ill-gotten assets will not realize over \$30,000, and that the estate will not settle up the indebtedness.

THE salaries at the county hospital are as follows: Porter, \$30 per month; waiter, \$30; gardener, \$35; dishwasher, \$30; and the waiter on the women's nurses, \$35.

COLONEL BEE has received a letter from the Dairymen's Association, in New York, in which a proposition was made for 150 Chinamen to work at making butter and cheese.

THE License Collector is about to wage war upon clairvoyants and itinerant medicine vendors, in accordance with the amended law, which requires them to pay a license of \$100 each a month.

FORTY pounds of honey and two swarms of bees were taken from the roof of St Michael's church. The cupola of the Masonic hall, in Anaheim, which has been the abiding place of bees for some years, is expected to yield an immense crop.

MARK HOPKINS, Major Snyder, Julius Wetzlar, George O. Howard, W. S. O'Brien, all California pioneers and prominent among the wealthy, business men of the State, have died within the past three weeks.

How Steel Rails are Made.

The wide use of steel rails instead of the old style iron rail makes their manufacture a subject of interest. The subject is being discussed by the foreign mechanical institutes and inquiry is aroused as to the future of the methods now in use and the possibility of improvement. The following description of their manufacture is derived from a review of the subject in *Iron*: The rail-mill plant consists of the ordinary heating furnaces, a three-high roughing train, and a two-high reversing finishing train; the centers of rolls are 24½ inches apart. The roughing train is driven by a large horizontal engine, having a pair of steam-cylinders, each 36 inches diameter and 48 inches stroke, and a fly-wheel 25 feet diameter, and weighing about 30 tons. It is connected to the pinions by means of a pair of steel couplings, or "crabs," the fast one, or the one keyed on to the shaft of the engine, being secured to the loose one, or the one that receives the spindle end, by eight two and a half inch turned bolts. The spindle and hox between engine and pinions are also of steel. The pinions are of steel, having a width of tooth of 24 inches, and a pitch of six inches. The spindles between the pinions and the rolls are of steel and the hoxes of cast iron. The middle roll made of steel always runs in the same line as center of engine shaft, and the top and bottom rolls (the former of cast iron and the latter of steel) are adjustable to it. The housings are of cast iron, but the chocks, guides, guards and cramp bars are of steel; the hoxes are deep-sided, so that side-chocks are dispensed with. The roughing rolls are seven feet long in the body, and are arranged for 10 passes in such a way that one set of rolls will suit all sections of rails; they are never changed except when they require reducing or trimming up, or in case of breakage. In front of the rolls is a revolving roller drawn by means of friction gearing, and under the control of one of the men, by which the ingots are carried into the bottom grooves. Behind the rolls is a table 24 feet long and 10 feet wide, supported at the back, on the same level as top of the middle roll, by a pair of links; a second pair of links attach the front end of the table to the housings, in such a way that the table, in lifting, is drawn forward to the rolls radially from the fixed centers of those links, and for the first three or four passes the ingot is actually thrown into the top grooves without any assistance from the workman. The lifting is effected by a 10-inch steam-cylinder bolted to the sides of one of the housings, transmitting its power to the front end of the table through levers on a rocking shaft. The finishing train placed at the end of the roughing train, at a distance of about two feet from it, is driven by a pair of Ramshot's reversing engines, and have a pair of steam-cylinders, each 36 inches diameter and 54 inches stroke; the power is transmitted from the engine shaft to the shaft which drives the rolls by steel gearing having teeth of six inches pitch and 21 inches wide; the wheels are arranged as one to two and a half. The couplings or crabs, hoxes and spindles, are exact duplicates of those used in the roughing train. The finishing rolls are four feet six inches long, and are arranged for five passes, the working position of these holes being one foot above the floor line. Loose rollers running on the mill floor are used on both sides of the train for carrying the rails backwards and forwards to it, and a series of fixed rollers placed about 10 feet apart, driven by power, carry the finished rolled rail down to the saw under the loose rollers. The hot saw, three feet six inches in diameter, making 700 revolutions per minute, is placed at a distance of 66 feet from the rolls, but as the cutting level is on the mill floor, and the rolling level a foot above this, the rolling and sawing are carried on simultaneously. There are two hot banks, one on each side of the saw, which are filled alternately; by this means the rails are well hot-straightened before they are taken to the machines.

The mode of working is as follows: The ingots loaded on the mill hoxies in the Bessemer shops, red hot, are transferred as quickly as possible to the rail-mill furnaces, and after being heated are rolled off direct into rails, the number of lengths varying according to the length of rail required. Our usual practice is, three lengths for 20-foot rails and under, and two lengths for all above, up to 30 feet. The furnaces will take seven ingots in a charge, and turn out five charges per turn. The rails, after being rolled, are carried down from the rollers on the rollers described, straightened as far as possible on the hot bank, and afterwards finished in the usual manner.

THE TOWN OF WARD.—Concerning this mining camp, situated in eastern Nevada near the Utah line, the *Reflex* has this to say: Ward is at present very dull, but there is reason to believe that this will not continue. The future is now more hopeful than for many months. The first move looking to an improved condition of affairs will be the starting of the furnaces within a week, and the next, overhauling the old leaching mill, and converting it into a pau mill of the old tried and true pattern. When once both mill and furnaces are in operation, Ward will begin to look up again.

AS GOOD AS GOLD.—Currency is quite scarce, and brokers refuse to let it go under par in gold. Applications have been made for currency at the Sub-Treasury in exchange for gold coin at par, but there is no authority for the transaction of that kind of business, and of course the applicants are refused.

Rural or Suburban Dwelling.

The picturesque Gothic villa, shown in our engraving on this page, is a style which is fast becoming prevalent. It is designed by Isaac Hohbs & Son, of Philadelphia, and is something like numbers of handsome dwellings lately erected around the bay of San Francisco, and in other parts of the State. It is a graceful design, and the buildings which we have seen in the same style are fully as handsome as the picture. The shape and ornamentation of the building comport well with rural or suburban surroundings, and no one would think of building such a house unless he could give it handsome trees and tasteful grounds for its environment. This house may be placed on a foundation of rubble stone well pointed, or upon concrete, or upon the wooden base which is more common in this State. The superstructure is of frame, and the roof may be of slate or shingles. The principal rooms and hall of the first floor may be finished with black walnut, or with some of our handsome native woods. There are new and tasty designs for finishing with the natural wood, which are exceedingly neat in ap-

DESIGN FOR A PICTURESQUE GOTHIC VILLA.

pearance and inexpensive. It is estimated that a villa like the engraving can be well completed with modern appliances for about \$4,000.

The following will interpret the lettering upon the ground plan, and give the size of the rooms. First Story.—P, parlor, 14 by 16 feet, with bay window; D R, dining room, 12 by 20 feet; S R, sitting room, 14 by 15 feet; K, kitchen, 14 by 14 feet; H, hall, 6 feet wide; V, vestibule.

Second Story.—P C, principal chamber, 14 by 16 feet; C C (on the right), chambers, 10 by

12 feet each; U (on the left), chamber, 12 by 14 feet; B R, bath room; B, boudoir.

The floor above may be finished for a commodious attic, or made into two or three pretty sleeping rooms. Any one desiring more explicit information concerning the design which we present herewith, or other points on building, will be interested in the business announcement of the architects which appears in our advertising columns.

The enormous and unprecedented thickness of some of these coal veins, and the ease with which they can be worked, is astonishing.

First Story.

Second Story.

FLOOR PLANS OF GOTHIC VILLA.

12 feet each; U (on the left), chamber, 12 by 14 feet; B R, bath room; B, boudoir.

The floor above may be finished for a commodious attic, or made into two or three pretty sleeping rooms. Any one desiring more explicit information concerning the design which we present herewith, or other points on building, will be interested in the business announcement of the architects which appears in our advertising columns.

THE GREAT GERMAN IRON WORKS.—Krupp's foundry at Essen turns out in every 24 hours about 12 miles of rails, with tires, wheels, axles and springs in proportion, as well as 1,500 shells of various sizes and constructions. In one month 300 cannons are produced, and since 1874 15,000 have been made. The establishment daily consumes 1,800 tons of coke and coal, has 77 steam hammers, 8,500 workmen in the cast-steel department, and altogether 16,200 toiling men, women and children.

STANDS WELL.—One of the smelting furnaces at the Eureka Consolidated has run uninterruptedly for the past seven months, the longest period that any furnace has lasted since the building of the work.

Colorado Coal Fields.

Prof. Hayden, in his reports of surveys made in Colorado, testifies to the vastness of the coal resources of the San Juan region in Gunnison, Onray and La Plata counties, in close proximity to rich veins of the precious metals and the line of railroads yet to be built.

From an article in the *Ouray Times*, devoted to a consideration of the mineral resources of this section of that State, we compile the following facts: The coal measures show themselves wherever cut by deep canyons and at such points as the mountains break off from the vicinity of Mount Lincoln on the north all the way to the hank of the Rio San Juan South.

This as a general thing is an excellent bituminous coal as clean as anthracite; it leaves no stain on the fingers; produces no offensive gas or odor; leaves but little ash, no clinkers and produces no more erosive effect on stoves, grates or steam boilers than dry wood. This description will apply very nearly to all the specimens taken so far from various places in this great basin. A few miles south of Animas City, in La Plata county, are veins 22 feet thick and coal from these mines has been successfully

Open Market for Farm Produce in Oakland.

There is a good prospect that the enterprise for open and free marketing of produce, by producers, will be successfully begun in Oakland on Saturday May 25th. We are glad of it, because it promises well both for producers and consumers. We have often pointed out the culpable waste of time and money which is occasioned by carrying fruit and vegetables grown in Alameda county, across the ferry to this city, causing them to run the gauntlet of draymen, and commission merchants, and then packing them back for sale in Oakland, after their freshness is all gone, and the profits on their production have been well nigh wasted in transportation and commissions. We have often thought that many Oakland people must get a poor idea of the vegetable kingdom from the stale stuff which is dealt out to them by the large squad of Chinamen who furnish them with food which has lain from one to three nights in the city. This system should all be swept away. The Oakland people should have their food fresh from the gardens and orchards, and they should have much wider variety to select from than the basket of the Chinaman, or the counters of the corner store. Fruit and vegetables can be gathered after sundown, and be brought into Oakland in the early morning, even from the lower part of the county, and it would seem probable that the price which could be gained, and the saving of freights and commissions, would make the effort profitable to the producer.

The idea is gaining approval among the producers of the county. At the last meeting of the Executive committee in Oakland, Mr. A. D. Pryal, the traveling member, was present, and made an informal report. He has been over a portion of Alameda county only, and was on the point of starting for Contra Costa county. He displayed as the result of his work so far a list of over 100 farmers who had signified their intention to be present at the opening day of the market, May 25th, with their wagons laden with the various products of their farms, orchards and vineyards. Each signer set opposite his name a list of the articles he proposed to bring in. In these lists are fruits and vegetables of all kinds. Butter, eggs, cheese, milk, cream, buttermilk, poultry, pigs, lambs and calves; honey, domestic wines, hay, grain and straw, flowering plants, rustic baskets, chairs and tables, etc. Mr. Pryal says that the list at present represents from ten to fifteen million dollars in property, the signers being the most substantial farmers of the county.

The success of the market promises to be far beyond what the most sanguine of its projectors anticipated. It will not take many market days to convince the Oakland people the advantage of buying fresh produce direct from the producer's wagon. We shall doubtless soon see in Oakland, as we have often seen in the open markets at the East, a throng of frugal housewives in neat morning dresses, selecting their dinners from crisp, dew-laden vegetables, the sweet, new butter, eggs but a day's journey from the unknown, and live stock and poultry unstained by travel.

The plan to be pursued is quite generally known throughout the interested counties by the wide distribution of handbills, but it is so applicable to a score of our other large towns and cities that we give a brief description of it. The market is to be located on the east side of Broadway, south of Seventh street, and he held on Wednesday and Saturday of each week, and not continued longer than 2 o'clock P. M. Each vehicle occupying a stand in the market must be backed to or near the curb, and placed as near as may be at right angles with the line of the street, and a space of not less than two feet must remain unobstructed between each stand. A space of 6x20 feet must be allotted for each stand during market hours, the short measurement to be parallel with the line of the street, and the stand to include three feet of the width of the sidewalk next to and including the curb. The allotment of a stand in the market will entitle the recipient to a priority of right thereto; but such right will be forfeited by his failure to occupy the stand with marketable products for three successive market days, or by a violation of the provisions of this ordinance, or the rules for the government of the market; or forfeited for the day of the market by his failure to occupy the stand prior to the hour of 10 o'clock A. M. The name of the occupant of each stand must be exhibited in conspicuous letters, and fronting the sidewalk, during the time of such occupancy, and no longer.—*Pacific Rural Press*.

TYBO MINES.—Concerning this camp, situated in Nye county, central Nevada, the *Eureka Sentinel* of late date remarks as follows: This town is prospering and the mines in the vicinity are yielding largely, and looking better than at any time since their discovery. The furnaces were to have been shut down to-day for repairs, which operation will take from ten days to two weeks. There is a scarcity of coal at the camp, and the roads are in such condition as to prevent hauling. As there are over 150,000 bushels burned and ready for shipment stacked up in the neighboring mountains, as soon as the roads dry out, there will be a plentiful supply. After the 1st prox. the refinery will make fifteen regular shipments of refined hullion per month. The crude article is accumulating at the works, there being over \$150,000 worth on hand at the present time. There are but few idle men in the town and the outlook for the coming season is very bright.

A SULPHUR MINE IN IDAHO.—This property, which is situated about five miles from the soda springs, has been purchased by Mr. Pinedo, who has had it surveyed for the purpose of obtaining a government patent. The owner will erect refining works in the district as soon as the weather becomes settled, and will proceed to convert the sulphur into a marketable article. It is used largely in the new leaching process, and can be furnished here at half the cost of the imported article. The sulphur consumed in this country is brought from Sicily, and usually costs, laid down in Utah, about \$150 per ton, but this is a superior article, and will undoubtedly soon supplant the Sicily product. Several tons have been shipped from the mines to Salt Lake, and will be thoroughly tested for leaching.—*Salt Lake Tribune*

Salt in Nevada.

Notwithstanding the vast saline deposits found in many parts of Nevada, it appears that considerable quantities of salt are imported into that State. Some of these deposits consist of extensive beds of almost chemically pure muriate of soda. Sometimes this substance occurs in thin layers on the surface of the ground, and becoming quite dry in the summer, can be readily scraped into heaps, preparatory to being carted away. When found in this shape it is mixed more or less with dust and other impurities, so that it has to be dissolved and re-crystallized, which is done by first leaching it, and then flowing the brine into shallow vats, where the salt reforms under solar evaporation. For any ordinary metallurgical purposes these thin surface incrustations are often used as scraped up on the marsh. In all of the more extensive Nevada beds the salt over a large area occurs in a very damp condition, sometimes partially or wholly covered with water. In these localities the salt is taken up with long shovels, and thrown into wheelbarrows and thrown in heaps on a wooden platform, to drain off and dry, after which it is sacked up and hauled away, being sufficiently clean and pure for every purpose, even for dairy or table use.

In the early history of Washoe, prior to the construction of wagon roads over the deserts and mountains, and while freights were yet too high to admit of salt being transported from California, this article was packed from Teal's marsh, near Columbia, into Virginia on the backs of camels, a herd of these animals having been imported from abroad for that purpose. These marshes lie, for the most part, a long way from the principal mines and large centers of population, with sandy plains and mountain ranges intervening, in consequence of which the cost of getting this salt to points of consumption has proved so great that with railroad transportation it has often been found cheaper to import this commodity for the use of western Nevada than to obtain it from home sources of supply.

The various towns and mining camps in the central and other parts of the State have always procured their salt from the native deposits nearest their respective localities, and from a letter recently written by a party engaged in the manufacture of salt in Humboldt county, near the line of the Central Pacific railroad, and published in the *Silver State*, we infer that western Nevada will also get this article from domestic sources. Speaking of the facilities at command there for salt making, the writer remarks: We built some pretty extensive works last year, and now those have been enlarged. We have at the old works vats aggregating 4,200 in length and 58 feet in width. Besides these we have finished completely new works, one and a half miles from White Plains, on the railroad, containing 4,300 feet of vats, 53 feet wide. There is abundance of brine at both works for all purposes. A steam pump is partly used at the old works, while at the new works natural springs furnish the brine, which can be run all over the vats without elevation by pumps; so in all we have 8,500 feet of vats, of an average width of 55 feet, erected at a cost of nearly \$2,000. The new works, in system as well as construction, are the best on the coast, excepting none whatever. We made lots of salt last year, but as it was all engaged, we said nothing about it, not caring to get orders which we could not fill. Our salt for purity and cleanliness is unexcelled; in fact every buyer was surprised to see such an article. From the time of gathering the first crop, say the latter part of May, or perhaps a little earlier, we anticipate no trouble in filling all orders for milling salt, and we shall do all in our power to secure the northern trade. Works for grinding table and dairy salt will be built during the summer. Our salt has been tried in curing meats, and has been found equal to the best imported article. We will call on the merchants of Humboldt some of these days with samples, and hope to satisfy them in quality, quantity and price. By close study and perseverance we have overcome all obstacles, and by increasing the capacity of the works yearly will be able to supply the State with pure salt hereafter.

"THE POOR MAN'S MILL."—The phrase "poor man's mines" is one that has been much in use on this coast, being applied to that class of mines or diggings in which ordinary wages could readily be made, or which could be opened and worked without the aid of much capital. It was a happy phrase, and to the laboring man of small means one of pleasant significance. And now we are to have what has been aptly termed "The Poor Man's Mill," the device of Almarin B. Paul, of this city, the inventor of Paul's dry crusher and amalgamator. This machine consists of a sort of arastra furnished with shoes and dies. Concerning this invention the *Arizona Miner* speaks in a very appreciative manner, declaring that it will be of incalculable advantage to the poorer class of claim owners in that Territory, inasmuch as the cost of it, only \$1,000, will enable every one of them to procure a mill of their own. To accomplish this they will only have to get out and ship to Mr. Paul two or three tons of their rich ores, which will net enough to buy one of these mills, and, if the ores be extra good, also defray cost of its transportation.

USEFUL INFORMATION.

An Expert on Mad Dogs.

We have had abundant testimony concerning the nature and remedies for hydrophobia from scientific men. It is interesting, if nothing more, to read what a practical "dog catcher" thinks on the subject: "I do not believe in hydrophobia," said Special Detective Downs, of the Philadelphia police, who has charge of the dog-catchers' squad. "In half the cases reported as mad dogs the animals are not mad. Because a dog froths at the mouth it is not a sign that he has the rabies, and I do not believe that the cases reported in Port Richmond and down town within the last week, where so many persons were bitten, were mad dogs. The people who are bitten frighten themselves into the hydrophobia. If a man's system is in good order, he will not feel the bite so much as one whose system is disordered. I'd sooner be bitten by a dog than I would by a man. It is my opinion that there is more danger in the latter than the former. I've been bitten two or three times and have not gone mad yet. After the bites, when the blood would come, people who were standing around the wagon would say: 'Why don't you kill that dog?' Well now that would be foolish, to kill the dog after I've been bitten. The harm is done and nothing could prevent it then. I always make a poultice of salt and onion to draw the poison out of the wounds, and in a short time it is all right."

"About two years ago, when I first went out with the wagon, we caught a little sky poodle and placed him in the box. He bit every dog and frothed at the mouth, and we thought for certain that he was mad. One of the darkeys went into the wagon and tied him up. When he was let loose in the yard at the pound he bit all the dogs there. So Mr. Merritt, who had charge of the place, killed him and had him dissected. He found that the animal had a large gum-boil and a decayed tooth, which accounted for his strange actions. When dogs are cutting their teeth they become thin, refuse to eat, shun water, have convulsions, froth, and persons who do not know what ails them, believe they are mad. The trouble is people do not know how to manage dogs. A scare is raised about hydrophobia, the animals are put out of the way, and they gloat over the satisfaction of killing another mad dog."

Black Flux.

Edward Kirk, in his writings on the founding of alloys, in the *Iron Age*, gives the following paragraph: Black flux, as it is commonly called, is composed of 7 parts of crude tartar, 6 parts of saltpeter, 2 parts of common bottle glass, and by some a small amount of calcined borax is added. These ingredients are first finely pounded and mixed together, and then gradually heated in an iron pot or ladle so as to burn them together. Care should be taken to not overheat the mixture, and as soon as it is thoroughly melted and mixed together it should be removed from the fire and allowed to cool. After it has cooled it is finely pulverized and sifted, and is then ready for use. It has a great affinity for moisture, and should be protected against it by being placed in glass bottles and the bottles corked up until wanted for use. This is the most powerful flux that can be made. It is but little used in forming or fluxing alloys, but it is principally used by assayers in assaying of different kinds of metallic ores. In these assays the quantity of black flux used varies according to the quality of the ores, but the amount generally used is about an equal amount of ore and flux. The ore is first roasted and then finely broken up and mixed with the flux, and the whole is then rapidly heated in a crucible. If the flux does not make the slag sufficiently fluid to allow the metal to settle, a small amount of calcined borax is added, which makes the slag more liquid, and permits the metal to pass to the bottom of the crucible. The crucible is then removed from the fire and the mixture either poured from it or allowed to cool in it. After it has cooled the slag is knocked off with a hammer and a button of metal obtained. When using this flux the clay crucible, without either coal or plumbago, is preferred, for the flux is very hard on a crucible that contains either of these substances. Black flux is used by some foundrymen in melting the fine scrap sweepings from the floor, and dross and refuse from the crucibles, by melting these in a crucible with black flux. They obtain considerable amounts of metal from them that would otherwise be lost. In melting this refuse with black flux the common clay crucible should always be used.

PREPARED GYPSUM FOR BREWING.—It is, we believe, a well-known fact that by brewing with water containing gypsum a greater extract is obtained than by using ordinary water, as the gypsum facilitates the solution of the saccharine principles of malt, whilst at the same time it prevents the solution of albuminous matter, an excess of which is so detrimental to the keeping quality of beer. Beers brewed with water containing gypsum are also paler than those brewed with common water, and become bright without the use of finings. Gypsum is also largely used in the manufacture of sherry wines. The etone itself, however, is so hard that when used in its natural state in wells, it

takes some time to dissolve. We read in the *Trade Journal* that an English firm are manufacturing a gypsum preparation composed entirely of the purest sulphate of lime, and which is not objected to by the Excise. One pound of it is advertised as sufficient for 60 gallons of water, and the firm claim that it renders the latter equal in hardness to the best brewing waters at Burton-on-Trent.

FIBER FROM HOP PLANTS.—Proposals have frequently been made, says the *London Farmer*, to utilize the stems and other parts of hop plants for the manufacture of paper and various textile fabrics, but hitherto they appear to have been turned to little practical account. It is true the stems have often been employed on a small scale in making ropes and similar rough articles, and even carpets have been produced from the bleached fibre, but anything like a general utilization of the raw material has not, as yet, been attained. We learn from a *Wurtemberg agricultural journal* that a process has now been patented by M. Nordlinger, of Stuttgart, by which the fiber can be rendered sufficiently tractable to enable it to compete with flax on almost equal terms. The stems, etc., are boiled in water, to which soap or soda has been added, for three-quarters of an hour, thoroughly washed, and then again boiled in very dilute acetic acid. The fibers are now washed free, and dried, and when properly combed can be worked like other textile materials. They are said to resemble flax fibers very closely, and to be superior to all others in elasticity, softness and durability. It is much to be hoped that this process of employing the stems may prove a practical success, for at present, if the hop itself fail, the crop so tenderly nurtured is little less than a dead loss to the unfortunate grower.

THE DESTRUCTION OF MICE.—The Prague authorities invite earnest attention to the very serious proportions the plague of mice throughout Bohemia has assumed, and recommend the adoption of a number of measures whereby they hope to stay its progress. Among these are the protection of animals destructive to mice, such as fitchets, owls, hawks, jackdaws, and crows; suffocation by the introduction of smoke, or sulphur fumes, or water in the holes; deep plowing in autumn; the distribution of pills of iron filings and yeast made up with fat, or of wheat, barley, or other grain that has been soaked for 24 hours in a solution of oak ashes, or of little balls of meal and powdered glass, or, lastly, of small bits of sponge broiled in bacon-fat. They further gave warning that all this formidable arsenal will be of little service unless it be brought to bear before the mice have gained any considerable ascendancy, for their natural fecundity is so uncomfortably great that under favorable circumstances, a single pair may reckon on some 25,000 direct lineal descendants the course of a twelve month.

GOOD HEALTH.

The Effect of Carbonic Acid Gas in the Air.

The following extract from Mr. Briggs' article on "Moisture in the Air," in the *London Quarterly Journal of Science*, will be read with interest, as presenting a somewhat new view of the deleterious character of carbonic acid gas:

An adult in still life inhales each minute about 480 cubic inches of fresh air, and exhales 488 cubic inches of vitiated air, of which vitiated air about 4% is carbonic acid, and from which about 19% of the oxygen originally supplied by the fresh air has been abstracted; the original quantity of vapor in the fresh air at mean temperature and hygrometric condition (62° and 65%) will have been increased from 1.1 to 3.08 grains. Carbonic acid gas was made the scapegoat. It killed dogs at the Grotto del Cane, as was babbly exhibited to numerous travelers in Italy at that time—and both before and since, the same unfortunate dog serving to be killed to the satisfaction of admirers, that had been resuscitated the day before, after the visitors' backs were turned. It was heavier than air, and in some conditions of temperature would not so readily diffuse, but form a layer of distinct gas, like water beneath oil. Altogether it answered the conditions of hypobaseness, and it was decided to be vile, deleterious, poisonous. To be sure we devoured it in bread, and drank it in beer or aerated waters, but then the poison was to the lungs, not to the stomach! This theory found promulgators in the lecture rooms and advocates in the household 30 years ago, and has become to-day the traditional belief of the middle aged and elderly. If a room is hot and close from excess of temperature, or from a crowd of occupants, carbonic acid gas is the difficulty; if malaria is developed in a jail or hospital, or typhus or scarlet fever exist in the dwelling, carbonic acid gas in excess is the poison. "The gas is heavier than the air, and must necessarily sink to the floor, where all the air of vitiation will be found." These notions continue to have advocates and supporters to the present time, and the popular lecturer or writer gives a half assent to them to secure the favorable opinion of audiences or readers. But step by step, during the past 30 years, it has come to be perceived that the causes of disease are not to be found with organic matter, and carbonic acid has been re-

moved from its elevated place in ventilation, with the fullest admissions that in the quantities ever present in the living rooms, except by accident, it is quite harmless; and finally, its presence has been accepted as merely a measure of other more dangerous vitiations, in that, as it is a definite product of respiration, and as the proportion present in any room at a given moment can be ascertained with tolerable exactness, an indication can be derived thereby of the extent of organic vitiation with some degree of certainty.

Lecture on Corns.

In a lecture at the St. Louis Hospital, Paris, on hypertrophy of the epidermis, M. Guibout observed that, while in callosities the hypertrophy takes place at the surface, in corns the hypertrophied part becomes pyramidal, and takes the form of a nail, with its point directed toward the deeper seated parts. This sharp point, lodged in a kind of cupola, which exactly hoxes it in, has a tendency to penetrate into the substance of the dermis whenever the base of the corn is compressed. The portion of the dermis which is in permanent contact with the epidermic induration becomes inflamed and altered in character, its papilla disappearing, so that at last it becomes a true matrix, destined to form deep, new, horny epidermic layers, in proportion as the more superficial layers are eliminated.

Changes of the weather often give rise to great pain in corns, which has been supposed to be due to their hygrometric nature, which, by causing their enlargement, adds to the suffering. But, in fact, the exacerbations are less severe during the time that it rains than they are for some days preceding; and they are also met with when the weather is about to change from wet to dry. These painful exacerbations of the pain of corns are quite as remarkable and as inexplicable as are those of rheumatic pains. The sole efficacious treatment is excision, but care must be taken that this is complete. The summit of the cone must be cut down to, so as to entirely empty the dermic cupola. And then it is quite necessary to destroy, by cauterization, the inner surface of this cupola, namely the matrix of the corn, which will otherwise be reproduced.

The best caustic is sulphuric acid, of which we may deposit a drop, by a match or glass rod, on the excised part. If the corn recurs, the same processes of excision and cauterization must again be resorted to.

INFLUENCE OF EXERCISE ON THE LUNGS.—One of the conditions of perfect health is physical exercise. In its absence the whole system suffers deterioration and falls short of that development which is necessary to the vigorous action of the different organs. More than any organ, however, do the lungs suffer; and it is not difficult to explain why. In order that an organ should be well nourished, it is necessary that it should be abundantly supplied with blood, and one of the agencies which plays an important part in propelling the blood through arteries and veins is muscular contraction. The alternate contraction and dilation of the muscles forces the blood along the vessels. When a person is exercising vigorously, the respiratory movements become greatly increased, the air vesicles become dilated, the blood is propelled through the minute capillaries which constitute a large portion of their structure, and the lung tissue receives the nourishment which it requires, and which is necessary to its integrity and efficient action. From insufficient bodily exercise, then, the lungs suffer in two ways—viz., for want of sufficient blood to nourish them and for want of necessary expansion. The result is that the lungs, more frequently than any other organ, become affected in those who lead inactive lives. This fact makes it incumbent on all, and especially on those who have weak lungs, to spend a portion of each day in vigorous physical exercise. We mean by this exercise which calls into vigorous action all the muscles of the body; exercise which causes the skin to glow, the perspiration to start. Two hours of this kind of exercise each day is not too much; and it should be performed, when possible, in the open air. A celebrated French physician says that a person, to be healthy and strong, should exercise to the point of perspiring every day.

FOR SEVERE BURNS.—If you cannot obtain lime water ready made, take unslacked lime and pour water on it. When the water is drawn off clear, mix flax-seed oil with it until it becomes yellow and thick like syrup. Apply to burns at any stage, the earlier, however, the better. We publish this because we are confident it is the best application for severe cases, as well as slight burns. It should be kept on hand always.

FOR SMOOTH HANDS.—After washing and drying the hands, pour into one hand a few drops of good cider vinegar; rub the hands together, wetting the whole surface, both sides, and dry it. Practice this and your hands will feel smooth.

TO CURE HOARSENESS.—Heat well the whites of two eggs and two teaspoonfuls white sugar; grate in half a nutmeg, add a pint of luke-warm water, stir well and drink often. Repeat the preparation if necessary.

The Week.

Not for a year or more have we been able to announce so many indications pointing to an early improvement in our industrial and business interest, as seem to have presented themselves during the past week. Not that our material affairs have yet been restored to anything like a normal condition, this amendment being something that may reasonably be hoped for in the early future rather than a fact already accomplished. Our foundries are doing a little more work than during the winter, and it is expected that orders for mining machinery will come in more freely as the season advances. Other of our manufacturing industries are also fairly prosperous with improved prospects ahead. A slight increase in the amount of building going on keeps the saw-mills in the great lumber regions of the coast running at about their usual rate, the demand for lumber abroad not having been sensibly diminished. The mining interests of the coast are looking in a hopeful condition, even though the stock market continues depressed, and we are in hopes that the year 1878 will show even a larger bullion production than 1877, and we hope also that this bullion will come from many mines and go into many hands, instead of from few mines into few hands.

Drift Mining in Placer County.

Since speaking last week of the Pliocene channels that traverse so large a portion of the mining districts of California, and which are now being opened up at many points, we have obtained the following more full particulars of the claim belonging to the Blue Gravel Range company in Placer county, this being one of the most promising and accessible localities of the kind yet fixed upon for exploitation, and a description of which will convey a tolerably good idea of all the others.

The property of this company, which embraces an area of nearly 1,000 acres, is situated on the Forrest Hill Divide in the neighborhood of Todd's valley, being about 18 miles from Auburn station, on the Central Pacific railroad. It lies on the southerly slope of the ridge overlooking the South Fork of the American river, which runs in a narrow gorge more than a thousand feet below. Centrally through this tract passes one of the ancient gold-bearing channels, buried here to a depth of about 130 feet. Portions of the ground in this vicinity were formerly covered with rich surface placers, fragments of which still remain. There are also within the boundaries of the company's tract extensive banks of auriferous gravel, some of which might be washed to advantage by the hydraulic method and will most likely some day be so handled. The deposits resting in the beds of the buried river constitute here, however, the feature of peculiar interest and greatest value, these being also the most easily available for productive operations. As the section of the old channel owned by the company covers a linear extent of nearly 10,000 feet, having an average width of about 1,600 feet on the surface, they are supposed to have something like five or six million cubic yards of rich bottom gravel, which, according to all precedent, will yield at least \$1 per yard, the average elsewhere having been much higher.

As will be seen by an inspection of Doolittle's map of Central California, there are two main channels bearing southwest across the country here, the one coming in by Forrest hill and Todd's valley, and the other from Yankee Jim's, both distinguished for the large quantities of gold that have been extracted from them; first by drifting and afterwards by the hydraulic process. The group of claims worked along the Forrest hill branch have yielded as much gold, for the area of ground worked, as any other in California, the following being the product of some of the more noted of their number: The Independence, \$450,000; New Jersey, \$350,000; Deidesheimer, \$650,000; the Jenny Lind, \$1,100,000; mostly from the upper and poorer red gravel, and the Dardanelles, \$2,000,000 taken out of the lower stratum of rich blue gravel, the area of ground worked over in these several claims not having exceeded four or five ac. ea.

A short distance above the claim of the company we are speaking of, these two channels come together, the united channel thence pursuing its course through their ground to its lower end, where the old river bed finally disappears, having been eroded and swept away by the North Fork of the American. That this section of the channel, so deepened and augmented, is well stocked with gold, would be fairly deducible from its ascertained character above, had this fact not been established by actual workings and experimental tests. The Spring Garden claim adjoining this, on the north, has been opened and shown itself prolific in gold. The shaft put down by this company at a central point on their own ground, had also reached good gravel at the time the water broke in upon them, stopping further operations. The fertility of the channel here has, in fact, never been with the owners, mostly poor men, a question of such serious import as that of commanding the means for properly opening it. They know, as a matter of fact, that they have a section of the old Pliocene river here, and they know inferentially that it is rich in gold, but they have never been able to get it so thoroughly opened that they could reach and remove its contents.

Even in the flush times this was looked upon as a favorable site for a prospecting operation. As early as 1857 a company of miners started a tunnel from the bank of the North Fork with a view to developing the lower end of this channel. Having been disrupted by the Frazier River excitement, this company scattered the next year and never re-assembled, nor, so far as known, has any of them ever come back to prosecute the work or assert any claim to the ground, which has now for a period of nearly 20 years been in the peaceful possession of the present company or their predecessors.

After sinking a shaft to the depth of nearly 100 feet at the point mentioned, and being there prevented from going on by an influx of water too great for them to handle with their inadequate pumping apparatus, this company drove a tunnel from the lower end of their claim. After getting in several hundred feet they found the bedrock, pitching before them, showing that they were too high to bottom the channel. The tunnel was then carried down with the incline of the bedrock and a steam pump rigged for hoisting the water. But the machinery here again proved insufficient, forcing the company to once more suspend operations. This occurred several years ago, and, as the limited means of the company were by

these efforts exhausted, nothing further has since been done towards the development of this property.

Encouraged by the large returns these drift diggings are yielding wherever they have been effectually opened, the owners have concluded to make another attempt at getting their ground in proper shape for working. All that is now required to secure that end is the sinking of the present vertical shaft some 20 or 30 feet farther, and the transferring of the engine and pumps from the incline to the old shaft, there to be used for hoisting and pumping purposes, all of which can be accomplished with an amount of money so small that they ought to have no trouble in getting it.

In putting down this shaft the following material was penetrated: first, a body of cement 40 feet thick; then, a three-foot stratum of gravel; next, another mass of cement 45 feet in thickness; followed by six feet more of gravel; and finally a sedimentary deposit nine feet thick, underlain by a bed of large boulders and washed gravel, indicating close proximity to the rich stratum of blue gravel always found next the bedrock. All the gravel here intersected showed well in coarse gold, the best prospects being obtained from that nearest the bottom. With their claim in good working shape, the owners are confident that it would be netting handsome profits within 30 days after starting up.

The Relation of Science to Industry.

There has been a great deal written upon this subject; a great deal too much perhaps. There is always a certain amount of cant afloat among the people. Dean Swift used to wage bitter warfare against it. In those days it used to dress in priestly garments and assume a saintly air, now it goes about with a learned look and prates of this and that, as if it carried the cosmos under its hat and was not made of dust and ashes. But it is the same hollow pretender today that it was then. It is the same false prophet whether it stand behind the pulpit or reads a sounding paper before some learned society.

In these times we all know how common this scientific cant is, and we all know how to tell it. True science is a worker. True science thinks rather than talks. In most places there is more talking than thinking; there is more humbom than science. Again, true science is modest, not loud and ranting, it works in the silence, often in the dark; and, in short, science is truth-seeking, cant is self-seeking.

This loud-mouthed ranting of empty heads has done much to throw discredit upon science in the eyes of practical men. But let us remember the distinction we have made, and let us make the application until we have separated the wheat from the chaff.

We have said that science was truth-seeking. That is the kernel of the whole matter. Science in its broadest, widest aspirations seeks to take in the rays of light that stream in upon it from the remotest star in the universe to the nearest, minutest atom of earth dust, and to bring it all to a focus upon its camera. It seeks to reproduce in miniature the great universe about us, so that before its vision it can see accurately photographed each fact and factor in the great whole we call nature. This is science. It is not a mere aggregation of facts. That would be a chaos; but it is an arrangement of facts gained with infinite labor from the top of the Andes to the bottom of the deepest ocean, gathered by men young and energetic, and by men old and worn with years. It is an arrangement of facts so made that they show their natural relationship to each other, the forces at work among them, and the law that knows no breaking. This is what science is. It is our heritage from all the past. It is our store-house for all the future.

Now has industry no interest in this store of knowledge wrested by the work of the best minds that have ever come into existence? Let us see. What would industry be were it to become petrified? It would be what China is to-day. If then progress and improvement are necessary, whence can it come but from a wider, a deeper knowledge of the facts and forces about us. Where can one get that but from science? Here it is arranged, classified, labeled by the hand of some great master.

This is not very new, but it is very true, and we are all liable to forget it in the hustle of the workshop and the field. The practical man has got to look on scientific knowledge as all very well, but he does not see just how it bears on his work. He may agree about all this in a general sort of way, but he does not find the help from science that he ought. What is the result? Ask any one who has been to the Patent Office at Washington, and hear what he has to say on the endless host of men who have wasted years on the perpetual motion phantom. Stop to think for a moment of the wasted brains and hollowness that has been put upon this one mistaken effort. Think again of the additions that might have been made to our industrial resources, if science had directed this energy and capital. Science then is valuable to industry, first, because it avoids expenditure of energy in the wrong direction.

In the second place, science helps in suggesting new fields for inventive and industrial genius. Science, pure science remember, is only the

orderly arrangement of facts. It is not the application of them that is the field of the inventor and the practical man. But let us see what has come to industry from the pure sciences. We do not need to search for illustrations, but rather to omit, there are so many at hand. In the first place look at the work of Michael Faraday, a poor book-binder's apprentice, who devoted his life to the study of pure science without any idea but the love of truth. And behold the result of his labors in manifold applications of his discoveries in the laws of electricity that team on every band. His name like Franklin's is a name to conjure with. Again see how chemistry has made of coal tar dye stuffs that rival the rainbow's hues. But examples are needless. Let us learn the lesson. Let us send our inventors, our miners, our mechanics, our farmers, our children to learn not of loud-mouthed talkers, but of science what is and what is not a possible or a useful combination of force and matter.

Now from general principles to particulars. Here upon this coast we are finding ourselves after the hey-day of abundance just about on the same plane as the rest of the world. The cream has been skimmed, the honey eaten, the gold that grew has been gathered in and the rest of the world has the most of it.

We have now to take up the tools and work as they do if we would compete in the struggle for existence.

In this struggle every aid tells. The rest of the world has the aid of science. We must have it, too. On this coast we have our University that is doing much in this way, and our Academy of Sciences from which we expect much in the future. Besides these there are a few other scientific clubs and societies that are doing something to help on the work.

We need an industrial survey of the State to supplement the geological survey which has so unfortunately gone uncompleted. These institutions should have the attention and the assistance of all friends of progress. For from them alone comes the light that can save us from the communistic torch of ignorance and desperation.

And lastly, there is needed a journal energetic yet painstaking, stirring yet reliable, that shall bring together from far and near what help it can from science for the benefit of our industries. This has been and is the object of the MINING AND SCIENTIFIC PRESS.

For over 15 years it has worked nobly in this direction, against many discouragements. And from our experience of the past we have reason to hope for the future. We intend that in our columns the practical man shall find whatever appears in the scientific and technical journals of Europe or America that has any bearing upon the industries of the coast. We hope to be the first to record the progress of science and art here and abroad. We hope to add suggestions as to the best ways of overcoming the obstacles that are met with in developing our resources. And in furtherance of this, we desire that our readers keep us informed as to their especial needs and of the difficulties they meet with in their mining, metallurgical and other industries, that our work may be mutually advantageous. We believe that every man on the coast will find it to his advantage to have the PRESS where he can reach it.

A Large Silver Mill.

The Pacific Iron Works of this city, have recently entered into a contract with Mr. Wm. H. Cilley for the construction of an 80-stamp silver mill of the best pattern, for the celebrated Cerro de Pasco mines of Peru.

Mr. Cilley was a partner with the late Harry Meiggs in most of his railroad operations in South America, and he and his associates are now completing the contracts entered into with the Peruvian Government before Mr. Meiggs' death, among which was the construction of the Arroya railroad and the development and operation of the mines referred to. This road runs from Lima over the summit of the Andes, and is to connect with the fertile valleys of the eastern slope. It is now completed some 80 miles from Lima, leaving about 70 miles more to build to bring it to the above-named mines. This enormous mill will weigh some 600 tons, and a vessel will be chartered to carry it to the port of destination. As the machinery has to be packed on mules over the uncompleted portion of the road, it will all be made in sections, no piece exceeding 300 pounds in weight. We shall give farther details of the construction of this machinery as soon as practicable.

The Cerro de Pasco mines have been the richest and most famous in the world's history, having produced according to the Government records previous to the year 1826 the enormous sum of \$492,000,000, and were only worked to the depth of 200 feet. They are located in the heart of the Andes at an elevation of 14,000 feet, and some 150 miles east of the city of Lima, and are fully described in "Humboldt's History of New Spain," published in the early part of the present century.

JAMES HENDERSON DUFF, of Toronto, started last week to walk the distance of the circumference of the earth. He proposes to walk 40 miles each working day for two years, which will give him a day over what he requires to accomplish the feat. If he succeeds he is to receive \$10,000.

A New Work on Geology.*

It is seldom that a book comes out so entirely praiseworthy as this effort of Prof. Le Conte. In his preface he modestly disclaims any intention to make an exhaustive manual for the special student, but only to present the elements of the science in a clear way to the cultured and intelligent student. This and more he succeeds in doing, as we shall see.

The study of the life and development of our globe is one of the most interesting, and at the same time important fields to which man can turn his attention. It is interesting to the merely general student as a means of culture, but to the special student and the miner it becomes at once a matter of the very first importance. There has been a great deal done in the way of thorough geological work both in this country and in Europe by the most distinguished scientific men. But the records of their work have been only accessible in the files of scientific societies, scattered through long years, and frequently in foreign tongues, so as to be inaccessible to the ordinary reader. In the way of a comprehensive treatise upon the subject there has been nothing in the English language of any real value except the "Manual of Geology" of Prof. Dana, and the "Elements of Geology." But both of these books, especially the former, is rather a hand-book for the special student than an introduction to the science. The chief objection to the latter, apart from its arrangement in two large volumes, is the fact that its illustrations are chiefly drawn from European geology, thus putting an inductive study of the science out of the reach of the American student.

Prof. Le Conte felt this want in his course of instruction in the science, and was compelled to thoroughly rework the ground in a course of lectures for his students. This course of lectures, the result of many years of careful study and arrangement of the large mass of work which has recently been done in this science, is the subject matter of the present work. It has been long looked for, not only by his students, but by all interested in imparting instruction in this department. It is addressed to those who wish a clear and scientific account of the present state of the science without going into its minute, and also as an introduction to further study on the part of the specialist. It certainly fills this field better than any other book it has been our fortune to meet.

It is a handsome large octavo volume of nearly 600 pages. It is clearly printed, and is illustrated by over 900 excellent wood cuts taken from the original sources, and the whole work reflects great credit upon its publishers.

The arrangement of the work is something noteworthy. The Professor takes up first

Dynamical Geology.

He considers the agencies of the atmosphere, the water, the internal heat of the earth, and organic influences. These subjects are handled with a master hand, as we shall more particularly notice again.

Having fully developed this part of the work, to which are devoted 162 pages, he takes up

Structural Geology.

He considers the general form of the earth, stratified or sedimentary rocks, unstratified or igneous rocks, metamorphic rocks, structure common to all rocks, and denudation or erosion.

Under the head, "structure common to all rocks," he considers joints and fissures, mineral veins, mountain chains, their structure and origin. To structural geology he devotes 100 pages. Lastly he treats of

Historic Geology.

Or the history of the evolution of earth-structure and of the organic kingdom. In this, which occupies the remainder of the work, it is remarkable to see how interesting the Professor has made it by keeping the idea of evolution constantly before the mind of the reader. It serves as a thread upon which are strung a long series of most interesting studies, and, taken as a whole, it leaves a most convincing impression upon the mind of a reader.

We wish we had time to call attention to the manner in which certain subjects, usually slighted in works of the present nature, are presented. We refer to the sections on "ice and glaciers," "chemical agencies of water," "volcanoes," "geysers," "earthquakes," "coral reefs and islands," "mineral veins" and "mountain chains" for illustrations. All these are supported by facts from the latest observations, and, as presented, are brilliant illustrations of the inductive mode of reasoning, which it has been the peculiar privilege of modern science to develop.

We can cordially recommend this work alike to the general reader for profit and pleasure, as well as to the miner and special student, as something that will give him an excellent introduction to more special study.

There has been so much question as to Prof. Le Conte's position on the question of evolution that perhaps some of his friends might like to hear him on this point. We quote from an address of his delivered before the Chit Chat Club of San Francisco last November.

"First of all I wish frankly to acknowledge

that I am myself an evolutionist. I may not agree with most that evolution advances always *cum equo pede*. On the contrary, I believe that there have been periods of slow, and periods of rapid, almost paroxysmal evolution. I may not agree with most that we have in Darwinism, the final form, and in survival of the fittest, the prime factor of evolution. On the contrary, I believe that the most important factors of evolution are still unknown; that there are more and greater factors in evolution than are dreamed of in the Darwinian philosophy. Nevertheless, evolution is a grand fact, involving alike every department of nature; and more especially evolution of the organic kingdom and the origin of species by derivation must be regarded as an established truth of science."

In concluding this address there are a couple of sentences which we cannot resist the opportunity to quote. Speaking of the dogmatism which exist not only in theology but also in science sometimes, he says:

"The old is credulous of old ideas and skept-

Fig. 1

VITTI'S PATENT GRAIN TOLLER.

tical of the new; the new is skeptical of old ideas and credulous of the new. Both deserve the unsparring rebuke of all right-minded men. The appropriate rebuke for the old dogmatism has been put in the form of a bitter sneer in the mouth of Job—'No doubt ye are the men, and wisdom shall die with you!' The appropriate rebuke for the new dogmatism, though not put into the mouth of any ancient prophet, ought to be uttered. I will take it upon me to utter it here. I would say to those modern materialists—'No doubt ye are the men, and wisdom was born with you!'"

The Alexander Windmill.

A self-regulating windmill, which demands attention because of the exceeding simplicity of its mechanism and resulting advantages, is the Alexander mill, which is shown on this page. The engraving shows all the machinery there is about the self-regulating apparatus. The radical point of the invention consists in splitting the fan lengthwise, fastening the parts together by hinges and holding the movable fan up to its work by a coil spring. When the wind blows very hard the spring yields and the movable part of the fan turns back. In a gale of wind it rests at such an angle that the force of the wind upon it exactly balances that upon the fixed half then, and the mill stops. Half its surface is exposed to the force of the wind, and that half at an angle, leaving ample room for free passage of air. As the wind slackens, the spring draws the fan into place and the mill resumes its work.

We have seen numerous testimonials of those who have tested the mill and speak in its favor. M. M. Odell, of Sacramento, who has had one running through all the storms of last winter, endorses all that is claimed for it. Roht. Williamson, of the Capitol nursery, is very well pleased with his and said it would run four such pumps as his. Other points are made in letters of other users.

It is said that steam as a motor will be discontinued on the Philadelphia street railroads after nearly a year's trial, on account of the wear it causes the rails, necessitating their frequent relaying. Otherwise it gives entire satisfaction.

PROF. HILL is about removing his extensive smelting works from Black Hawk to Denver, to secure greater variety and better supply of ore.

Patent Grain Toller.

The annexed is an illustration of an improved mechanical grain toller designed for use in custom mills for the purpose of taking the toll accurately and without trouble to the miller. It may be readily adjusted to any proportion of toll as may be agreed upon.

A is a conducting tube, through which the grain passes down upon the slightly concave revolving disk, B. The latter is lowered by the pressure, and the grain gradually escapes between the lower end of the tube and said disk, and enters the annular casing receptacle, C. The tube, A, Fig. 1, is slightly increased toward the lower end, so as to let the grain down with less friction on the sides of the tube, and consequently to enable it to exert more pressure on the disk. The latter has a central tubular portion, which is connected by a comping pin in the shaft, D, which is rotated. The

Fig. 2

upper part of the tube is closed and a spiral spring is provided therein, so that the disk may freely play up and down while revolving. The disk adjusts itself to the pressure of the grain and automatically regulates the opening and outlet, according to the quantity of grain coming in at the top of the machine. The spring, by yielding, allows the disk to work as well

Alexander's Self-Regulating Windmill.

with an irregular as with a regular flow, and can be used equally well in tolling the grain from an elevator or from a hopper.

The casing, C, is arranged with two vertical partitions, one of which, E, Fig. 2, is movable, and is adjusted by a set screw, face plate, and index along the graduated scale on the exterior of the casing. The partitions, when adjusted to the proper distance, take up a certain fixed proportion of the circumference of the disk, and receive, by the uniform dropping of the grain over the edge of the disk, a corresponding proportion of the grain passing down the tube, A. This forms the toll agreed upon between the miller and the customer, and it is conducted through an exit spout, F, to a suitable receptacle. The main portion of the grain passes along the spirally inclined bottom to a second exit spout, G.

The first model machine made by the inventor has been in practical use in Vitti's Steam

Mills, at Union, Mo., over a year, without requiring any attention whatever, doing its work satisfactorily to both miller and customers. The toller is about 18 inches high, and the base about 10x5 inches. For further information address the inventor, Adolphus H. Vitt, Union, Franklin county, Missouri.

The Old Districts, and the Lessons they Teach.

In looking over the various mineral-bearing districts one is impressed with the generally healthful and hopeful condition of mining affairs on this coast. The first thing to be noted in the aspect of this business is the growing disposition to pursue it in a practical and economical rather than in a speculative and wasteful manner. The change that in this respect has been wrought within the past year or two is marked and general. Hundreds who, a short time ago, thought of nothing but investing in stocks, intent only on "getting points" and watching the fluctuations of the market, are now directing their attention to the other branch of the business, inquiring where are to be found the best openings for a safe and permanent investment, or the inauguration of a practical mining enterprise. Even those who continue to dabble in stocks speak of the calling in a doleful and despairing way, indicative of a greatly lessened assurance in its future. Confidence in the potency of mere manipulation is not nearly so great as it was. Operators are not heard to assert with the frequency and shameful sang froid of former times, that they know but little and care less about the actual merits of the mines themselves, this being an element that very rarely entered into their calculations. The character of the property whose shares they are handling is regarded as of more consequence now than formerly, and we predict that it will not be safe for dealers to so wholly ignore this consideration hereafter. Evidently stock operations must rest on a sounder basis, and be conducted in a more legitimate and business-like manner or they cannot go on.

But it was of mining in the field that we set out to speak about, and in this it is that the most obvious improvement has of late taken place, and it is an improvement that goes both to the modes of carrying on the business and to the mines themselves. As regards the latter, the evidence is found in hundreds of old and new camps all over the country. From every State and Territory along, and west of the Rocky Mountains, comes assurances that the bullion product of the present will exceed that of the past year, this excess in the case of some being very considerable. And this gain will not be restricted to these advanced figures nor confined to the present season. In most instances it may be expected to increase steadily, and to hold through a long series of years.

The countries that may most confidently be counted upon for an immediate and decided increment of their bullion production are Dakota, Colorado, Utah and Arizona, with some increase also in Nevada, California and Montana, and very likely Oregon, Idaho and New Mexico. What alone threatens to check production in Nevada is the interruption of ore extraction from the Cen. Virginia for a couple of months, and perhaps for a longer period, now determined upon. This will, however, be in part made up by the out-put of several other mines now coming into active production in that State.

What constitutes a specially encouraging feature of this branch of our subject is the great number of mining locations, and, even entire districts, that, after having struggled along for years with but indifferent success—some of them having been abandoned as hopeless—are now beginning to show signs of large mineral wealth, a few having already become active shippers of bullion. It is true, a majority of these old camps still remain under the cloud that so early obscured their horizon, and which from some of them may never wholly lift. Others, through the aid of capital and a more judicious application of labor, will, probably, show productive capacities equal to those which have already begun to yield the precious metals in notable quantity. In these localities that, after suffering a temporary decadence, have since begun to distinguish themselves in this particular, Nevada, Utah and Colorado are especially prolific.

All over these countries are camps that, starting out with brilliant prospects, and, enjoying a delusive prosperity for a brief period, declined afterwards almost to the point of industrial extinguishment, and so remained for a number of years, but which latterly have begun to recover, and promise soon to take respectable rank as bullion producers. At another time we will take occasion to speak more particularly of these resuscitated districts, pointing out the useful moral they convey to the practical miner, nearly all who had the courage to hold on here, having in the end fared well, some of them being already rich.

Nor disheartened at the failure of their first attempt, the Schively Bros. have built a new reverberatory furnace at Truckee, and are experimenting upon base metal ores, having already made a partial success.

The product of Hurst, Haggin & Co.'s Ontario mine in Utah for 15 months was \$2,299,800. The mine is better now apparently than ever before.

* "Elements of Geology." A text book for colleges and for the general reader. By Joseph Le Conte, author of "Religion and Science," etc., and Professor of Geology and Natural History in the University of California. N. Y.: Appleton & Co., 1878.

A Few Words About the "Mining and Scientific Press Patent Agency."

The Patent Agency of Dewey & Co. has been one of the most successful of the professional business establishments on this coast, being well and favorably known to inventors everywhere on this side of the Rocky Mountains.

Mr. W. H. Dewey, the oldest member of our firm, became interested in the office in 1852, and Mr. A. J. Dewey in 1853. The former is well known as an inventor of the journals belonging to the house, and the latter as the general business manager of the firm.

FORTY ACRE FARMS.

In offering the Reading Ranch for sale in subdivisions, I am disposed to accommodate the interests of all classes of desirable settlers, I therefore offer (besides large tracts) to sell farms (in favorable locations) of from 40 to 100 acres, at from \$20 to \$30 per acre.

EDWARD FRISBIE, ANDERSON, SHASTA COUNTY, CAL.

The Mining & Scientific Press,

is the leading mining journal in America, and it enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories.

OUR AGENTS. OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors.

- J. L. TILMAN—San Francisco.
- B. W. CROWLEY—California.
- A. C. KNOX—Pacific Coast.
- C. N. WEST—Santa Cruz, Monterey and San Benito counties.
- A. C. CHAMFON—Tuloso, Fresno and Inyo counties.
- EDWARD S. BAKER—Australian Colonies and Sandwich Islands.
- W. D. WHITE—San Bernardino and Los Angeles counties.
- J. W. A. WRIGHT—Sacramento county.
- B. E. LLOYD—Sonoma and Napa counties.
- E. M. DENNY, Oregon.
- H. E. HALLETT—Marin county.
- G. W. MCGREW—Santa Clara county.
- WM. M. BREWER—Black Hills, Dakota Territory.
- RICHARD ALDEN—British Columbia.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

Among the advantages gained by this holder are the following: It can be opened and closed quickly.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid knobs, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.

Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

ARCHITECTS.

We are continually designing Suburban and Rural Residences to meet the wants and means of all classes of people, always endeavoring to secure an effect of beauty on the smallest cottage, as well as the most costly residence.

Our charges for furnishing drawings of the building shown in this issue of the PRESS, all complete, with specifications, will be \$75.

By our economy in the construction of buildings and the proper selection of materials, we save far more money to the owner than our fees amount to.

Before choosing a home, a copy of Hobbs' Suburban and Rural Architecture should be obtained, a beautifully bound volume of 122 designs, which we mail post-paid, for \$3.50.

ICE! ICE!! ICE!!! Ice at \$1.00 Per Ton.

PICTET ARTIFICIAL ICE COMPANY, (Limited).

Room 51, Coal and Iron Exchange.

P. O. Box 3083, New York.

Steel Castings,

Solid and Homogeneous. An invaluable substitute for expensive forgings, or for Cast Iron requiring great strength. Send for circular and price-list to

CHESTER STEEL CASTINGS CO., EVELINA STREET, PHILADELPHIA, PA.

PARTNER WANTED.

Partner wanted for the country (increase of business the cause,) in an established Foundry and Machine Shop. Must be a good practical draftsman, pattern maker or finisher, first preferred. References required. For particulars address

BENJ. HEALEY, 402 Montgomery St., S. F.

HENRY C. EGERTON,

Mill and Mine Supply Buyer,

And Receiver of Ores, Bullion and Gold Dust,

Nos. 1 & 2 Brittain's Building,

(P. O. Box, 2068.) 109 CALIFORNIA ST. S. F.

S. D. BURBANK, OPTICIAN,

Dewey & Co. { 202 Sansome St. } Patent Ag'ts.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON, (Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachape Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains, Chiricahua, in the valley of Santa Cruz; Coronacion Peak, the Ariva Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Rock mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA,

Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

Working Capital Furnished for good Mining Claims, Assays, Surveys, Specifications and estimates of all kinds made.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1856, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

San Francisco Cordage Company. Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

 Biddeford,

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 83 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
 One man, per day.....\$ 3 50
 One man, per day.....3 00
 Wood, 1 1/2 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
 Cost of one ton of salt is necessary. 67 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

R. HOE & CO.'S

CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with Recent Improvements,
 Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Files are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

Office—202 Sansome St., N. E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby, facilitating their introduction, sale and popularity.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick Silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehnk's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, ALL free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento Valley. His advertisement appears from time to time in this paper.

MANUFACTURED UNDER A. NOBELS' ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS,

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. $\frac{1}{2}$ Triple Force Caps and all Grades of Fuse.

BANDMANN, NEILSEN & CO., San Francisco.

Mining & Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice free. Address, DEWEY & CO., Publishers MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, 202 Sansome Street, S. F.—1878.

THE EXPLORERS', MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 672 pages and 83 engravings. By J. S. Phillips, M. E. Price—cloth, \$10.50; in leather, \$12.50; postage 50 cents. Sold at this office.

Mr. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

The Speaking Telephone.

Great progress has been made in the introduction and application of the telephone to the practical uses of intercourse and communication since we gave a description of the Bell instrument some months ago. The workings of the instruments have been improved, and great advances have been made in methods of making them useful. Other inventors have brought out telephones which are coming into wide popularity because of their excellent qualities.

We show upon this page engravings of two telephones. One is the invention of Thomas Edison, who has achieved widest fame by his phonograph, which we expect soon to illustrate and describe. One of the main features of the Edison telephone is the employment of a carbon disk for the purpose of varying the strength of a battery current in unison with the rise and fall of the vocal utterance. He found that by vibrating a diaphragm with varying degrees of pressure against a disk of carbon, which is made to form a portion of an electric circuit, the resistance of the disk would vary in precise accordance with the degrees of pressure, and consequently a proportionate variation would be occasioned in the strength of the current. The latter would thus possess all the characteristics of sound waves, and by its reaction through the medium of an electric magnet, might then transfer them to a metallic diaphragm, causing the latter to vibrate, and thus produce audible speech. Our engraving, which is copied from one lately given by *Scribner's Monthly*, shows the arrangement of the parts of the transmitting apparatus of the Edison telephone. The carbon disk is represented by the back portion, *E*, near the diaphragm, *A*, placed between the two platinum plates, *D* and *G*, which are connected in the battery current as shown by the lines. A small piece of rubber tubing, *B*, is attached to the center of the metallic diaphragm, and presses lightly against an ivory piece, *C*, which is placed directly over one of the platinum plates. Whenever, therefore, any motion is given to the diaphragm it is immediately followed by a corresponding pressure upon the carbon and by a change of resistance in the latter, as described above. It is obvious that any electro-magnet, properly fitted with an iron diaphragm, will answer for a receiving instrument in connection with this apparatus.

Another telephone which is coming into wide use, is that invented by Mr. G. M. Phelps. The peculiar excellence of Mr. Phelps' instrument is said to consist in its distinct articulation, combined with a loudness of utterance that is not to be found in the many other forms which have been thus far brought forward. The form designed by Mr. Phelps is shown in our engraving. It consists of a polished case of hard rubber or rosewood with magnet coils and diaphragm inside. In connection with this telephone there is used a small electro-magnetic machine, contained in an oblong box, which is used as a call bell when the attention of a distant station is required. The currents which are generated by this machine by turning a crank, are conveyed by the conducting wires through the helices of a polarized magnet, or relay, and cause a hammer attached to an armature lever to vibrate against a bell, thus producing a violent ringing, sufficiently loud to be heard at a considerable distance from the machine. The points of description, which we have taken mainly from *Scribner's* detailed article on the subject, are of particular interest, because of the great numbers of this style of telephone which are being introduced in this city.

The use of the telephone in this city has been marked by the character of enterprise which usually attends the introduction of progressive inventions among our wide-awake people. The American District Telegraph Co. have furnished a large number of the instruments to private parties, and they have given the use of the telephone features which were original with them, but which from their plain advantages are now being introduced in other cities. Notable is the arrangement called the "central system." At their establishment on Sansome

street, near California, they have a telephonic department under the management of Mr. Sabin. In this room each wire from the distributed telephones centers. If the owner of a telephone wishes to communicate with another owner in any part of the city he signals or calls the central office, and his wire is connected with that of the other party. There are now 100 firms centering in this office and each one can thus, at a moment's notice, be put in communication with any one of the 99 others. Thus any firm can communicate with another as man would speak with man, as the message goes direct without even the intervention of an operator. When a firm is called from the central

EDISON'S TELEPHONE.

office they are told the name of the party who addresses them by the central operator, so there would be no chance for the telephonic impostor to impose on one another by calling wrong names. Each firm is furnished with a schedule of all the others which are in communication with the central office. As we have said, the manifest advantage of this centering idea is so great that the great cities at the East are thinking of following the example set them by the enterprising company in San Francisco.

CRANSTON'S HYDRAULIC WATER LIFTER.

Our coast is kept well abreast of the progress in the adaptation of electro-magnetism to common uses by our skillful home firms which make a specialty of this branch of work. Besides the American District Telegraph Company which we have mentioned, there is the California Electrical Works which is cognate in its sphere. The gentlemen in charge of this company are second to none in the country in their peculiar profession. In the application of important discoveries abroad and in original discovery and invention they are wide-awake and successful.

ON FILE.—We have several illustrations on hand which will shortly appear. Among them Pictet's Ice Machine, Root's Rotary Hydraulic Engine, Blake's Pumps, etc., the Phonograph, Edison, the inventor, etc.

Cranston's Hydraulic Water-Lifting Machine.

The accompanying engraving represents a hydraulic water-lifting machine recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Geo. W. Cranston. The main object of the machine is to go in combination with the Cranston Hydraulic Elevator for the purpose of setting or sinking in watery locations, where there is no drainage.

The elevator we have previously described and illustrated. It is simply a closed flume,

PHELPS' TELEPHONE.

into which is directed a hydraulic nozzle, the force of the water driving the gravel up hill. It is intended for working gravel deposits which lie too low to be worked by bedrock tunnels. It has been found difficult in certain places to get the elevator down to the proper level to work in mines; and in case of accident the elevator has been so covered with water that it was difficult to get it out for repair. In such cases the water-lifting machine, herewith illustrated, is very useful. The machine can also be used

bas a strong suction or draft when it is used drawing water or dirt. When used in combination with the elevator, as a sump or drain, the machine is generally placed at the bottom of the shaft, somewhat lower than where the elevator is situated, so as to drain everything into it, and can be driven by a branch pipe taken from the main pipe that drives the elevator. It must have a cut-off or gate to shut off the water when not in use. This machine is not required to run while the elevator is in operation, for the elevator is a sufficient drain; but, as above stated, is only required when the elevator is not running. The machine is small and light, easily set and moved, is not costly, and requires but little water to run it.

Two sizes are made; No. 1 requires from 40 to 80 inches of water to drive it and costs \$250. No. 2 uses from 60 to 120 inches of water and costs \$400. Further inquiries may be made at the Hydraulic Gravel Elevating Co.'s office, at Joshua Hendy's, 51 Fremont street, S. F.

Foundry Notes.

During the past two weeks business among the city foundries and machine shops shows some slight improvement, work at some of these establishments being more active now than for several months past. At the Pacific Iron Works they have a number of silver and gold reduction mills in hand. The 80-stamp mill being built here for the Cerro del Pasco mines in Peru, is being rapidly advanced, a large force of hands being employed upon it. At these Works they are also constructing a 10-stamp steam mill for the Golden State company of Arizona—nearly completed. The plant for a heavy sugar mill to go to the Sandwich Islands, a couple of large chloridizing furnaces for the White & Shiloh mine, Eastern Nevada, and two of the Howell furnaces for the Alice mine, Montana, have just been finished. Have also recently turned out one of the Gerrish air jackets for the Eureka Con. mine, Nevada, and a 10-stamp mill for the Constancia mine, near Guaymas, Mexico. They are executing many small orders here. The number of hands now engaged being larger than for 12 months before.

At the *Atma* they are busy on an extensive repairing job on the steamer *Great Republic*; also various jobs of this kind on flour mills, saw mills, etc. At the *Fulton* they are constructing 16 boilers, several of them of large size, some being intended for steamships and others for stamp mills, dredgers, etc. Having lately completed one of the new style of dredgers intended to operate on the rivers in the gold regions of this State, they are now getting up another of these machines, into which some needed improvements have been introduced. This machinery, aside from the boat on which it is placed for operating, costs from \$12,000 to \$15,000. They are building here a compound engine for a steamer to run between the larger islands of the Sandwich group; a five-stamp mill for the Extra mine, Shasta county; two steam launches—one for Victoria, B. C., and the other for Central America. Of the larger boilers being constructed here, six are for the Meiggs' Lumber and Shipbuilding Company, and four for the Star Flouring Mills, at Vallejo.

At the Golden State and Miners' Foundries several steam crushing mills, carrying from five to ten stamps each, are in course of construction; also two of Knox & Osborn's furnaces for the Sulphur Banks Quicksilver Company, and quite a large number of the *Fine* concentrators, a machine that seems to be coming into considerable use, and for the building of which this establishment has had many orders.

THE GILA MINE.—This is about the only property that for many years has served to keep any life in the old Revelle district, southern Nevada, and for a time this has been under a cloud, the fine ore body found in this mine several years ago having been exhausted, since which only exploratory work has been in progress here. The Gila, it appears, is in bonanza once more, with a much more promising outlook than ever before, the mine carrying a 3-foot stratum of ore, that assays \$348 per ton, with much besides of a lower grade. The company expect to resume paying dividends at an early day.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Esmeralda District.—No. 2.

Its Location, Past History, Geological Characteristics and Revival of Affairs.

In August, 1860, one of the most important discoveries ever made on the Pacific coast took place about 100 miles in a direct line south of Virginia. The location was for several years believed to be in Mono county, California, but the final survey threw it into Nevada, a distance of about three miles, at Aurora, Esmeralda district, after which the county was named, was organized on the 30th August, 1860, J. M. Braly, J. M. Cory and E. R. Hicks being the discoverers. The two former are residents of Santa Clara county.

There was no special excitement over the discoveries until the winter of '62-3, when the wildest sort of scramble ensued and raged for about 18 months, materially subsiding during 1864, by which time no less than 17 quartz mills were erected, 10 of which were still in operation. Three of these structures cost in the neighborhood of \$200,000 each—the Wide West and Real del Monte more particularly; the Antelope, a fine brick structure still remains to tell the tale. All the others of consequence being torn to pieces and carried away or scattered about the district in piecemeal. The town of Aurora, containing at one time from 6,000 to 10,000 inhabitants and many fine brick buildings, shared a like fate, hundreds of old chimneys and the like evidences of former prosperity marking the site formed at the junction of the ravines pertaining to Last Chance, Middle and Silver Hill, on which the bulk of the miners were located, Last Chance being the scene of wildest excitement. Mt. Braly is the holdest landmark and looms up south and west of Silver Hill to a height of near 10,000 feet, the town site being over 8,000 above sea level. The lowest estimate places the hullion product of Esmeralda district, first and last, at \$12,000,000, most of which came from half a dozen mines, of which the Del Monte, Wide West and Antelope were most conspicuous; the Utah, Ural, Empire, Cortez, Young America and others also contributing their share. The work of ore extracting on any scale worthy of note mostly ceased in 1865, but more or less crevicing or "coasting" was done up till 1868, when everything but the county seat and post-office was lost sight of by the outside world. This superficial mining resulted in leaving the old shafts and tunnels, that never had any systematic shape, in such a condition that anything like a satisfactory examination was out of question.

The formation of the district is as perfect as that of the Comstock, the surface croppings being more bold as well as richer, excepting that pertaining to Last Chance and Silver hills, where the displacement is considerable. Middle hill, which excited least attention during the early excitement, shows rich croppings and a formation that is generally regular. The "country rock" is hirsute porphyry, the quartz being gold and silver-bearing, the bullion rating at from \$5 to \$7 per ounce. The ore is free milling, and generally yields \$75 per ton on the average; much of it going up into the hundreds, and more or less even into the thousands. No doubt exists concerning the loss of millions of dollars through the ignorance of amalgamators during the flush times of Esmeralda, the metal floating off down the creek in the tailings, none of which were ever saved.

There were two leading causes for the decline and neglect of the district: ignorance of deep mining on the part of all interested in those days, coupled with the exhaustion of the surface deposits on the Comstock, and the extensive and costly litigation to which most of the leading companies became subject. Adverse claims were set up all about and overhead, until confusion worse confounded drove stockholders desperate, and the result was a complete stoppage of work and great loss. W. C. Ralston never gave up the idea of more thorough development, and in 1872-4 inaugurated what looked like a promising revival, but owing to his great operations and complications on the Comstock and somewhat tragic demise, the ultimate development of Esmeralda devolved upon others.

This brings the outlines of matters down to 1877-8, and following in the wake of the revival in Bodie, when a new departure was inaugurated which gives promise of great things. During Ralston's regime the Juniata company secured a patent for a large section of ground, chiefly confined to Last Chance hill, and including all the old Del Monte, Wide West, and the like croppings. Out of this patent the new Real del Monte ground was segregated (1,000 feet square), a company formed and new operations on the modern plan begun. A new three-compartment shaft, with hoisting works erected, capable of sinking it 1,500 feet was started last December. A depth of nearly 350 feet is reached, and the work is being pushed night and day. The location of this shaft is made with respect to the probable real line of the fissure, if any exist. The surface or middle hill is suggestive of three great fissure veins through the belt; but that there

must be at least one great source below from which these wonderful croppings come there can be no reasonable doubt for a moment. Should this great shaft, with proper drifts, crosscuts, etc., fail to open up another Comstock, that impression will still remain, and other shafts by the same, or other companies, will be sunk sooner or later. The new Del Monte company are well able to carry out a system of works throughout the district, which would test it thoroughly, but let them once strike an old-fashioned bonanza on Last Chance hill, at a depth consistent with modern explorations, and there will be no end to the capital and intelligence ready for any emergency. Things have reached such a state on the Comstock that all eyes are being turned to other fields, and no place outside of Bodie and within range of the Comstock, is so suggestive of big things as Esmeralda.

Aurora affairs are very much brightened up, and should the indications of rich deposits increase in the new shaft, as of late, there may be more than a ripple of excitement created ere the summer is over. The old houses of various kinds are generally furnished up and in demand, and certainly afford a timely shelter for a goodly share of the small army of adventurers attracted towards Bodie; Aurora being only 10 miles from that place. J. W.

The Remedy for Hard Times.

[Written for the Press by EDWIN BERWICK.]

"What's your remedy for hard times?" was an enquiry put by your correspondent yesterday to an intelligent neighbor.

"Economize!" was the laconic reply. Every one of course has some pet panacea for surmounting the difficulties that beset "the labor question," but I incline to agree with my neighbor, that the true remedy is the old remedy. "Go to the ant," thou laborer, "consider her ways and he wise, who, having no guide, overseer or ruler, gathereth her food in the summer and layeth up her stores in the harvest."

By the bye, let me protest, before proceeding further, against the arrogation to themselves exclusively of the title of "working men" by day laborers and hired hands. Are not twelve men out of every thirteen *working men*? Does it follow because a man has brains enough to find employment for himself, without looking to a "boss" to direct his powers, that he ceases to be a working man?

There are men totally unfit to follow the plow or carry the hod, all day, that work just as hard, and as honestly, as hod-carriers or plowmen.

One of your correspondents appears to think that machinery is making work scarce. I am bold to affirm that there is no superfluity of labor in the world. All that is needed is to direct labor into the proper channel. Machines will never pick strawberries or prune peach trees. So long as one acre of land in the world is only half cultivated, there is no need to talk of working half time.

If there is a surplus of mechanics in the towns, let them betake themselves to the foot hills, as you suggest. An acre in garden stuff will almost keep a family, and a cow well managed will yield \$50 per annum. Of course many will feel like fish out of water, hard put to it to make a living. There will be at the outset much failure and much privation, but when a man can get enough beans, corn, potatoes and greens, with a few eggs and a little milk, and hutter, with the prospect of fruit ahead, he ought to be able to wear through some years of close living.

Any man who has not the brains to mark out some line of business for himself, finds in the capitalist the very friend he needs. The laborer wants the capitalist, his occupation without the capitalist is gone.

What he does not want is that spirit of extravagance, which continually demands "flush times," and lavishes, on superfluities and vices, the money that should be prudently hoarded for "hard times."

That Paint of Ours.

EDITORS PRESS:—Your spicy article, written under the inspiring influences of new carpets and Averill paint, inspires a few thoughts in sympathy with your remarks. "Cleanliness is godliness." So says the good book, and I fully believe in the statement. A man's surroundings governs his every thought and many of his acts. The pure and the beautiful is elevating. Filth is depressing, and induces a state of mind antagonistic to the creation of high thoughts or noble deeds. We congratulate you on your altered condition, showing that you are blessed with wide-awake governors; may the editorials prove the virtue of paint and crystal skylights. No excuse now for dingy dishes being served up to the many readers of the RURAL.

I too am in the midst of renovation. Mt. Pleasant must keep its name good. So we espied the advertisement of the California Paint Company in the RURAL; we gave our order and a supply is somewhere on the way. This Averill paint is becoming popular for its intrinsic value. Not like many patent nostrums; it requires only to be used and seen to bring it into favor.

JOHN TAYLOR.

Mt. Pleasant, Tuolumne Co., Cal.

Coinage at Our Mints.

How the Silver Dollars are Made.

The law of February last, requires that from two to four million dollars shall be coined every month. As our mints have a maximum capacity of but three millions per month, this must be the limit, unless additional facilities for coinage are furnished. There will be no lack of metal even if the coinage should reach the largest figure allowed by law, and we depend wholly on home sources of production for a supply, as the mines on this Coast will turn out at least \$50,000,000 of silver this year.

There are two coining mints besides the one in Philadelphia; one in San Francisco and the other in Carson City; assaying and refining being done at Helena, Montana; Boise City, Idaho; Denver, Colorado; and at a few other points in the far West. The Philadelphia mint is capable of turning out about \$1,500,000 in coined money a month; the San Francisco mint, \$1,000,000, and the Carson City mint, \$500,000. The mints cannot, of course, be given over exclusively to the coinage of silver dollars. The subsidiary coins must be struck, and a certain amount of gold coinage goes on all the time. Gold is needed by the Government to buy silver with, aside from all other purposes. It is coined mostly in the form of double eagles.

Silver is sent from the assay office to the mint pure, or 999 fine, which is about as pure as can be. And when received is melted and alloyed with copper. Coin silver is 900 fine. After being melted and alloyed, the metal is cast into ingots which are assayed to determine whether it is exactly of the standard fineness, after which they go to the coiner and are rolled into strips, being annealed to prevent their becoming brittle. Next these strips are run through cutters which divide them into drafts of proper thickness for the coins; in which are run through a steam punching machine which cuts planchets the proper size for the coin.

These planchets are then carefully weighed, the light ones being cast aside and the over heavy ones filed down. This is a delicate process, and is done by women, the scales used being sensitive to one sixty-fourth of a grain. After the adjusting is finished, the next operation is the milling, which is done with a curious sort of machine. The edges of the coin are thrown up and grooved by this process. After cleaning with sulphuric acid the coins are ready for the die. The stamping is done on a screw press, both sides being stamped at the same time. The dies are cylindrical blocks of steel, upon which are carved the designs to be transferred by pressure to the coin. Two or three blows in the screw press, which is worked with a large wheel, secures a perfect impression, and both the obverse and reverse of a coin are struck at once. Machinery places the planchets between the dies, and afterwards drops the completed coin in a box. Two or three pieces of each coinage are reserved for the annual government assay.

The process of melting, refining and assaying gold and silver are carried on in the assay office, in this city, on quite as large a scale as at the Philadelphia mint.

Gold is always found alloyed with silver, and it is never found with any other alloy. To separate the silver from the gold, the hullion is hoiled in sulphuric acid, which removes the alloy; the gold is then rehoiled and reduced to a coarse powder resembling clay. Its purity is 998 or 999. The silver, mixed with copper, is run into vats, on a lower floor, and is purified and granulated, when it resembles pipe-clay. The granulated gold and silver are pressed into large cheeses in a hydraulic press. A cheese of gold, 12 inches in diameter and three inches thick, is worth \$20,000; a silver cheese of the same size is worth \$900. The vitriol and the weak acid are both sold for as much money as the original acid costs. Depositors receive their gold and silver separately at standard purity, 900. Pure metal is also sent to the assay office from the various refineries to be alloyed. From United States refineries silver is generally sent in large bars or cakes, and a small amount of Mexican metal is received in thin, irregular shaped pieces, called disks. The fumes from the vats and furnaces in the assay office are condensed and sold as weak acid. Only a small amount of gas escapes into the atmosphere, and although it is slightly offensive, it is not injurious. On the contrary, this gas is an excellent disinfectant, and acts upon dead matter rather than upon the living. The same precautions are taken to prevent loss in the assay office as in the great mints. The ashes, the sweepings from the floor, the crucibles and all the instruments which come in contact with the precious metals are washed and ground in a machine constructed for the purpose, and the stray particles of silver and gold are gathered together.

JORDAN CREEK MINES.—J. T. Galatin, writing from these mines, in Lemhi county, Idaho, says the quartz lodes are extremely rich. The miners ship their best ores to Salt Lake at a cost of about \$100 per ton. There is plenty of good milling ore in the camp that will not pay to ship. Mr. Galatin says: "A man with money could make a fortune by bringing a mill here." It was in this Lemhi country that the Mormons obtained the gold coined by them in early times.

A Cheap and Perfect Electric Light

Some two years ago, J. B. Fuller, of New York city, invented an electric machine for telegraphic purposes, and with which he continued to experiment with a view to the production of a more perfect electric light, an end that, according to the *Sun*, he has finally succeeded in doing, a very successful exhibition thereof having lately been made in that city. A small steam engine furnishes the motive power for the machine, which is very simple, consisting of an armature revolving between the poles of a powerful electric magnet. A strong current of electricity is thus generated. Two electric wires are attached to the machine, and they convey the electricity to the various burners. Each of these burners consists of two sticks of carbon, separated by a piece of glass, which are attached in an upright position to the wires. The electricity is ignited by the application of an ordinary piece of metal to the burners. The light thus produced is dazzlingly brilliant and very beautiful, so far surpassing the ordinary gas light that the latter looks yellow and dirty beside it. Any number of lights may be supplied by the same wire, and Mr. Fuller has succeeded in so subdividing the current of electricity that any of the lights can be extinguished without affecting in the slightest degree the other lights on the same circuit. This had not been accomplished before. Mr. Fuller says he can light buildings in any part of the city by extending his wires to them through the streets. He also says he can light the streets with electricity, and to prove this he has stretched his wire to a post on the sidewalk in front of the building, where he keeps a light burning every evening. This light is far more brilliant than any calcium light, and illuminates the street for a block. One of these lights would illuminate a whole block, and far better, too, than a dozen or more of street lamps. In lighting up a house, porcelain or ground-glass shades are used for softening the glare of the light. The cost of production is very slight, much less than that of the ordinary gas.

The Planchas de Plata.

The Planchas de Plata country is experiencing a mining revival. It lies a little south of the Arizona line, and west of the Tubac and Magdalena wagon road. The highest strikes have been made about 11 miles west of Agua Sarca, and Mexicans are pouring in there by the hundreds. They are just beginning to get over the paralysis of terror with which the Apaches had so long inspired them. This is why prospecting in that region has now been resumed after a cessation of nearly 100 years. Lorette, our Supervisor, was down there in 1869-70, and has ever since told big stories of mineral he saw there. Out of his party of seven men only two came out alive. That is why he did not stay there and make locations. Poorly armed Mexicans have had no business there at all, and have known it. When Mexico and Arizona were under the Crown of Spain, its soldiers beat the Apaches back and made prospecting safe. When the great planchas of virgin silver were found, the King decreed that all that kind of mining ground belonged to the Crown. Right there all prospecting stopped, and miners buried and concealed their mines. Just such decrees brought on the Mexican revolution in 1827; but by that time, and since, the Apaches have been supreme lords of the Planchas district, until within the last year or two. Mining is now possible there, and all the old traditions are being verified.—*Arizona Sentinel*.

Churning for Quicksilver.

A couple of Germans are said to be collecting quicksilver from the tailings deposited along the interior rivers, by the use of an iron rod about 10 feet long, the upper end so bent as to form a handle, while to the lower is fixed a piece of copper, 10 pounds in weight and shaped like a soldering iron, in each of the light faces of which are small cavities. In using this instrument the operators sink it into the tailings by a churning motion, which, agitating the quicksilver mixed up with the debris, causes it to flow towards the copper "hoh," entering the holes or adhering to its surface. The "hoh" is withdrawn frequently and the quicksilver and amalgam collected secured, when it is inserted again at another point near by. As there are large quantities of both quicksilver and amalgam lodged in some of these tailings, this method of gathering them may very likely prove profitable.

The Newspaper.

The Press.—Its Power.—A newspaper can drop the same thought into a thousand minds at the same moment. A newspaper is an adviser, who does not require to be sought, but comes to you without distracting your private affairs. Newspapers, therefore, become more necessary in proportion as men become more equal individuals, and more to be feared by tyrants.—*De Toqueville*.

The Press.—Its Use and Abuse.—Of such a powerful instrument of good or evil, we should be all anxious to extend the beneficent and check the baneful influence. If, therefore, you wish to have an honest press, you ought honestly support it.—*Archbishop McHale*.

MECHANICAL PROGRESS.

Bell Metal Alloys.

Edward Kirk in his articles on the foundry notes on bell-metal: One hundred and forty-four pounds copper, 53 pounds tin and 3 pounds iron, is said to make a superior bell. Iron, copper and tin do not unite well, if each is added separately to the other, but if tin-plate scraps are melted in a crucible together with tin, and then this tin and iron alloy added to the molten copper, it will unite readily.

Another alloy that is highly recommended is composed of 53.5 parts copper, 6.11 parts tin, 2.13 parts lead and 3.9 parts tin. This alloy has a good, sonorous sound, even if the mould is not thoroughly dry.

House bells are made of 4 pounds tin to 16 pounds copper.

Soft musical bells are made of 3 pounds tin to 16 pounds copper.

Common bell metal consists of 50 pounds copper to 15 or 20 pounds tin.

The silver bells of Rouen, France, consist of 40 pounds copper, 5 pounds tin, 3 pounds zinc and 2 pounds lead.

Too much tin causes bell metal to be brittle.

The gongs or cymbals and tam-tams of the Chinese are composed of 40 pounds copper to 10 pounds tin. To give these musical instruments their proper tone, they are plunged in cold water while hot, after being cast; cooling in water deprives the metal of almost all its sound. It is tempered and very slowly cooled, which imparts to it that peculiarly powerful sound.

If bell metal is suddenly cooled, it becomes less dense and hard, and is increased in malleability; but the tone of the metal is decidedly impaired, and bells ought never to be cast in damp moulds. When bells are cooled suddenly they should be reheated and tempered by cooling slowly.

ROPE DRIVING GEAR.—The *Textile Manufacturer*, of Manchester, England, says: "We have in these pages frequently called attention to a movement which is now assuming considerable proportions, and which in many districts finds great favor with mill owners and engineers. We allude to the system in which the power is transmitted from the engine to the shaftings by means of ropes. This plan, unlike the one in which the transmission is by means of leather belts, is one of comparatively recent introduction. The fly-wheel is made to serve as driving drum also; it is 22 feet in diameter, and weighs about 20 tons. It is grooved for the reception of 12 hempen ropes, each six inches in girth, six of the ropes being intended to drive one line of shafting, and six the other. The rope drums or pulleys on the shafting are five feet in diameter; the rims are made heavy and are grooved, as is the driving drum, but of course for only six ropes. The width of the grooves is 2.7-16 inches; total depth, 3½ inches; the radius of the bottom curve, one-half inch; and the inclination of the two sides to each other is about 49°. It will be apparent from these particulars that the ropes do not, even when pressed somewhat out of shape when doing full duty, rest upon the bottom of the grooves, but on the sides, and the wear is, therefore, at the points of contact. At the time of our visit, although the engine had been running more than 18 months, the ropes exhibited very striking signs of wear, the wear being tolerably uniform all around the section, thus indicating that the ropes do not, as some might suppose, present the same parts of their circumference to be continuously gripped in the grooves.

RUDDER POWER OF STEAMSHIPS.—A paper lately read before the British Institute of Naval Architects described an easy and effective method of ascertaining the rudder-power of steamships. Steamships, after being equipped, are usually subjected to certain trials to ascertain the diameter of the smallest circle in which they will turn round with the rudder in any given position; but this system of experiment is open to several objections. To obviate these the writer proposed a new plan, viz., pulling a boat into and retaining it in the wake of the ship, and from the boat observing with a sextant the angle subtended at the eye by two extreme masts of the vessel. The angle so obtained was constant, and afforded sufficient time for making the observations with accuracy. This observation having been made, at a preconcerted signal, the angle of the rudder may be changed, and a fresh observation made from the boat, which may be repeated as often as necessary. The diameters of the different circles can then be easily calculated from the data at hand.

COMPRESSED AIR AS A MOTOR FOR STREET CARS.—The Second Avenue Railroad Company in New York, says the *Railroad Gazette*, has been for some time experimenting with a car driven by compressed air, the machinery being the invention of Messrs. Hardy and James, two Scotch engineers. The results are said to have been so encouraging that the company is about to have several more cars built on the same plan. The machinery is said to be very simple, to occupy but little room, and to cause none of the heat and smell which is objected to when a steam engine is used. It also weighs much less than a steam engine and boiler of the same power.

DRIVING TUBE WELLS AT THE BOTTOM.—In the usual method of sinking tube wells much of the power available for forcing down the tube is lost through the great distance from the point at which the blow is necessarily given, but a very ingenious remedy has been provided by Messrs. Le Grand and Sutcliffe, of Bunhill-row, England. In constructing tube wells, according to their invention, says the *Mining Journal*, instead of sinking the tube at or above the surface by means of a monkey or weight falling upon the top of the tube or upon a clamp, the blow is given immediately above the point at its lower extremity by means of an elongated weight small enough to pass down the inside of the tube to be driven. This weight is raised and allowed to drop inside the tube by means of a rope, chain, rods, or other appliances, either lifted direct, or by pulleys attached to the tube itself, or by other suitable means. The weight, by preference, is shod with steel. In some cases they make the first tube about three feet long, with a clew bore slightly smaller in internal diameter than those to follow it; the driving weight is in this case packed with a leather cup or other sufficient packing to allow it to pass loosely down the tubes until it comes to the small or bottom pipe, where it fits more closely, so that when raised it produces a partial vacuum, which not only obviates any compression of air that might take place during the fall of the weight, and so partially impede the force of the impact, but, on the contrary, accelerates the fall and increases the effect of the blow. Instead of striking the blow at the bottom of the tube, a stout collar or ring, to form a ledge inside the tube, may be placed at the first joint—say two or three feet from the bottom of the tube—upon which a cylindrical block of iron or steel can be laid to receive the blow of the monkey or driving weight. This block is provided with a keyhole, so that it can be fished up and lowered by a key attached to a rod.

SAND AS FOUNDATION MATERIAL.—One of the best possible foundations is sea sand; at least so long as it is not interfered with. The man who built his house upon the sand was not quite the lunatic that many worthy people suppose. Under ordinary circumstances, his abode was just about as secure as his neighbor's upon the rock. Unfortunately, however, one stormy night an unexpected flood came, and next morning his want of forethought was made apparent. So long, therefore, as sand is uninfused by running water it is safe. Sink, however, a well near, and you at once undermine its security. Nothing is more treacherous than sand when allied with water. In harbor works heavy piles (driven many feet into the sand) lifted and thrown up high and dry on the adjoining beach by a single night's gale. Sand has many curious properties. Its incompressibility is well known. A paper cylinder filled with sand will sustain a surprising load. One of the Loudon Polytechnic experiments, a few years ago, was to bury an egg in sand within a sort of enlarged cupel mold, and then to pound the die vigorously; on afterwards emptying the sand, the egg was found uninjured. The ancient Egyptian engineers, it is surmised, must have used sand extensively for some purposes for which we employ timber. Mr. Dixon supposes Cleopatra's Needle, and the various monoliths of similar character, to have been raised into a vertical position by means of hillocks of sand.

TALC AS AN ANTI-INCURSTATOR.—Recent experiments made in France by Mr. Michand and Mr. Lory, of the Grenoble departmental laboratory on the use of finely pulverized talc as an anti-incrustator, have been confirmed by practical test and favorably reported on by Mr. Marie. Talc was tried by him in locomotive and stationary boilers at Rhone and Mont Cenis where the water used makes a very considerable deposit. Mr. Marie reports that new boilers or such which had been cleaned were preserved from scale during the entire time when acted upon by the talc, but as soon as its use was discontinued a scale was produced at the end of less than one month. The talc acts entirely mechanically, presenting by its foliated structure a large surface for the deposit of the salts, and sliding down the sides of the boiler with greater facility than the clay sometimes used for the same purpose.

LONDON UNDERGROUND RAILWAYS.—Some interesting facts concerning the operations of the Metropolitan Underground Railway of London are contained in the half-yearly report of the company, recently issued. The length of the main line is 8 miles and 10 chains, and of lines partly owned by the company 2 miles and 40 chains. The number of passengers conveyed in 1877 was 56,175,753, about one-third the number annually conveyed over the 120 miles of horse car roads in New York. The receipts of the half year aggregated £224,949 7s. 10d., or at the rate of £2,249,490 for the year.

LONG RUN TO A CORD OF WOOD.—The locomotive *Santa Fe*, on the Atlantic, Gulf & West India Transit Company's road, we are informed, on one day in March made the run from Fernandina, Fla., to Cedar Keys, 155 miles, with the mail train of three cars, using only three-quarters of a cord of wood, or at the rate of 206½ miles to the cord. The schedule time of the train is 9½ hours, and the usual consumption of wood by other engines is 2½ cords for the run. The engine is of the ordinary eight-wheel pattern, with 14x22 cylinders, and four 5-foot drivers.

SCIENTIFIC PROGRESS.

Professor Garrod on Protoplasm.

Prof. Garrod, in the second of his course of lectures at the English Royal Institution on the protoplasmic theory of life, said that he believed the original idea of a cell as first taught by Schleiden and Schwann is incorrect. The use of the reagents they employed, to get clearness as they supposed, really brought about artificially those changes which led them to believe that a cell consisted of a cell-wall, cell-contents, nucleus and nucleolus. Prof. Garrod would define as a cell a separate mass of protoplasm, whether surrounded by formed material or not. This formed material comes from the precipitation of salts of lime by the protoplasm and from the formation of hyaline, etc. In this way the tissues of the body are built up. In the growth of the epidermis the cells are gradually more and more filled with precipitated matter, the protoplasm occupies less and less space, and finally the cells die and are removed from the surface. In fatty tissue the hydrocarbons of the food are gradually precipitated in the cells till the protoplasm becomes only an investing membrane. The muscular tissue is material formed by protoplasm, but is not itself alive. Allusion was made to the statement of the striation of muscles mentioned in most text-books. Mr. Schafer's microscopic observations on the leg of the water-beetle suggest that this is a deceptive optical effect rather than a reality. In speaking of the elastic tissues precipitated from protoplasm, the ligament which supports the head of quadrupeds was specially referred to; and Prof. Garrod said he thought that many who had written about bearing-reins did not know that this ligament, when strong and healthy, holds up the head of the animal without effort, and that it is an effort for the animal to get its head down to feed or drink. Some young animals keep this ligament on the stretch too much—a bad habit which the hearing-rein tends to correct. After speaking of nerve tissues being evolved like all the other tissues from protoplasm, Prof. Garrod referred to the foods that have to be taken to supply this protoplasm. As is well-known, writers on foods group them into organic and inorganic, with the organic again subdivided into nitrogenous and non-nitrogenous. The nitrogenous foods, it is now believed, contrary to Liebig's first teachings, are those used in repairing the "machinery" of the body, while the non-nitrogenous furnish the source of power for action—play the part of fuel, as it is often popularly put. In a letter lecture of the series Prof. Garrod spoke of the red color of arterial blood in contrast to the blue color of venous blood, and showed an experiment with spectra in illustration of this. The spectrum of diluted red blood was first shown, and then to the solution of a deoxidizing agent was gradually added, when the spectrum of blue blood appeared. The difference of color is due to the oxidized condition of red blood and the deoxidized condition of the blue. In both cases the serum is of the same straw tint, and it is the color of the protoplasmic corpuscles which is changed. The oxy hæmoglobin which colors them in the arterial blood is deoxidized into hæmoglobin as they circulate through the body. It is believed that the oxygen of the oxy hæmoglobin is but very slightly attached. Some experiments were shown with the Sphygmograph to illustrate that the character of the pulse is dependent, not only on the heats of the heart, but also the pressure on the heart, and the connected blood vessels being increased and relaxed by each inspiration. In speaking of the heat of the body, Prof. Garrod said it was to be recollected that not only muscular action, but the "vitality" of protoplasm all through the body—very analogous to combustion—gave a regular supply of heat.

MINING AND METALLURGY.—In his report to the Assembly Committee on Education, Prof. Becker, of the State University, made the following allusion to the needs of his department: Mining engineering is probably the most complex of all professional studies; involving many branches regarded as the substance of separate professions. Not only must the mining engineer be a civil engineer, a mechanical engineer and an hydraulic engineer; but he must be a geologist, a mineralogist, and, above all, a chemist as well. Instruction in mining and metallurgy of the University of California has, however, thus far been given only by a single instructor, who is compelled to deliver six separate courses, averaging forty-two lectures each, besides laboratory instruction in assaying, and yet fails in the endeavor to cover more than the most indispensable portions of the science; many important topics, such as electric-metallurgy, casting, and others being omitted for want of time. In well organized schools of mining the whole time of at least four instructors is considered indispensable to sufficient instruction in the same topics; those, namely, which bear directly upon the practice of the profession. No pretence, therefore, can possibly be made, that the subjects are exhaustively treated; all that can be attempted is to infuse the spirit of modern mining science, and to place the students in a position to supplement by their own studies the imperfect instruction they receive. This effort, it is believed, has been measurably successful.

Evolution and Materialism.

We of to-day hear so much about evolution and materialism that it is well for us to fully understand their meanings. To many they are one and the same thing. But Prof. Le Conte, of the University of California, in the current number of the *Popular Science Monthly*, very clearly shows the distinction between the two. He says: "First of all I wish frankly to acknowledge that I am myself an evolutionist. I may not agree with most that evolution advances always *cum aqua pite*. On the contrary, I believe that there have been periods of slow and periods of rapid, almost paroxysmal, evolution. I may not agree with most that we already have in *Darwinism* the final form and *survival of the fittest*, the prime factor of evolution. On the contrary, I believe that the most important factors of evolution are still unknown—that there are more and greater factors in evolution than are dreamed of in the Darwinian philosophy. Nevertheless, evolution is a grand fact, involving alike every department of nature; and more especially evolution of the organic kingdom, and the origin of species by derivation, must be regarded as an established truth of science." This paragraph on evolution was quoted in our notice of Prof. Le Conte in last week's PRESS. We wish now to publish it in connection with his definition of materialism, that the contrast may clearly appear. He says: "But, remember, evolution is one thing, and materialism another and quite a different thing. The one is a sure result of science; the other a doubtful inference of philosophy. Let no one who is led step by step through the paths of evolution, from the mineral to the organic, from the organic to the animate, and from the animate to the rational, until he lands logically, as he supposes, into blank and universal materialism—let no such one, I say, imagine for a moment that he has been walking all the way in the domain of science. He has stepped across the boundary of science into the domain of philosophy. Yet the step seems so easy, so natural so inevitable, that most do not distinguish between the teachings of science and the inference of philosophy, and thus the whole is unjustly accredited to science."

Asbestos Felt for Filters.

Mr. F. A. Gooch, of Cambridge, in a paper recently presented to the American Academy, describes a method he has devised of preparing a felt of anhydrous asbestos, which, says the *Journal of Chemistry*, is capable of filtering liquids rapidly and efficiently; is light, compact, and incombustible at the highest temperatures used in analysis; is not acted upon by acids (except hydrofluoric) or alkalis; is not disintegrated by forcing a liquid through it with the Bunsen pump; and is very easily prepared. By its use more accurate results can be reached in many analytical processes than in any other way. The felt is prepared by scraping white silky asbestos to a fine, short down, boiling it with hydrochloric acid, and washing it by decantation. It is then deposited by the aid of the Bunsen pump on the bottom of a platinum crucible perforated with fine holes; or, better, the bottom may be made of fine platinum gauze. The process, which is described and illustrated in the "Proceedings" of the Academy, is simple and quick, occupying less time than is required for folding and fitting an ordinary paper filter to a funnel. Various modifications of the method suited to special cases are also described. These filters are found especially useful in the treatment (1) of precipitates which must be dried at low temperatures, being liable to spontaneous decomposition at higher ones, (2) those which have had to be separated from the filter before ignition to avoid reduction by heating in contact with carbon, and (3) those which may be ignited in contact with carbon, but which make its complete combustion difficult. We commend the method to the attention of chemists.

THE POPULAR SCIENCE MONTHLY.—The progress, which has been made of late years in the dissemination of scientific truth among the people, can be clearly seen in the wide circulation which has been secured by scientific publications. Take, for example, the uprising of the *Popular Science Monthly*, of which D. Appleton & Co., of New York, are publishers, and Prof. Youmans, editor. The life of this periodical marks an era in the popular science progress of this country. It sprang at once into wide circulation, because of the popular demand that the researches of leading investigators should be no longer locked in the folios of technical, and, to many, unintelligible volumes. It has grown vastly since its beginning, because it has itself fostered and promoted the demand for popularized science. Thousands have been attracted from the following of the shallow and the sensational to the pursuit of truth, because facts have been shown to be, in many cases, far more valuable and intrinsically interesting than fancies. In this feature of its work the *Popular Science Monthly* has done a work and exerted an influence which brings honor to the name. We have already in a previous issue alluded to the demand for "more light," which forced Messrs. Appleton to begin the publication of the *Popular Science Supplement*. This venture has proved almost as valuable to the public as the original magazine, and we trust may be remunerative to the publishers.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

DOUBLE STANDARD.—*Chronicle*, May 4: The mill continues steadily at work, and the work of the concentrators are satisfactory to Superintendent Coleman. The sulphurets will be shipped to San Francisco as soon as sacks are procured.

THE ADVANCE.—Running in a good ore body continues in the north drift. Other portions of the mine look well.

CALAVERAS.

GRAVEL MINES.—*Chronicle*, May 11: The season from the first rainfall has been unexceptionally favorable. Water is abundant and promises to hold out till late in the summer, and the mines generally are looking and yielding well. The Rough Diamond claim is worked through a tunnel. The gravel is so hard that it is to be crushed before being put into the sluices. It is a great success and employs many men in the mine and mill. Brown & McSorley have also developed a fine body of gravel. McCann's claim, though not extensive, is paying well, also the Veith, which is opened on a large scale. Mason & Co. own a first class property which gives employment to a large number of hands, and is coining money for the owners. The claim of Moser & Co. is fitted up with the best of modern appliances, is well managed, and best of all is making the fortunes of its owners. The old Deepwound ground has been put in good shape and will be ready for operations in a few days. Emerson has one of the best appointed claims in the mountains, uses about 1,000 inches of water, and will make a big clean up shortly. At Buckeye, Cook, Smith & Co., proprietors of the Gopher hydraulic, are working steadily and are doing well. The Calaveras hydraulic, the property of Cook, Raynor & Cook, is being steadily worked with satisfactory results. On the lower Stockton road, near the French Hospital, Mr. W. W. Cook is operating an extensive hydraulic. At the Duryea mine, in Chile gulch, everything is progressing favorably. Work is being crowded ahead as rapidly as possible, and a large amount of gravel is washed daily. The battery is kept in ceaseless motion, the mill and mine affording employment for from 25 to 30 men. The yield of the mine is satisfactory, and its prospects excellent.

EL DORADO.

THE BOULDER CLAIM.—*Mountain Democrat*, May 11: Work on this claim at Pilot Hill, the property of the California Water Co., is progressing finely. The run will terminate about the first of July, when a big clean-up is anticipated. A few nights ago, the watchman saw a Chinaman creeping into the sluices, and blazed away with a charge of huck shot. Two or three days afterwards, a Chinaman with a badly mangled hand and perforated trousers was seen lurking about. He is supposed to have been the recipient of the watchman's leaden bounty.

NEW MINING ENTERPRISE.—Mr. Chapman, who represents a large amount of Eastern capital, was in Placerville last Tuesday, for the purpose of recording the patent to a large river and bank claim at Brown's Bar, on the Middle Fork of the American, a short distance above Murderer's Bar. The claim is to be worked by a pumping machine which will rapidly raise sand, gravel, and even boulders of two feet to thirty inches in diameter. The machinery is to be rigged on a boat, constructed of immensely heavy timbers, the boat is to be 30 feet wide and 30 feet long. A similar enterprise was unsuccessfully tried at Oroville, but Mr. Chapman was a witness of that attempt, studied it closely, and is sanguine that he perceived and has overcome its defects. In that case the boat was too long and not wide enough, causing a tendency to "hog." The machine proper was a success, doing its work perfectly; but the engine used—a ten-horse power—was totally inadequate to the work required. Mr. Chapman has supplied himself with an engine of forty-horse power, with a boiler of fifty-horse power. His pumping cylinder will be three feet in diameter, and will lift and deposit into a dump at the head of the sluice boxes a charge of about five tons every three minutes. Mr. Chapman estimates that he can lift and wash gravel with his apparatus at a cost not exceeding four cents per ton. He expects to have it in operation within 30 days. If it proves a success—of which we entertain no shadow of a doubt—it will work an immense wealth-producing revolution in river mining.

NYO.

SWANSEA.—*Independent*, May 4: The furnaces here are undergoing complete repairs preparatory to business. The Ygnacio company have agreed to put 10 men at work getting out rich silver ore for the new works, for which liberal prices are paid per ton.

LAKE DISTRICT.—This locality possesses many advantages as regards water, timber, grass, etc. The mountain in which the mines occur is very lofty, runs nearly north and south, and carries gold and silver in croppings and float for a distance of four and a half miles. About four miles to the southeast of this main belt are numerous base metal ledges, well defined, and of an average width of four and a half feet. Some of these assay from \$40 to \$180 per ton in silver, with a trace of gold. The number of mining locations to date is supposed to be about 300, besides timber claims, hyacinth ranches and mill sites. The town at the mines is known as Lako City, so called from the five small lakes adjacent thereto. Lots are taken up and fenced for a distance of about one mile, and some 20 or more houses are in course of erection. The town at the foot of the mountain about two miles west of the mines is known as Mineral Park, which, though not so extensively located as yet, has the appearance of a more permanent business place, as it will be as far as teams can get for three or four months to come. The number of inhabitants is estimated at 125.

NEVADA.

KEEPING IT UP.—*Transcript*, May 13: The usual monthly dividend of \$7.50 per share, amounting to \$23,350 has been declared by the Idaho mining company, of Grass Valley, payable immediately. The bullion product for April was \$58,000, all gold.

THE RELIEF HILL MINES.—Owing to the high price of water and the unusually large amount of pipe-clay which has been encountered of late at the Relief Hill mines, hydraulicing has been rendered impracticable, and drifting has been substituted, with most favorable results. The various mines are in full operation, and a large amount of gold is being taken out.

PROGRESS IN THE WATT MINE.—Sinking has been stopped in the Watt Blue Gravel mine, and drifting commenced. The drift is in over 30 feet from the shaft, with the bed-rock pitching almost due east. Another week's drifting will enable the projectors to form a better idea of the situation. The water has slackened off considerably, and the machinery is working well.

YOU BET.—Both the English and Hussey hydraulic companies have lately made satisfactory clean-ups. The Nevada company are rushing things ahead lively, and in a few days will have another claim under full headway.

PLACER.

DAMASCUS AND VICINITY.—*Argus*, May 4: The Mountain Chief, a comparatively new mine, situated near the Sugar Pine mill, is being actively and intelligently developed by a company of practical men. An incline shaft, 175 feet in length, has already been sunk. The claim promises very well, as every indication goes to show that the men now working are over the ancient blue lead channel, which all drift miners up here hope to strike. The Michigan Bluff Enterprise company, whose claim is about a mile north of the Sugar Pine mill, will shortly resume operations. The West Damascus mine will also be in operation soon. It is situated between Damascus and Iowa Hill. The Golden Fleece, another new company, controlled by San Francisco capitalists, is situated at the Hog's Back, seven miles above the Fork house. They are setting their men to work now. About ten new companies have lately been formed to work claims in the vicinity of the Hog's Back. The Mountain Gate mine is being profitably worked in cement. The men at the Lewis claim are drifting at present. They are understood to be doing well. At Canada hill, A. G. Reed had some of his iron pipe destroyed by the snow crushing it flat. About 20 feet of snow lay upon it in places, and being empty, the pipe had to succumb. Previous to the late storm there was an average of eight feet of snow here. Part of the mine has been leased to Mr. Shipman, of Forest Hill, who is working Chinamen. Part of the tunnel caved in lately, owing to its nearness to the surface and the soaking through of water from above. The American hill and Walter Palmelee's claims are reported as doing well.

THE BREECE AND WHEELER claim at Bath is doing well. The owners have already cleaned up twice and will have one or two more runs. Water is yet quite plenty, some 1,300 inches now running over their dam to waste. They are likely to run until late in June and probably to the first of July. The Van Emon claim, at Michigan Bluff, is also doing very well. Indeed all the hydraulic claims on the Divide are getting in a long and profitable season's work.

SIERRA.

WATER.—*Mountain Messenger*, May 11: The Bald Mountain company struck a heavy flow of water in their mine a few days ago. The water broke through the pipe-clay in gangway 77, and ran about 60 inches for a time, but finally subsided to about 40 inches and remained at that at last accounts. Several breasts were caved, and the workmen were obliged to leave the mine for a time. If the volume of water will continue through the dry season it will prove of great value.

TRINITY.

WEAVERVILLE D. & H. M. Co.—*Journal*, May 11: The ditch of this company is in fine condition, and carrying 1,200 inches of water, which it will continue to do for two months to come. On the Ward mine they are running two large pipes, the large holders being lifted out of the way by a water-worked derrick. Two partial clean-ups have been made in the mine this season, about \$9,000 being taken out. But little bedrock has been uncovered, and that little on the rim. It is of a shelly nature, and shows considerable gold. The product of mining claims is hard to estimate, but it is thought that the yield of the Ward claim this season will be between \$25,000 and \$30,000.

MINING operations all over the county are now becoming lively.

TUOLUMNE.

MINING ITEMS.—*Independent*, May 11: The Riverside is running night and day, Sundays and all. It is one of the best pieces of property in Tuolumne county. Have just commenced to run a new tunnel. Will have air compressor, Burleigh drills, and all the latest improvements. A friend of ours has recently struck a pocket—one lot we saw weighed brought down five pounds of gold.

THE MOUNT JEFFERSON MINE.—Increased attention is now being paid to quartz mining in this county, a business that has been strangely overlooked in view of the many promising ledges to be found here. Among the more prominent companies who have lately started in afresh here is the Mount Jefferson, who own a valuable quartz mine situated at Groveland. The owners of this fine property, who are mostly residents of San Francisco, are now engaged in pumping the water from the old works, and taking other preliminary measures for putting the mine in good condition for renewed production, satisfied that they can soon place it upon a dividend-paying basis. This claim was worked in former years and paid well, much of the ore having been reduced in arastras by the Mexicans, an evidence that it must have been of good grade and easily treated. The present owners have sent up a powerful Wilcox steam pump already in position, and which it is expected will soon rid the mine of water, after which with some repairs required on the mill and hoisting works, the entire property will be in splendid condition for active and profitable production. They have already a first-class steam quartz mill with steam hoisting works erected at considerable expense. F. G. Cleland, an experienced quartz miner, has been put in charge of this property, a guarantee that it will be managed with economy, honesty and skill. The property here is abundant, and can be mined and milled at very moderate cost. The principal owners of the Mount Jefferson are Messrs. Condee, Cleland, Fassett and Shattuck, all well known business men at the Bay, and whose example of opening up some of the many quartz mines of the interior, might well be followed by other of the citizens of San Francisco.

Nevada.

BELMONT DISTRICT.

WILL RESUME.—*Courier*, May 4: The Combination mines at Belmont will be started up soon. These mines, which belong to a New York corporation, have lain idle for several years. At one time they were considered as among the best mines of this State. The company owns one of the finest quartz mills in Nevada. A force of men are cleaning out the mine, and steam has been gotten up in the mill.

OTHER DISTRICTS.—Work is progressing finely in the mines of Danville district, in this county. Alex. Trippell, the Superintendent, is determined to push the work of development as rapidly as possible. The snow is fast disappearing, and the miners can now work without interruption. The prospects so far are encouraging, and it will not be a matter for surprise to learn of a rich strike being made there soon. Prospectors in Jett district are hard at work. Several pieces of rock were brought into town this week and assayed.

BRISTOL DISTRICT.

HILLSIDE.—*Pioche Record*, May 4: Exploration is being pushed in this mine, with steady ore extraction. Arrangements for starting the furnace are being made as rapidly as possible; such as cutting wood and making charcoal, as it is the intention to start the furnace on a test run of 30 days as soon as all arrangements are completed.

DAY MINE.—Nothing new here since our last report. Sinking the winze is progressing favorably, the rock being of a nature unfavorable for making speed; still in low grade ore; total depth below the tunnel 112 feet. The lower tunnel is progressing steadily at the rate of 12 feet per week—ground very hard.

CHERRY CREEK DISTRICT

STAR COMPANY.—*Independent*, May 4: This company shipped to-day to San Francisco 10 bars of bullion, and for the week a total of 15 bars, worth \$11,000. The shaft has attained a depth of 76 feet below the 360 level, and if nothing happens the company will be ready to drift on the next level within two weeks. On the 360 level the east drift has attained a length of 190 feet, and the west drift 342 feet, or a total of 532 feet of drifting along the ledge. The winze connection being made between the 270 and the 360 levels is almost completed.

MARY ANN.—A body of ore has been struck in this mine assaying from \$68 to \$339 per ton. As soon as possible the six-stamp mill of the Geneva company will be started up on this property.

EUREKA DISTRICT.

MINING ITEMS.—*Sentinel*, May 11: The developments on the third level of the Jackson continue, and the mine is looking splendidly. Rapid progress is being made on the connecting drifts between the K K Con. workings and the Phoenix shaft. The Humburg developments are the largest and best ever found in that property. The extent of the ore bodies is not yet determined, but enough is in sight to secure a long and profitable run. The lessees are taking some fine ore from the Union and Charleston mines, on Prospect mountain, and shipping the same to the Richmond furnaces for reduction. The mines are situated in the same belt with the Emmett, Metamoras and El Dorado, and are

developing splendidly. These locations have proved themselves to be among the richest on Prospect mountain.

THE WILLIAMSBURG MINE.—This property is proving itself to be one of the best locations in the district. In a quiet sort of way it is adding its quota to our bullion product, and is opening up a very large ore body. Unfortunately the percentage of lead contained in the deposits runs very high, and are not available at the present prices of that metal. At least 5,000 tons of ore that will carry 60% of lead, and assay \$30 to the ton in silver, is in sight. This leaves no margin for profitable smelting. In consequence the higher grades have been assorted and sold to Salt Lake purchasers for shipment. It looks as if Utah would absorb all our custom ores. Mine owners state that ore buyers from Salt Lake are very liberal in their terms.

THE TWO BIG MINES.—The Richmond company are receiving large quantities of wood for use at the refinery. Over 1,000 cords are stacked up in the neighborhood of the works. The Eureka Con. mine never looked better since its discovery. There is 12 months' dividends in sight, and a promise of still greater developments.

ORE AND CRUDE BULLION.—The value of the crude bullion shipped daily from the Eureka averages over \$30,000, the number of carloads varying from 12 to 20.

POTTS' CHAMBER ORE.—There is some slight difference in the estimation of the value of the ore taken from the Potts' chamber by the Richmond company. The Eureka Con. company brings suit for \$2,500,000 damages, and Secretary Morrison, of the Richmond company, writes to the London directors that the company is in a position to prove that the market value of the ore removed was under \$20,000.

HUMBOLDT DISTRICT.

BATTLE MOUNTAIN.—*Silver State*, May 11: The new furnaces ordered for the White & Shiloh will be on hand about the middle of the month. The Avalanche, Trinity and some others of the Galena mines are being worked with good results, promising prosperity for the camp the coming season.

BARTLETT CREEK.—A ledge has been found here lately that assays well in silver. L. Vary is engaged in extracting ore from the Montank and working it in an arastra. The ore yields by this process from \$80 to \$100 per ton. At Snow creek, placer mines are being worked, but with what success we have not learned.

PARADISE MINES.—The excitement here still keeps up. Several fine looking ledges have been discovered and located within the last week or two. The Mammoth mine, recently discovered within a mile of the Big Prize, is proving to be the richest as well as the largest yet found in that locality. It has been named the Mammoth in consequence of the large size of the vein, which crops out boldly on the side of the mountain. It was located some time ago, though never prospected and virtually abandoned by its former owners.

Arizona.

YAVAPAI COUNTY.—*Enterprise*, May 4: Good news from Humburg district. Tiptop, Foy and other mines looking well. Plenty of ore at the mill, which is kept constantly at work. Several new houses being erected near mine and mill.

PECK DISTRICT.—Mill running all the time. Mine yielding plenty of ore that pays about \$700 to the ton. Miners stopping in tunnels and blasting in the winzes. Wood coming in fast. The town of Alexandra is growing. A great many prospectors in the district.

BRADSHAW DISTRICT.—The Tiger lode is astonishing the natives. People arriving there from everywhere. All surprised to see such immense bodies of good ore. Cougar, Lorena and other mines in the district are looking very promising.

TURKEY CREEK DISTRICT.—Not much doing here, just now. The Compton mine is doing splendidly.

HASSATAMPA DISTRICT.—Crook mill doing good service. Owners of claims on the Crook lode are taking out ore. Richard Sparling and others doing same on other mines. Some activity noticeable around the Senator mill and mine.

GROOM CREEK.—Ledges opening out nicely. All hands hoping that the Aztlan mill will speedily start up.

WALKER DISTRICT.—Elliott & Co.'s four arastras—run by steam—keep going, night and day.

BIG BUC.—A great many capitalists nosing around. McKinley will soon start work on the Silver Flake. McCarthy Bros. looking to see what they want.

BLACK HILLS.—Empire mine spreading itself. Other mines following suit. Large party of second-hand miners out there now, looking for holes to crawl into.

PLACER miners doing well on Hassayampa Lynx and other creeks.

R. J. CARTER and J. B. Morey have recently located a placer claim of 120 acres on lower Hassayampa; also, 1,000 inches of water. They will incorporate and put up hydraulic works. Gravel said to be rich.

PECK COMPANY will soon contract for large supplies of wood and salt. Their whim will shortly be ready for the hoisting.

The foregoing districts are all close to Prescott, are pretty well watered and well timbered. Climate—finest that can be imagined.

The Silver King mine has been turning out during the last few months about \$50,000 per month at a very small cost.

THE ENGINEER.

A Magnificent Arch Bridge.

Sir Joseph Bazalgette has presented to the Metropolitan Board of Works of London a report favoring the construction of a new bridge over the Thames, near the Tower. The bridge he recommends is a single arch of 850 feet span, by far the largest arch span in the world. The following is an extract from his report: I have considered the relative suitability of various forms of bridges, viz., suspension bridges, girder bridges and arch bridges, and of the material of which such bridges could most advantageously be constructed. Suspension bridges, although in many instances economical for wide spans, are liable to considerable vibration with heavy traffic, and seem to be unsuited to this locality owing to the great height that would be required for the towers, the character of adjoining banks and the length of the anchor chains. A straight girder bridge could not conveniently be built to cross the river in one span, and such form of construction would render it necessary to place two piers in the river as above described. An arched iron bridge of one span, with a roadway over it, would have a very handsome appearance, but it would necessarily form a very flat segment, so that the strain upon the metal and thrust upon the abutments, would be very great, and it would therefore require a heavy mass of metal, and become very costly. It would, moreover, unnecessarily reduce the headway for shipping near to its haunches. I am of opinion that a trussed girder bridge of one span, in an arched form, with the roadway carried across the arch, and suspended from it, will probably afford greater advantages than any other sort of bridge. The East River bridge now in course of construction between New York and Brooklyn will be the largest span bridge in existence. It is a suspension bridge with a central span of 1,600 feet. The proposed suspension bridge over the Fifth of Forth, which it is expected will shortly be commenced, is designed with two spans of 1,600 feet each, but the platform which it is to carry will be only one-fourth of the width, and designed to carry only one-fourth of the moving load that the Tower bridge is intended to carry, so that the total weight of the greatest span with the full live load upon it will not be more than one-third of the total weight of the Tower bridge when so loaded. The Tower bridge would be the largest arched bridge in existence.

Great advances have of late years been made in the manufacture of steel, and it is now produced at a cost not much in excess of that of iron some few years back, whilst its much greater strength to resist both tensile and compressive strains enables the weight and cost of the structure formed of it to be greatly reduced, and renders it especially suitable for bridges of large span. The St. Louis bridge which has recently been built over the Mississippi is a bridge of the same character, and is constructed of the same material, although its width and span are not so great as those of the bridge now proposed.

It is intended to make the width of the new bridge 60 feet, subdivided in two footways of 12 feet each, and a carriage way of 36 feet. The Tower bridge will, therefore, be in all six feet wider than the London bridge, which is 54 feet, the carriage-way being 34 feet 8 inches, and each of the foot-ways 9 feet 8 inches in width. I estimate the cost of such a bridge, if erected in three spans, including the cost of forming approaches and the purchase of the property required, at about £1,100,000, whilst the cost of such bridge, if erected of one span, which I recommend, would be about £1,250,000.

How to Build Wooden Rails for Steam Roads.

As we have lately described, there seems quite a disposition now to build wooden railways for steam locomotives in regions where wood is plenty, and the expense of iron cannot be borne. This has been so far reduced to practice that Eastern locomotive builders are announcing styles of locomotives which are especially adapted to use on wooden rails. One of these firms have prepared an interesting statement of the best timber to use in these roads and how to lay them. The kind of timber to use is of course a local question to be decided according to available supplies. It is said that the best wood is maple, laid with the heart up; hard pine is used in the South. The simplest form of wooden rail is a stringer cut in 16 to 20 feet lengths, and of such cross section as the kind of wood or weight of engine requires. Six inches square stringer is the size we would generally advise, although five inches face by seven inches depth is as good. Four inches face by six inches depth, or five inches square will answer for our smallest engines, if the wood is good; still smaller sizes may be used by placing the cross-ties close together, say two feet or two and a half feet between centers; for large stringers, four feet between centers will answer. When worn out on the top the stringer may be reversed, and when again worn may be used for ties.

The ties are easiest fitted and laid if made uniform, and of about the same size lumber as the rails; six inches square is heavy enough. Any cheap lumber not specially liable to decay will do. Ordinary hewn ties may be used,

but not being uniform are less convenient for cutting out recesses for rails. They should be at least three feet longer than the width of the track between rails.

The ties must be cut out accurately and uniformly to receive the rails. The recesses should be about three inches deep, and be at the top face of the tie an inch, and at the bottom of the recess one and one-half inch wider than the rail. The inner faces of the recesses are perpendicular, and the distance between them is the gauge of the track. The bottom of the recess should be level, and ties laid well to afford proper bearing for the stringer.

Wedges made of any cheap wood, or better, of ends of stuff left from rails, are driven on the outsides of the rails. They are made of right shape to fit the space left; the reason for making this space wider at the bottom than at the top is to keep the wedges from working up, so that the rail may be held securely in place.

The stringers must be arranged to break joints on the ties. Both stringers should not break joint on the same tie; the stringers are sometimes sawed off diagonally instead of perpendicularly, so as to be lapped and spiked together. The lumber for a hard pine wooden road costs about \$450 per mile.

With another style of wooden road the stringer is made of hemlock or any cheap lumber, and a maple strip four to five inches wide and two and one-half to three inches thick is spiked on to the stringer. By this plan, such a part of the rail as is worn out may be removed without taking up the stringer. This maple strip may be replaced by a T iron rail considerably lighter than would be required if laid directly on cross-ties. We would strongly advise this instead of strap iron.

A wooden rail is very slippery when wet, and hard to keep clear of snow and ice in freezing weather. On very bad curves and steep grades a wooden rail is impracticable, and iron must be used.

A locomotive has but one-half or two-thirds the power on wood that it has on iron; the friction useful for traction is less, and the flange friction is greater. Locomotives for wooden rails require to be very strongly built and to be evenly balanced; the weight should be less and the drivers larger than for the same size cylinders on iron rail.

Generally speaking we would dissuade any one from laying a wooden rail. In cases where lumber is cheap, and iron very dear, it may be advisable to operate a wooden road, as for instance where a cheap improvement on an ordinary country wagon road is needed. To do any considerable business on the very best wooden road that can be built, will in the words of one of our customers who has tried the experiment, "require a very rich concern." Parties using animal power for hauling on a wooden rail, if content not to greatly increase the load, may effect a very considerable saving by using a locomotive; but for transportation upon a scale of any magnitude, wooden roads are very unsatisfactory and almost impracticable.

A NEW ROUTE TO THE PACIFIC.—While the Texas Pacific enterprise is temporarily resting at Fort Worth, awaiting the slow and uncertain action of Congress, the *Railway Age* says a determined forward movement toward the Pacific has been commenced in another quarter. The new rival is the Atchison, Topeka & Santa Fe company, a powerful and prosperous corporation with over 800 miles of road already in operation from the Missouri river to Colorado. This company has long been looking forward to the feasibility of extending its line into the rich regions of New Mexico, and the recent accession to its active direction of a manager noted for his aggressiveness, has been followed by a vigorous movement southward. The only practicable entrance from the southeastern corner of Colorado into New Mexico is through Raton Pass, a little south of Trinidad. This pass the Denver & Rio Grande company intended to make use of for an extension from Trinidad, in the same direction, but a force from the Atchison, Topeka & Santa Fe captured it at midnight a few weeks ago, and is now industriously engaged in preparing the bed for a branch of that road from the main line at La Junta.

MINING ENGINEERS INVITED TO GERMANY.—The Prussian Minister of Commerce, Industry and Public Works, Dr. Acenbach, has addressed the following official communication to Professor Egleston, of the School of Mines, Columbia College: "In the expectation that American mining engineers attending the Paris Exposition this year will extend their tour of observation to Germany, for the purpose of inspecting its industrial establishments, and being desirous to reciprocate the friendly reception accorded to German artisans, and especially to the commissioners sent by me, on the occasion of the Centennial Exposition at Philadelphia, I have directed that technical works and geographical, topographical and other maps be open for inspection to our American visitors in the library of the Royal Mining Academy, Lustgarten No. 6, and that information can be obtained there regarding the most desirable routes to take, and the location and importance of the industrial establishments which the visiting engineers may desire to inspect."

TUSCARORA.—Latest intelligence from this district represent the mines as showing some improvement, and the prospects of the camp every way better.

United Efforts for Homes.

If our unemployed workingmen would devote one-half the effort in uniting to secure themselves homes by building up colonies on unoccupied lands, which they now put forth in applauding men with communistic ideas, the coast would be the better for it. If our large capitalists, who would consider any contribution worth making if it would foster the present discords among the workingmen, so that all their schemes would collapse, would but lay down half the money to help these landless ones to secure small but productive homesteads, they would gain a surer and quicker freedom from the seditions which hazard all their enterprises and endanger all their property. There was a world of truth in an Eastern comment on communism in this State, which was telegraphed a few days ago, to the effect that there "was little danger of a serious communistic outbreak in San Francisco, because too many workingmen own their own homes."

It is true. It is wonderful what a change is wrought in a man by the owning of a freehold. Nothing we have ever read in praise of the wholesome effect upon a man's aims and ambitions of the possession of a piece of land which is all his own, from zenith to antipodes, has done the subject too much credit. It is a wonderful balance to place upon human inequalities and tangles, this charm and responsibility of home owning. It engenders a feeling of actual oneness with the cause of law and order which no homeless man can appreciate. It sends a flush of independence through the heart and life. It awakens the mind to thoughts of the need of the protection of just laws and pure government. It brings ideas of political and social economy, crude though they may be, direct to the brain. It makes him a seeker for the real and a hater of the visionary in all questions of property and its protection. Mistaken may be his politics, wild his religion, rude his life, but when he plants his foot upon the warm surface of his dooryard, or turns the fertile soil of his farm, he is true in his devotion to it and strong in his hatred of any communistic fallacy which would endanger his claim to his own.

It is plain that one of the surest ways to draw from the ranks of the malcontents, is to bring men under the influence of ownership. Of course it is much easier said than done, and yet the saying is worth the while, because the proposition is not altogether impracticable. Something is being done each day. Men are continually forcing their own way to the right side of the line. There are two possibilities which present themselves to our mind. One is that they might do this far more generally of their own effort and accord. Another is that there might be a better effort made to help them to it by systematic action among those whose interests demands such action and its influence.

First, what can landless men do for themselves? By co-operation, by united effort they can do what each, single-handed, could, perhaps, never accomplish. By uniting in the form of a colony, they could make one man do the work of a hundred in seeking out a place where, perhaps, a hundred families could, by working together, build up a prosperous neighborhood. They might have to move hundreds of miles to find good land to take from the Government. That is nothing; the last generation moved thousands of miles in the same pursuit, and were successful. Hardships, economies and self-denials lie in the path? Yes; but the last, yes, and many of the present generation have triumphed over them. The pioneers of this State could not find the fortunes they sought, just beyond their eastern garden walls. No; they had plains to cross, or oceans to navigate. Should their successors, then, expect to pre-empt farms or locate mining claims on Kearny street? If the old will to succeed still exists in men's minds, what is there that shall deny them success? As we have said, if one-half the effort were made by homeless men to seek out places where they can develop homes, which is now given to draining their purses, and shouting themselves hoarse in adherence to demagogues, the result would be accomplished. Let them combine their small resources. Let them save the dimes as many a man saved them 25 years ago to pay his way to California. Let them then thus create a small fund which will pay all the expenses of preliminary examination and location of land wherever it may be found, and then let them make their way to this promising land and develop it. It is harder than city loitering it is true. It is hard. It has been done. It can be done again.

We have said that more might be done by men of means to insure the popular safety, by turning idle mischief-ready hands to productive, self-supporting home making. The Government sets the example and does its part. Wealthy citizens could unite and make efforts to make this Government generosity available to the poorest men, by aiding them until they become self-sustaining. We have just heard of an Eastern movement to secure this desirable result. An important benevolent enterprise has been inaugurated at Boston in the formation of a board of aid to land ownership, an object of which is to colonize worthy laboring-men, who are out of employment, in order that they may earn a living by tilling the soil. The association is to consist of 24 members. There will be an advisory board of 200. The association proposes to purchase land in large tracks, and to sell it in alternate sections to

colonists at cost, supporting those who have no money until they are able to pay for their fields by the labor of their hands. These lands are to be settled under the supervision of competent superintendents, who will instruct novices in agriculture how to get their living from the soil, and anti-liquor and gambling laws are to be rigidly enforced. Tenders of co-operation have been received from various railroad and land companies, and a committee has started for the West and South to examine various tracts to which their notice has been called.

This is, apparently, a practical enterprise in which the rich men of California could engage. Thus could they transform into responsible citizens an element of our population which is now a danger to itself and to the general prosperity. Thus could our holders of surplus wealth serve themselves and the State. Is not the proposition worth consideration?

Wild Animals During Drouth.

The sufferings endured on account of the drouth were at times almost terrific. The throats of the oxen were so parched that they could not low. The dogs suffered even more than the cattle. Nor are the wild animals exempt from the plague of the land.

When water becomes scarce in these thirsty plains, the whole of the wild animals that inhabit them congregate around any pool that may be left, for with very few exceptions all have to drink once in 24 hours. The lions, which follow the game, thus are led to their drinking places not only to assuage their thirst, but to satisfy their hunger.

To watch one of these pools at night, as I did in the northern Massara country, is a grand sight, and one never to be forgotten. The naturalist and the sportsman can here see sights that will astonish them, and cause them to wonder at the wonderful instincts possessed by the animal kingdom.

At such watering places the small antelopes invariably drink first, the larger later on, and with them the zebras and buffaloes. After these come the giraffes, closely followed by the rhinoceros, and next the elephant, who never attempts to hide his approach—conscious of his strength—but trumpets forth a warning to all whom it may concern that he is about to satisfy his thirst. The only animal that does not give place to the elephant is the rhinoceros; obstinate, headstrong, and piglike, he may not court danger, but assuredly he does not avoid it. The elephant may drink by his side, but must not interfere with him, for he is quick to resent an insult, and I am assured that when one of these battles takes place the rhinoceros is invariably the victor. The elephant is large, of gigantic power, but the other is far more active, while the formidable horn that terminates his nose is a dreadful weapon when used with the force that he has the power to apply to it. I have been told on trustworthy authority that a rhinoceros in one of those blind fits of fury to which they are so subject, attacked a large wagon, inserted his horn between the spokes of the wheel, and instantly overturned it, scattering the contents far and wide, and afterwards injuring the vehicle to such an extent as to render it useless.

The lion is not tied to time in drinking. After it feeds it comes to water, but it never would dare to interfere with the rhinoceros or the elephant. Where the buffalo exists in numbers it is the principal prey of the lion; in other localities antelope and chiefly the zebra are its food.—*The Great Thirst Land.*

ROYAL JEWELS AT THE PARIS EXPOSITION.—The English crown diamonds have been sent to the Paris Exposition, and are valued at \$85,000,000. They are in a strong iron chest and are guarded by eight sentinels day and night. A diadem of 86 diamonds of various sizes has in the middle the Koh-i-noor, alone valued at \$320,000. There is also a collar of 108 diamonds, in the center of which is an emerald, said to be the purest and most beautiful known. A second diadem is a blending of diamonds and emeralds. In the center is the large Kaudavassy diamond, valued at \$60,000. It would be rated at a higher sum only for a slight defect. These, and many other jewels of the kind, belong to the English crown. A portion is used by the Princess of Wales on special occasions; the others are reserved for the Queen. The Kaudavassy was formerly the eye of a one-eyed Hindoo deity, and has been only lately added to the collection. The French Commission are constructing a strong room for the State jewels. According to the *Journal des Debats*, it is about 12 feet deep and 10 feet or 11 feet square. The sides of the pit are thickly cemented, and it has a double iron floor, with pipes, by means of which it can be flooded in case of fire. The jewels will be exhibited in a glazed case of beautiful workmanship, a casket worthy of the gems; this will be let down into the space below immediately the Exhibition doors are closed, and covered with a heavy iron trap door, upon which two especial guardians will place their camp beds.

NO ROOM FOR MORE LABORERS.—The Eureka Sentinel says that 1,500 miners and laborers are employed in this district, and we have no work for others. Laborers are flocking here from all over the State, but they come only to meet disappointment. According to the Washoe papers there is a like surplus of laborers in the Washoe mines.

Sweepstake Plow Works.

On Friday of last week we took a run to San Leandro, Alameda county, to see what the Sweepstake Plow Company is doing in the home manufacture of agricultural implements. We found the works running a full force of men and turning out work as rapidly as is consistent with the high standard of excellence which the institution builds its success upon. Mr. F. A. Hill, who is known as a leader among the experienced manufacturers and successful inventors of the State, is still at the head of the works and gives his constant attention to all matters of construction and general business. Mr. Palmer, who conducts the office branches of the establishment, has his hands well filled with important work, and the wide area which is covered by the shops is resounding with the hum of industry.

Especially attention is now being paid to the building of headers. They are manufacturing the Baxter patten, which has been found very satisfactory in its working. Improvements have been introduced and particular effort is made both by designing and by quality of material to turn out a header of unusual strength, solidity and durability. Such qualities will be demanded in machinery to handle this year's crops, and anything short of powerful and effective implements will prove a vexation and a loss to the grain grower. The finger beam of the Baxter may be adjusted to run close to the ground, and it will pick up and elevate all heavy or lodged grain that can possibly be reached. It is fitted with an improved "double single gear," that is, the sickle and reel are run by one gear and the draper by another. Thus the draper may be stopped while the sickle and reel are still in motion, and the loaded wagon may be driven out and an empty one driven in without stopping the cutting. This arrangement enables the man who has timber or stumps in his field to cut all around them, and then start the draper again after the obstruction is passed and the wagon comes into line again. Fuller information concerning the header may be had from our advertising columns.

Another leading branch of the company's work at the present time is the building of spring wagons. These are being turned out in a variety of handsome and effective styles. There are airy and graceful buggies and phaetons, and very strong spring wagons one and two seated, covered and open, light and heavy express wagons. One pattern we noticed was a light business wagon, with springs hung upon jacks, so that they take up what they lengthen out, and consequently sustain a heavier load than springs attached in the ordinary way. Another pattern is a light side spring wagon, put up with patent equalizing rods which hold the body level when unevenly loaded and thus doing away with the tendency to tip sideways as in common side spring wagons. Another style is a heavy road or mountain buggy, with Hill's patent single-leaf spring connected with the equalizing rods. This is furnished either open or covered. Other patterns, into which the improved spring and equalizers enter, are a family wagon and carriage, a heavy express wagon, a three-spring long-panel bed wagon, with or without top. All these styles and varieties of wagons are made here, in a dry climate, from the best imported material, and while they do not compete in price with Eastern made wagons, they are put forward as much more durable because of the extra care in their construction and the more satisfactory conditions for durability under which they are produced.

The fine plows of Mr. Hill's designing are still selling in large numbers, although this is not strictly the plowing season. The Gillis horse-power, of which we have several times made favorable mention, is one of the specialties of the company. It is being widely introduced and is giving great satisfaction as a simple and cheap motor for raising water for irrigation and stock purposes.

We also were much interested in an iron wagon, the running gear being of Mr. Hill's invention, and the wheel of the Duval patent. It has a two-inch axle and is lighter than a wooden wagon of the same capacity. It is built on the truss principle throughout and this brings the weight of the load upon shoulders near the hubs, and not upon the central parts of the axle, as in wooden wagons. It has other points of strength and advantage which appear upon inspection, but which we have not space to describe at this time. It is a very interesting piece of mechanism and is being put to the test of actual work, with good show of success.

Mr. Jacob Price, of the Price Press Company, is putting up a new lot of his well-known hay presses, to meet the increased demand for this class of machinery in view of the heavy hay crop. The Sweepstake Company are also making for him an extra large excavator, for use on a 30-foot canal in Arizona. It is to have a capacity for excavating 600 yards of earth per day, with one man to manage it.

The Sweepstake Plow Company is a home manufacturing institution which is worthy of practical encouragement. A large number of men are employed and it promises to be one of the corner stones in our future as a manufacturing as well as an agricultural State.

Useful Information.

Agricultural Statistics.

In the House of Representatives recently, Mr. Burchard of Illinois made a speech in favor of repealing the bankrupt law. During the course of this speech he presented a summary of the increase in agricultural products since 1870, in order to show the material prosperity of the country. His figures were as follows:

	1870.	1878.
Acres cultivated.....	90,771,003	121,350,000
Horses.....	7,145,370	19,329,700
Mules.....	1,125,314	1,937,500
Milk Cows.....	8,985,332	11,309,100
Cattle.....	14,885,276	19,223,300
Sheep.....	28,477,041	35,740,500
Pigs.....	25,134,569	32,262,500
Wheat, bushels.....	235,854,700	300,000,000
Corn, bushels.....	1,094,255,000	1,340,000,000
Oats, bushels.....	247,277,400	405,200,000
Barley, bushels.....	20,295,400	35,600,000
Rye, bushels.....	15,473,000	22,100,000
Tobacco, pounds.....	250,028,000	480,000,000
Hay, tons.....	24,525,000	31,500,000

Mr. Burchard further states that the cotton crop this year will equal that of 1873, which was the largest which has been made since 1860. The net result of his statistics is that since 1870 the number of acres under cultivation in the country has increased by one-third, the live stock by from one-quarter to one-half, and other staple products in equally striking proportions. In view of these facts, it is easy to understand why the balance of trade for the past three years has been in our favor, and why the premium on gold has declined.

THE UMBRELLA.—From time immemorial the umbrella has been in use. At every point of Oriental story one encounters the symbolical umbrella in literature and art. In the fifth incarnation of Vishnu, when the god goes down into hell, he hears in his hand a sunshade. In like manner old bas reliefs represent Dionysus bearing a parasol when he is descending to the infernal regions. To be a King in the East has from the remotest antiquity implied a right to hear an umbrella; and to be preceded by umbrellas has signified royal quality in the persons following them. Indeed, the Eastern title with which we are more familiar than any other signifies King of the Eternal Kingdom. Satray is an abbreviation of a title signifying Lord of the Umbrella. No English fox hunter would care to ride to the coverside at the tail of a company of walking or mounted umbrella bearers; but when the Emperor of China goes forth to hunt he is preceded by 24 umbrellas. The Greeks used the umbrella as a symbol in some of their sacred festivals, and put it in the hands of gentilewomen. Bestowing it on their womankind of high degree, the Romans also elevated it in their halls of justice as a symbol of authority. A red umbrella was the symbolical canopy under which the Roman judge sat in the basilikon. The Cardinal's scarlet bat is but a modified umbrella. That our English umbrella has the same magnificent descent is shown by its name, which signifies sbademaker. Although the English did not invent the umbrella, they have done much to develop and bring it into perfection. Between October, 1786, and July, 1871, no less than 292 improvements on the ordinary walking stick were patented in England, and though some few of these patents refer to undraped batons, some 270 of them are for portable canopies. With so many fertile brains at work on its construction, the umbrella of the future must reach perfection.

PETROLEUM AS WAR MATERIAL.—Now that England and Russia are on the ragged edge of war, it is interesting to notice that the English Naval Architects are busily discussing all kinds of war construction and material. At the last meeting of their association a member read a paper "On Crude Petroleum Experiments for Purposes of Naval Warfare." There are various petroleum equipments, the best known of which consists of a steam cylinder, 15 feet long by 12 inches in diameter, to which is attached a pipe terminating in a nozzle at the bow of a torpedo boat. From this cylinder the Greek fire is ejected with great force, under a pressure of about 500 lbs. to the square inch. The writer believes that instead of counselling "no quarter" as a corrective of the use of Greek fire in modern warfare it should be reckoned as a factor in hostilities, and that steps should be adopted to provide our warships with means of defense against it. It was intimated in the paper that there are grounds for the belief that Russia has already recognized the validity of petroleum in war, and would probably have used it in the late contest if the experiments which led up to its adoption had been concluded in time. Admiral Selwyn, who expressed an ardent hope that warfare would eventually become so scientific as to be impossible, questioned whether a launch in attacking an ironclad under cover of the smoke of burning petroleum would not suffer most. He hoped the matter would be gone into in this country, for it was being well considered on the Continent. Mr. McIntosh went into a long description of what might be done by attacking land fortifications by the aid of lighted petroleum in a favorable wind. Dense fumes would drive the men from the casemates, while a small vessel with long range guns could destroy all the shipping in the harbor. Petroleum could also be used in shells, but he could not recommend crude petroleum.

AN APPLICATION FOR SLIPPING BELTS.—The use of leather belting is so much in favor that every device to prevent the drawbacks to which it is unquestionably subject, especially in careless hands, ought to be welcome. Heat and damp are two unavoidable conditions which exert an unfavorable influence upon leather. By the use, leather belts are dried up and cracked; by the other they are stretched unduly and have to be tightened, putting a strain on the shaft-bearings which they are never intended to sustain. Loss of power, extra wear and tear, and, worse than all, rapid deterioration of belts are the consequences. There are some common remedies for these defects of beltings, chief among them being powdered resin, which is applied to the inner surface of the belts, to make them "bite," much as a fiddle-bow is "roined" for the same purpose. In both cases the practice has the same termination—the resin accumulates as a hard layer, which has to be removed, sooner or later, not however before it has, especially with belting, done a considerable amount of harm. The fine dust produced in some factories, as in grinding or saw mills, has a similar effect, settling on the pulleys, and forming a layer of dust which prevents proper contact and causes a loss of adhesion. These drawbacks, says *Iron*, can be obviated by the use of a semi-glutinous, semi-oiled medium, such as has for many years been used in Switzerland, and is now being introduced in England. This compound, besides securing the right amount of adhesion, has the excellent quality of preserving leather. We are not informed of what this compound is composed, but the idea may set some of our inventors to study out a combination of substances which will answer the purposes.

SUBSTITUTE FOR SLATE.—The new composition proposed by Mr. J. A. Ditch, of Hastings, England, consists in mixing the various materials, or their chemical equivalents, in the proportions or near thereto, as hereinafter mentioned, for the purpose of providing, when applied as a coating to any convenient and suitable substance, a substitute for slate for building, writing and other purposes. The mixtures and proportions for coating substances for exterior work are—One quart of methylated spirit or its equivalent, $\frac{1}{2}$ lb. gum shellac, $\frac{1}{2}$ lb. flour of emery. For coating substances to serve as writing slates, add powdered glass, rotten stone, or pumice stone, together with lamp black or Paris green sufficient to give the desired shade of color. Other powdered substances, such as chalk, brick, slate or stone, may be used for the purpose of giving a body or abrading surface to the composition. A convenient way of making writing slates is to coat millboard with the new composition, frame the board, and mount it on an easel so arranged that it can be closed and shut up when not in use.

CLEANING CLOCKS.—Common brass clocks may be cleaned by immersing in boiling water. Rough as this treatment appears, it works well whenever they stop from dust or thickening of oil upon the pivots. Boil in rain water, and dry in a warm stove.

GOOD HEALTH.

Dyspepsia.

A writer for the New York *Independent* gives the following notes on dyspepsia: When there is a failure to dissolve the food which presents itself to the different organs of digestion, either wholly or in part, we have indigestion or dyspepsia. This we have also if the process is protracted beyond the normal period. When the saliva is deficient in quantity or inferior in quality there is one kind of dyspepsia; when there is a failure on the part of the stomach to secrete the normal quantity or quality of gastric juice, there is another kind of dyspepsia; and when the fatty elements of food fail to come in contact with the pancreatic and intestinal fluids necessary to emulsify them, there is still another kind.

Dyspepsia means difficult or imperfect digestion, and it is evident that there are three varieties, depending on the kind of food concerning which the difficulty exists. There may be failure to reduce the starch to sugar, to reduce the albumen to albumenose (liquid albumen), or to emulsify the fat. These difficulties may exist singly or combined. Generally they are combined, every stage of the digestive process being faulty. This is caused in no small measure by imperfect mastication. This act being imperfectly performed, there is an insufficient amount of saliva mingled with the food, and the food is so imperfectly divided that the digestive fluids act upon them slowly on account of the small amount of surface which is exposed to their action, and in this way the whole process becomes retarded and imperfect. If "baste makes waste" in other things, it makes double waste when applied to eating. It not only causes waste of food; it causes waste of vital energy, on account of the increased demand which is made on the organs to perform a difficult task, while at the same time the system is robbed of that nourishment which, with far less expenditure of energy combined with proper mastication, it would obtain.

LIP SALVE.—Oil of sweet almonds, eight ounces; white wax, three ounces; spermaceti, three ounces; rhodium, fifty drops, and white sugar candy forms an excellent lip salve.

Use and Misuse of Carbolic Acid.

In San Buenaventura there was recently a case of the misuse of carbolic acid by the injection of it into a wound. This fact has led a correspondent of the *Signal* to lay down the authorities on the use and misuse of this substance, and to call attention to a fact, which every good physician knows, that carbolic acid is a dangerous medicine, and must be used with the greatest care and by skillful hands. Dr. H. C. Wood, Professor of Materia Medica and Therapeutics in the Pennsylvania University, says: "The free external use of carbolic acid is by no means devoid of danger. Indeed, in more than one case, it has caused death. Two young men suffering from scabie, [itch] applied externally each about one-half an ounce of carbolic acid in a watery solution, one of whom was soon found dead." Dr. Wood recommends as an external antiseptic 100 parts of water to 1 part of carbolic acid. The county physician, judging from the effects and from the statement of a physician present soon after the injection was given, must have used carbolic acid 50 parts, and water or olive oil 50 parts. Dr. John I. Reese, in his *Manual of Toxicology*, page 342, says a man was nearly killed by having an ointment applied to his body consisting of one part of carbolic acid and four of lard. Dr. D. Gross, the best authority on surgery in the United States, says: "In the performance of operations in opening abscesses, and during the removal of dressings, carbolic acid may be used as a *spray*, one part of the acid to 100 of water, the necessary manipulations being conducted in carbolic acid atmosphere, which does away with injections as formerly practiced." From the above authorities it will be seen when used externally, carbolic acid, in comparatively mild solutions, is dangerous to human life. When injected, as it was, in a strong solution, so that it was taken up in the circulation, as in the case of Mr. Maddox, we can only wonder that the man was not instantly killed. The effect of carbolic acid is to arrest circulation, and to destroy the life principle in the blood. Indeed, there is no greater and more effective destructive agent to animalcule. One drop of carbolic acid and 499 of water, makes a solution strong enough to instantly kill plant lice.

WHAT TO DO FOR CROUP.—*Hall's Journal of Health* says: Croup is so common a disease among children that it requires no description; it affects the windpipe. As it attacks suddenly, most often in the night, and as an hour's time may be all the difference between life and death, it is proper to state the most reliable course to be pursued until a physician be obtained. 1st. Keep the feet warm by having a jug of hot water kept against them; let them also be well wrapped up in woolen flannel. 2d. Have a bucket of water almost as hot as the hand can bear. Have two pieces of woolen flannel of several thicknesses, one being on the throat while the other is in the hot water, renew every two or three minutes, until relief is given or the physician arrives. The water in the bucket must be kept hot by the constant addition of boiling water.

COAL TAR FOR FLESH WOUNDS.—Mr. F. D. Curtis informs the New York *Tribune* of what he considers the best application for any and all flesh-cuts and raw sores. It is gas coal-tar, which may be had at any gas-works where gas is made from coal. A barrel of it, costing \$2, has been in use at the Kirby Homestead for ten years and is not half gone yet. Coal tar, when applied to a flesh-cut, shuts out the air and thus stops the smarting; it will also keep off the flies; it is very healing, and it is antiseptic, that is, cleansing, and will prevent the growth of prond-flesh. It is the cheapest, most healing and best application we have ever used. I have tested this remedy for several years on all sorts of cuts and sores with the most gratifying and successful results. It was an experiment at first, but now it is a necessity.

DEATH FROM AN ORANGE SEED.—A short time ago, says the *Journal of Chemistry*, an only daughter of a physician in Cambridge died, with symptoms of the perforation of the bowels. It was found that an orange seed was lodged in the appendage called "appendix cæci vermiformis," which is about the size of a goose-quill. This produced a perforating ulcer that allowed the escape of the intestinal contents. Inflammation ensued that could not be controlled. No doubt thousands of orange seeds are daily swallowed, but this case shows the need of caution, and the tremendous power that resides in our food for evil as well as good.

LIME IN THE EYE.—The evil effects of lime in the eye are well known, plasterers and white-washers not infrequently having their eyes seriously injured, if not destroyed, by the caustic power of the lime. Wells says: "If the patient is seen soon after the accident, an effort should be made at once to neutralize and wash out the lime by a weak solution of vinegar, with a free use of the syringe. Afterwards, cooling and anodyne lotions and general antiphlogistic treatment should be adopted."

TO REMOVE FRECKLES.—Grate horseradish in a cup of cold sour milk; let it stand twelve hours; strain and apply two or three times a day. Or mix lemon juice, one ounce; pulverized borax, one-quarter drachm; sugar, one-half drachm; keep a few days in a glass bottle, then apply occasionally.

MINING SCIENTIFIC PRESS.

The Week.

Domestic events have moved on during the past week in their ordinary channels. The weather has been propitious for maturing the cereal crops, furthering hay making and all our other out-door industries. The abundance of water has greatly stimulated and extended the business of mining, promising at the same time to prolong the season of active operations. Through the partial utilization of our petroleum deposits, a new and somewhat important interest is likely to grow up in the southern part of the State, where an excellent lubricating and illuminating oil is being produced in considerable quantities. Many of those without employment during the winter are now getting work, and as the cost of the leading articles of subsistence has diminished with the prices of wages, our laboring population find themselves, as a general thing, in a tolerably easy and comfortable condition.

The Phoenix mine, Amador county, has ordered an outfit of drilling machinery from the National Drill and Air Compressor Company, consisting of a large duplex air compressor and a number of drills. Supt. Green ought now to have all the work he wants for that 80-stamp mill.

Things that Call for Correction.

Judging from the statements and tone of our exchanges, received weekly from all parts of the Pacific States and Territories, the business of mining for precious metals was never in a more prosperous and hopeful condition than at present. The note of despondence, heard even this early last year, has given place to a general expression of cheerfulness and content, the greater care and economy enforced by a season of drouth telling also beneficially on this industry. With a falling off here and there the metallic harvest will be more than an average, the total hulsion yield for the year being estimated at something over \$100,000,000. And now, when we appear about to enter upon an era of enlarged production and greater prosperity, seems a good time to take a look over our past history and see what there is in it calling for avoidance and amendment; for, with all our improvements and progress, our course has been marked by many blunders and mistakes. And in this we do not allude to those errors of judgment, which, in our inexperience and the novelty of our surroundings, might find some excuse, but to those that we have committed and still commit in the every-day practical prosecution of this calling.

And, first, of that wide departure from legitimate business principles that grew up with the introduction of stock operations on this Coast, and which, in the name and ostensibly in the interest of mining, has done so much, if not to retard, at least to bring that industry into questionable repute. We are not going to inveigh against the practice or business of dealing in mining shares wherever or however conducted. Let those who choose to engage in that vocation do so, but let it be understood that it has no necessary connection with the business of gold and silver mining, or rather, that, as usually conducted, it is antagonistic and hurtful thereto. And since these two callings have no real connection we should not suffer them to be longer associated in the popular imagination. It is claimed that assessments for carrying on mining developments cannot be collected except under the stimulus of speculation or a prospective "deal." The answer to this is that the mines that can be opened up only through this unwholesome excitation had better remain undeveloped. All we wish to be understood as saying, however, is that the financial ruin that has overtaken so many who have adventured their means in stock operations should not be attributed to mining itself, and to protest against these losses being charged to its account; adding this word of advice to miners themselves, better trust to the pick and gad to bring you out than seek to get your claims represented on the Stock Board or allow them to be controlled by share manipulators and sharps, who, if you have anything worth going after, will assess you "out of your boots."

But it is not only stock speculations in San Francisco that are to be avoided; there are many abuses in the field that call for correction. Mining to be made generally profitable must be carried on with more care and economy than has heretofore been observed on this coast. The services of more patient and capable men, especially in the reduction department, must be secured. We do not work our ores with enough cheapness or closeness. There is no longer any good excuse for this. Chemically our ores are not essentially different from those found elsewhere, and we have now had a somewhat lengthy experience of our own superadded to that of other countries. It is time we were doing less costly and more effective work in this line. In the matter of curtailing expenses, retrenchment should be practiced in everything except the mere item of labor. It is the dead weight we must try to get rid of—the fancy offices, useless officials, etc. Our mines—no mines can stand up under this burden of expenditure. It is too much to ask of them—more than we would require of any other business. We must order a halt on this line and do it at once.

It is a bad habit our miners have, this of rushing in great numbers to localities in which a rich ledge has been discovered or other mineral strike announced, congregating there often largely in excess of what either the labor demands or the prospects of the place will warrant. In this way these new districts, with all their resources, come to be about the poorest place to which either the workingman or the prospector can go. Indeed, the man who sticks closest to the old camps is apt in the long run to do the best. Of this we have had many notable examples here in California. In alluding to this evil, we are reminded that the local press is apt to represent these strikes occurring in the neighborhood in colors a little too glowing, considering how prone our migratory population are to accept everything they see in print as simple and unadorned fact. It is to be feared, in fact, that we are all a little given to exaggeration in these mining matters, as witness the daily discovery of so many Comstocks and veritable Bonanzas at all points of the compass. A little less hyperbole in this department of news would be agreeable for a change, and in the long run answer, perhaps, just as well. If a claim or camp possess merit, it is sure to be found out and appreciated, while there is hardly a defunct district in the country but has some day, or another been unduly puffed. Let us work more and "blow" less.

The Grand Musical Festival.

It is fitting that a year of great promise should be a year of song. As our grain fields are maturing their heavy produce and as our mining and manufacturing industries are feeling the impetus of favorable conditions, it is proper that our people should embody their feeling in an outburst of melody, than which grander, perhaps, was never heard upon the continent. Arrangements are being pushed forward which promise that the great May Festival, which has been announced before in these columns, will be in every way successful—a credit to the musical ability of our coast and to those who are giving time and effort to bring it together. At Mr. Bugbee's office in the Nevada block everything is in a bustle of preparation. Communications are pouring in from all quarters announcing the progress of rehearsals among the musical societies of the interior, and the interest of the people in the coming event. The sale of season tickets is immense, and the running of excursion trains from Stockton, Sacramento, San Jose and Salinas, and excursions by water from Portland, will give all a chance to attend the festival at a reduced rate.

The alterations at the pavilion are nearly completed, and there will be arrangements to seat 10,000 people daily. This concourse, together with the 2,000 singers and 300 instrumental performers, will give a scene like that presented in the large engraving in the announcement in our advertising columns in this issue.

The famous Eastern musical director, Professor Carl Zerrahn, will arrive in a few days and will be serenaded at 8:30 P. M. on Sunday evening, at the Palace hotel. There was a general rehearsal on Thursday evening of this week, which was largely attended and gave a forecast of what some branches of the performance will be. There will be full demonstration of the effect produced by the weaving of the magnificent in sound into the fabric of musical composition. Artillery will be fired at proper points by electrical connection, and the large city bells will be struck in tune by the same agency. The artillery will be composed of one battery from the Presidio barracks; also a company of the militia. The festival promises to produce gala days in the city. The Oakland Light Cavalry have volunteered to escort the Governors of Oregon and Nevada on arrival. On Thursday, May 30th, there will be an excursion on the Bay for the entertainment of the country singers.

The festival bids fair to give a practical demonstration of the recent advances in electrical apparatus. The final rehearsals will be connected with telephones to different parts of the city.

A monster phonograph has been telegraphed for, and there is a prospect that this wonderful machine may be made to reproduce some of the melody for the amusement and instruction of the audience.

These few hasty notes of the movements which are now being carried forward by Mr. Bugbee and his able corps of assistants will give the reader an idea that something altogether new on this coast will be produced. The telegraph is bringing news that the great musical festival at Cincinnati is proving a grand success, and a greater than this will be in San Francisco.

FOAM AND SPRAY IN HYDRAULIC WASHING.—The owner of a hydraulic claim on Scott's Bar, Siskiyou county, writes to the PRESS, complaining that the water from his nozzle, under a 460-foot pressure, comes out foaming and full of spray, and asking how the same may be remedied. The trouble probably arises from some one of the following causes: His discharge pipe may be too short, not allowing the water a chance to collect after entering it; or the pipe may not be properly "rifled," again, there may be some obstruction to the free passage of the water into the pipe. Then the size of the nozzle may be too small for the volume of water and pressure. If the diameter of the aperture is less than two inches this is most likely the source of the trouble. If "Miner" will write us describing the shape and length of his discharge pipe, how his feed is connected with his supply pipe, with size of same and diameter of nozzle, we will be better able to advise him in the premises.

A PURGATIVE SPRING IN CALIFORNIA.—In the interesting article on the Medicinal Springs of California, prepared by John S. Hittell and published in the PRESS, April 27th, it is stated that the mineral springs on this coast possess all the medicinal virtues found in the most celebrated waters of Europe, save the purgative property. From an intelligent gentleman who has extensively explored the mountains in the southern part of the State we learn that he some time since discovered a spring in that quarter which possessed mild but marked cathartic powers, the water having been amply tested in that respect. This then supplies what has been a desideratum in our mineral springs, and as such will be likely to give to this discovery a special importance.

PETER COOPER, of New York, was first a coach maker, then a cabinet maker, then a grocer, and failed in all. In his fortieth year he began making glue, and made the foundation of his fortune, now estimated at \$10,000,000.

The Tin Ores of Montana.

A correspondent, writing from Butte City, Montana, says they have in that part of the Territory a large scope of country covered with float tin ore, which, according to assays made at Denver, carries 73% of that metal, and wishes to know what grade of this ore will pay to work or ship. In a locality where labor is so dear, and the cost of transportation to market so great as in Montana, it is doubtful whether 73% tin ore would possess any commercial value. In the stannaries of Cornwall 2% ore, worth say \$15 per ton, can be mined and manipulated with profit. But there wages, even for highly trained labor, as well as fuel for smelting are extremely low, while a market is always at hand, and the somewhat complicated and costly machinery required for ore dressing, has been brought to the greatest perfection, all of which conditions are wanting in Montana, the situation there being in fact, wholly reversed. In England the assorting and dressing of the ore is performed mostly by women and children, who, through long education, become adepts at the business, their wages ranging from four pence to ten pence per day. This ore has to be freed from all foreign matter or the smelters will not buy it. The least impurity renders it difficult to smelt, the presence of quartz being especially objectionable, as it forms a silicate of tin that interferes seriously with its successful reduction. Long practice renders these cheap laborers so expert at the business, that not a particle that should be removed escapes their eye, wherefore the ore goes to the concentrator as clean as it can be made by hand. This is a difficult ore to concentrate by machinery, being often accompanied by substances as heavy as the metal itself. The smelting of this ore is simple enough if a small loss of metal be disregarded, the preceding operation of roasting requiring, however, more experience and care.

We should be glad to learn that profitable stannaries had been opened in Montana, but are not sanguine that this result will be reached until the price of labor and transportation shall be reduced, or a higher grade of tin ore found in that country. It is long since we gave up looking for any large out-put from the tin mine of Temescal, in the southern part of this State, although some specimens of extremely rich ore have been obtained there, and it was confidently expected that it would, years ago, have become a source of large wealth to the owners.

NOT ALTOGETHER NEW.—We stated in our last issue that a correspondent of the *Jeweler* had introduced a self-calculating method for assaying silver at certain smelting works, which seemed both new and useful. On referring to the "Explorers," *Miners* and *Metalurgists' Companion*, by J. S. Phillips, M. E., of this city, we find that these calculations are by his method entirely avoided both for ounces and dollars per ton, and for thousandths fine, both for gold and silver, as well as the percentage for base metals and fluxes, this subject, commencing on page 219 of that work, being extensively treated of. Mr. Phillips has, in fact, been very prolific of modes for avoiding figures, as well as comprehensive on the necessary calculations of values in his book.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Modoc, May 8th, \$4,600; Tybo Con., 6th, \$8,280.69; Manhattan, 10th, \$14,296; Standard, 7th, \$41,399.25; Northern Belle, 8th, \$2,083.26; Star, 11th, \$6,000; Modoc, 9th, \$8,181.53; Justice, 11th, \$7,116.14; Tybo Con., 10th, \$4,292.53; Modoc, 11th, \$4,195.16; Star, 14th, \$4,300; Manhattan, 14th, \$13,000; Northern Belle, 11th, \$3,138.99; California, 13th, \$11,905.09; Con. Virginia, 13th, \$71,207.51; Christy, 15th, \$4,312; Hussey, 14th, \$2,800; McCrackin, 15th, \$31,266.69.

THE MINING AND SCIENTIFIC PRESS will be represented at the Paris Exposition by Mr. Robert Grimsley, who leaves New York this week. He will gather there whatever will be of interest to the readers of the PRESS, turning his attention more particularly to improvements in the line of mechanics and mining.

An explosion took place in the coal bunkers of the steamship *Sardinia* on her way from Liverpool to Quebec, killing two of the crew and seriously wounding many of the passengers. The vessel was run ashore, scuttled and sunk in 30 feet of water. She cost \$800,000 and was uninsured. Attempts will soon be made to raise her.

THE California Pacific railroad, between Vallejo and Sacramento, upon which through travel has been interrupted for several months in consequence of the washout, will soon be in running order again, a large force of Chinese having been set to work repairing it.

THE corner stone of the shop of the engineering department being erected in the navy yard at Washington, is a mass of metal, weighing five tons, obtained by melting down counterfeit plates and dies captured by the detectives of the Treasury Department.

Japanese Porcelain.

[By C. W. GENSEL in *Dingler's Polytechnic Journal*.
Translated for the MINING AND SCIENTIFIC PRESS.]

Japan is well known for its richness in fine clay. The raw material even is so pure that it can be used to produce the justly admired porcelain ware of that country. The center of this porcelain manufacture is the city of Arita, in the province of Hizen. In a very small circle about this city are found all the necessary materials of such purity that they can be simply ground and elutriated without further mixture, and made into the finest "egg-shell porcelain." Besides this material is found in the middle parts of Nippon, where granite predominates, in the provinces of Owari, Yamshiro and on the island Awajishima opposite Hiogo, where the beds are very similar to those of Bohemia. For the preparation of porcelain this substance is mixed with siliceous and felspathic earth from other adjacent regions. These materials have but just now been prospected petrographically, and have scarcely yet been chemically examined.

I seize this opportunity to add a few contributions upon some material from the neighborhood of Arita, which I received through the kindness of the Japanese Exhibition Commissioner, Prof. Dr. Wagner, of Vienna. This substance is peculiar in possessing throughout a stony rather than an earthy appearance, and six specimens of it resemble a white or pale yellow clay stone (*Felsituff*), possess a tolerable hardness, about that of brick, is compact, not porous and apparently quite homogeneous without noticeable admixture of minerals, and only one specimen is friable, soft, and like our (the German) porcelain earth. This stone-like material we will for short call *porcelain stone* in contradistinction to porcelain earth. It consists when examined under the microscope in thin sections of a tolerably water-clear matrix which is more or less mixed with the finest dust-like particles, the minutest grains, bubbles, little needles and irregular fragments. They have no definite recognizable crystalline form, but show under polarized light the well-known play of colors, which belongs to crystalline rocks. Amorphous admixture was not observed in any noticeable quantity. On the other hand there swim in this matrix, in one sort commonly, in the rest less often, little heaps, or grain-like aggregations. These prove to be balled together of little round grains, irregularly, now long, now zigzag flocculent clouds which are opaque. Near them appear irregularly shaped particles of the matrix more uniform in composition of a yellowish hue. With the exception of the smallest water-clear, short splinters perhaps of quartz, feldspar or mica—there were no mineral separations. There were only found in most of the specimens little crystals of pyrites, which were sometimes united in little heaps, or when decomposed form yellow spots or streaks. In single specimens one notices curved cracks, and parallel stripes which call the varicose structure. The whole resembles in the most striking manner a felspathic or trachytic clay-rock, such as is found in Hungary in the trachytic districts.

This hard porcelain stone appears to be peculiar to the Japanese as well as the Chinese porcelain manufacture. The porcelain earth-like, soft earthy substances can serve only as admixtures to the other firmer varieties. This earthy mass consists of similar crystalline water-clear, and opaque particles, as well as the stone-like, only these loose fragments are not bound firmly together by a matrix. A chief constituent of this mixture seems to be silica or a silicate of alumina. For according it was impossible to remove but a minimum of the silica by boiling potash. This would all dissolve were it in the amorphous condition. This being accepted, a clay-like nature seems to show itself in my analyses. The characteristic of this substance seems its richness in silica and its small amount of water. So far as I know there is but one other chemical analysis of a Japanese clay which has been published, viz: that of Malaguti of Sevres. This appears in column A:

	A	I	II	III	IV	V	VI
Silica	73.90	70.74	77.35	83.00	80.00	79.73	49.25
Alumina	20.00	21.75	14.97	11.50	12.00	12.45	38.53
Iron oxide	—	2.02	2.11	0.70	0.50	0.67	1.14
Manganese Oxide	—	—	—	—	—	—	—
Lime	—	0.72	0.15	—	0.03	0.61	0.15
Magnesia	—	0.02	0.29	0.13	0.25	0.14	0.36
Potash	—	3.23	1.73	1.90	2.40	1.71	2.01
Soda	—	2.43	0.32	0.09	0.57	0.27	0.39
Lithium, sulphur, etc., in different materials	—	—	—	—	—	—	—
Water	—	—	1.09	—	0.60	0.38	0.65
			2.76	2.43	3.00	2.24	5.90
100.00	100.91	100.12	100.60	99.15	98.20	98.74	

- I. Good Japanese white porcelain.
 - II. Porcelain stone with distinct particles of pyrites.
 - III. Slightly yellowish porcelain stone.
 - IV. Dazzling white porcelain stone.
 - V. Porcelain stone containing pyrites.
 - VI. Dazzling white, soft, fragile porcelain earth very similar to the European, but contains considerable less water.
- In general the composition is tolerably varying, but not more than is usual. If we compare the analysis of the raw materials with that of the manufactured burned porcelain (I), it will be clear at the first glance that this latter can be made only through an admixture of the clay made by pounding and elutriating the porcelain stone with the natural soft porcelain

sarth (VI). They must mix about two parts of the first kind with one part of the latter. But in order to produce such a high percentage of alkalis there must probably have been added feldspar powder in addition, or as in China, add limo. This latter is there burnt

Fig. I.

FORMS OF STEAM QUIETING NOZZLES.

with the stems of ferns, probably to be able to utilize the alkali of the ash of the latter. The molded and dried porcelain is then dried in small furnaces. In fracture, the Chinese porcelain is a little reddish and glistening,

Fig. III.

while the Japanese is of a dazzling white color, and has a beautiful white glaze, this is still considerably heightened by the painted colors which are added. But this painting is mostly thin, peels off, and is consequently not very durable.

Steam Quieting Nozzles.

There are many instances unpleasantly common, when the noise of escaping steam is both annoying and prejudicial to health; and it is often a source of danger and loss.

This familiar "coughing" of locomotive exhaust-nozzles is not only a noisy nuisance, but this peculiar mode of exhaust causes instead of a full, steady and efficient draft through the grate-bars, flues and stack, a bodily lifting of large and small particles of fuel, and their dis-

Fig. II.

charge into the open air or against a screen placed to detain them and diminish the number of road-side fires caused by their means. This waste of fuel from locomotive stacks is enormous; in some test cases being shown to be about one-third of a ton of coal per day per engine. The sparks and cinders besides causing damage by fire, occasion lesser annoyances; such as pain or injury to sight of passengers and the cutting of the paint of cars. A marked disadvantage of the present arrangement is that in reversing, cinders are apt to be drawn into the cylinders, then causing damage. The sharp-shooting sound of the exhaust frightens green and mettlesome horses, causing accidents in the country and forcing railroad companies to employ long and blocking teams of horses for draft of freight cars in cities, and also pre-

WINTERS' IMPROVED DERRICK.

venting the employment of steam on our city railways. The noise of escaping steam is always a nuisance, whether from a locomotive, steamer, or ordinary engine.

Mr. Thomas Shaw, of Philadelphia, (well known for his "gun-powder-pile-driver," differential pressure gauge, dead stroke hammer, etc.,) has devised two modes of quieting escaping steam. It is an exhaust nozzle for locomotives and is shown in figure 1 of the accompanying engraving. It is the form used in stacks of contracted area, and is a simple, straight tube closed above, and having a number of smaller ones bent at right angles and screwed into it as outlets.

Fig. 2 shows a locomotive with increased diameter of stack, and longer smoke-arch, and having a larger cushion-pipe, M, with an expansion chamber, K, from which branch off a number of exhaust nozzles, J.

The spiral device is shown in vertical lengthwise section in Fig. 3, as made for exhaust nozzles, safety valves, brake discharge pipes, etc.

A is the base bearing bars, b b, supporting a coil of wire of such diameter and length that, when compressed nearly to contact, the spaces between the turns of the coil will have a total area much larger than that of the steam escape pipe. The upper tightening spring, g, enables the coil to be kept at the proper tension.

The rushing steam lifts the cap plate, c, opening the coils which receive all the vibrations, but by touching against each other completely neutralize them.

The device is claimed to be effective in quieting the noisiest safety-valves, and this opinion is well endorsed by those competent to judge, and by reports based on actual working.

An Improved Unloading and Stacking Derrick.

An engraving on this page represents an improved unloading and stacking derrick, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by John D. Winters, of Grand Island, Colusa county. This device may be used in the process of heading and threshing and for stacking hay and straw. With it wagons may be unloaded at the rate of one per minute. The derrick can be taken down and put up again in a few minutes, and it will unload and stack from two 16-foot headers at the same time.

The netting is made in two parts. On one of the parts the ropes of which the netting is made extend beyond the rail which is nearest the point where the two parts of the netting are to be connected. Each two adjoining rope extensions are connected together at their ends and a ring attached at their point of friction. This gives a number of rope extensions outside of the rail, all of which are of equal length and each having a ring attached to it.

The rail of one part of the netting is provided with an equal number of straight pins, which project at right angles from the face of the rail. This rail is also provided with a short arm at its middle, which also projects at right angles, and to the end of this arm is attached a link, chain or rope. In the middle of the next adjoining rail is a detaching apparatus, operated by a cord. To connect the two parts of the netting together in order to receive a load, the rings are placed over the pins in regular order. The rail is then turned around, so that the rings will draw against the face of the rail. The link or chain is then connected with the detaching device and the netting is ready for use. The pins will then hold the rings against any strain that the parts will withstand. To disconnect the two parts and dump the load, a slight jerk upon the string or cord attached to the detaching apparatus will allow the parts to separate and drop the load. This arrangement is extremely simple and strong. It avoids the necessity of using a spring or other device of doubtful strength or action.

The derrick is mounted on a wagon as shown and has a suitable device by which it can be raised from a horizontal to a vertical position upon the wagon. A cross-bar placed over the front axle sustains the derrick, with the usual swivel secured on the base bar that is held by journals or boxes or ring-bolts, on which the derrick swings when upright.

The forward end of the frame work projects as far as practicable and sustains a cross-bar having a jack frame hinged to it in any suitable manner so that it can also be raised or lowered. At the top of the frame a rope passes over a pulley and is fastened near the upper end of the derrick.

When transporting the machine from place to place the derrick and jack frame are lowered to a horizontal position; but when it is desired to use the derrick the jack frame is first raised by hand and secured in a vertical position as shown in the engraving. The derrick is then raised by means of the rope passing through the pulley block at the top of the jack frame, and secured in any suitable manner.

The arrangement is very simple and admits of the derrick being conveniently carried on the wagon and raised quickly and easily to a vertical position when desired.

By combining the two inventions of Mr. Winters a very useful arrangement for unloading wagons, etc., is formed, as any farmer can see at a glance. John Morgan, Davisville, Yolo county, is manufacturer, and may be addressed for further information.

MONTANA FAIR.—We have received a neat pamphlet containing the premium list, etc., of the ninth annual fair of the Montana Agricultural, Mineral and Mechanical Association, which will be held at Helena, beginning Monday, September 23d, and continue six days. The officers of the association are: President, W. A. Chessman; Vice-President, S. H. Crouse; Treasurer, T. H. Kleinschmidt; Secretary, C. G. Reynolds; Directors, J. F. Taylor, W. A. Chessman, S. C. Ashby, W. G. Prentiss, T. H. Kleinschmidt, Timothy Wilcox, A. J. Davidson, S. H. Crouse, Francis Pope. The premiums are liberal in all classes of exhibits, and the fair will doubtless be a successful one.

A STEADY DECLINE.—The gold production in Victoria, Australia, has been steadily decreasing ever since 1866, when the yield amounted to 1,536,581 ounces and the number of miners was 73,749; diminished to 792,839 ounces in 1877 with but 33,882 miners,

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.
The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

This is necessary to protect us and subscribers against the acts and mistakes of others.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 222 Sansome St., San Francisco.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento Valley. His advertisement appears from time to time in this paper.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, \$7.50. Postage, 50 cents extra.

MINING AND SCIENTIFIC PRESS. \$4 a year. Published weekly at San Francisco, Cal. Our western friends will find this the most readable of papers, it being filled with full of good things. We are always anxious to read each number.—*Indianapolis Mechanical Journal.*

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Ropes of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

25 STYLES OF CARDS, with name in gold, 10 cents.

DEWEY & CO. American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. FINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes mis-carry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

GOOD LAND

— IN A —

FAVORABLE LOCATION,

GUARANTEERING

Sure Crops Every Year.

The Reading Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends some 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is very healthful and comparatively desirable. The near proximity of high mountain peaks give cool nights during the "heated terms" which occur in our California summers.

Soft well water—remarkably sweet, pure and healthy—is obtainable at a depth of from 15 to 35 feet.

Wood is plentiful and easy to get.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,

Anderson, Shasta Co., Cal.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachape Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains, Calabazas, in the valley of Santa Cruz; Coronacion Peak, the Arivave Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the notes-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA, Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

PAYOT, UPHAM & CO.,

Publishers and Wholesale Stationers, 204 Sansome Street, San Francisco, Cal.

Also, for sale at the above prices by

DEWEY & CO.,

Publisher of the MINING AND SCIENTIFIC PRESS, S. F.

ARCHITECTS.

We are continually designing Suburban and Rural Residences to meet the wants and means of all classes of people, always endeavoring to secure an effect of beauty on the smallest cottage, as well as the most costly residence.

Our charges for furnishing drawings of the building shown in this issue of the Press, all complete, with specifications, will be \$75.

By our economy in the construction of buildings and the proper selection of materials, we save far more money to the owner than our fees amount to.

Before choosing a home, a copy of Hobbs' Suburban and Rural Architecture should be obtained, a beautifully bound volume of 122 designs, which we mail post-paid, for \$3.50. Those who remit direct to us, will receive in addition to the book, 15 new designs.

Upon receipt of \$2 we send a copy of our blank forms of specifications and bills of quantities. They are invaluable to all persons about building, and for carpenters and builders who build without the aid of an architect. They are especially valuable, as they bring before the mind all the different parts used in the erection of a building, so that nothing will be left without consideration.

Address all letters of inquiry to the architects,

ISAAC H. HOBBS & SON,

NO. 804 N. Eighth Street, Philadelphia, Pa.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 29th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
 One man, per day.....\$ 3 50
 One man, per day.....3 00
 Wood, 1 cord at \$3.....7 00

Cost of 20 tons.....\$13 50
 Cost of one ton.....67½
 From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

R. HOE & CO.'S CHISEL TOOTH MILL, SHOP, And Edger Circular Saws with Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Filees are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in Mining and Scientific Press.

News in Brief.

THERE were 89 deaths in the city last week. J. G. FAIR, of the bonanza firm, is again sick at Virginia City.

LOS ANGELES is making large exportations of corn to Mexico.

EIGHTY THOUSAND persons visited the Paris Exposition on Sunday.

THE "bell punch" liquor bill is likely to become a law in New York.

TOBACCO smoking has doubled in Great Britain during the last 30 years.

DIPHTHERIA has been prevalent at Middletown, Lake county.

SINCE the settlement of Lake county there has never been a failure of crops.

AS THE prospects for peace improve the prices of wheat decline in the English market.

ON the 12th of May it snowed steadily all day in the Black Hills region.

JOSEPH F. DEMANS, 12 years old, was drowned in Bear creek, Merced county, May 9th.

PROF. JOSEPH HENRY, for many years head of the Smithsonian Institute, is dead.

AS the game laws of this State are now in full force, the sporting fraternity should beware.

GOVERNOR EMORY of Utah predicts that female extravagance will eventually kill Mormonism.

THE earthquake at Maniziles, South America, did considerable damage to houses, but no lives were lost.

THE value of Peter's pence and other offerings made to Pius IX. amounted to no less than \$95,000,000 in all.

EIGHT car loads of wine have just been shipped from King's cellar, in St. Helena, Napa county, to St. Louis.

A NATIONAL convention will meet in London and protest should the English government determine to go to war.

CHARLES E. LEE, who had just arrived in the Black Hills, was found murdered and robbed, near Deadwood, on the 12th inst.

THE wages of operatives in the New England factories are being generally cut down about four per cent., on account of the hard times.

THE customs officers at Havre will not permit arms from the United States for the Russian government to be landed.

D. SHEPARDSON, tried last week for the murder of Arnold, City Marshal of Colusa, has been acquitted.

LUX AND MILLER are said to own about 700,000 acres of land in this State, on which they pasture 50,000 head of cattle.

"COBURN GEORGE," an Indian celebrity residing near Truckee, was run over and killed by a Central Pacific train the other day. He was drunk at the time.

CARMELLO is the name of a new town just laid out at the whaling station on Carmello bay, near Monterey. A glass factory is the first proposed enterprise.

THE members of the San Francisco Police force have been notified that from this time henceforth they will not be permitted to smoke pipes, cigars, or cigarettes while on duty.

OUR army of 25,000 men costs nearly \$26,000,000 a year, the English army of 133,720 costs but \$63,219,500; the latter being a yearly cost of \$473 per man and ours \$1,050.

At a walking match in New York the other day A. Harrison, of Haverhill, Massachusetts, made 160 miles in 34 hours, 29 minutes, and was awarded the first prize.

THE Free Labor Exchange last week furnished employment to 114 persons, of whom 91 were men, and 23 women and girls. Of the men, nearly half went into the country.

At Victoria, B. C., no public house is allowed to remain open on election days, neither can liquor be sold or given away, under heavy penalties.

REV. HENRY WARD BEECHER will arrive in this city about the 10th of August, his object being to lecture here and in other cities on this coast.

CHARLES MORGAN, owner of a steamship line between New York and New Orleans, with steamers in the Texas trade—21 in all—died last week, worth \$13,000,000.

THE Alaska waters contain more salmon than all the other waters in the known world. Within a few years salmon canneries will be established along the Alaska coast. Already the Pioneer cannery of Alaska has been located at Klawak, on Prince of Wales Island.

GEN. GRANT, wife and son are in Paris. GORTCHAKOFF is weaker in consequence of a fresh attack of gout.

THE 342,595 pensioners on the pension lists will this year cost our Government \$29,371,537. MORE parties, claiming to be relatives of the late A. T. Stewart, are suing for a portion of his estate.

THOMAS DREW, a native of England aged 69, dropped dead while raking hay on his ranch in Santa Cruz county, May 2d.

STANLEY, the African explorer, was, it is said, born a little over 30 years ago in a Welsh poorhouse.

THERE was a heavy snow-storm at Muscatine, Iowa on the 11th of May, with frosts in Ohio and Indiana, but no serious harm done.

EXTENSIVE strikes followed by lockouts, riots and suffering have occurred among the spinners and weavers in England and Scotland.

FRANK DUSY has sheared this spring at his corral at Fresno 43,000 head of sheep, and Foster & Morrow about 50,000 head.

A STEAMSHIP line under the auspices of China and Peru has been opened between Hongkong and Callao to facilitate Chinese emigration to Peru.

JOHN A. McDONALD, who has been a member of the Legislature, of a State convention, Presidential Elector, etc., is now at work in Raleigh, N. C., as a common laborer, equally respected as when he held office.

HEAVY failures have occurred in Liverpool, and it is feared many more will soon follow owing to the great depression in most branches of trade.

THE chair factory at Forestville, Sonoma county, is now running out 100 chaires per day, mostly of the old-fashioned style with rawhide bottoms.

ON the 11th inst. Emperor William, while returning from a drive, was fired upon but escaped unhurt. The assassin was arrested after firing two shots, both balls lodging in the Emperor's carriage.

IT is announced that all white men who desire work may obtain it by applying to the Central Pacific Railroad Company, who are in need of workmen to repair the break on the California Pacific.

PROF. MARTIN made another balloon ascension from Woodward's Gardens last Sunday. After being up an hour and a quarter, and reaching a height of 5,000 feet, he landed safely in Alameda.

THE rainfall the present season has been at Shasta 95 inches, while at Bakersfield it has been but eight inches, the former being about the wettest and the latter the driest locality in the State.

THE Supreme Court of Massachusetts has decided that a note given for a church subscription does not carry with it an obligation to pay, since it is given without consideration.

NO TROUBLE with Sitting Bull is anticipated within the limits of the department, but General Crook to be prepared is sending scouting expeditions north and northwest of the Black Hills.

REPORTS from 29 States and one Territory indicate the largest crops of all kinds this season ever had in the history of the country. The increased acreage of wheat in the Western States is very large.

IT is believed the Jesuits and violent party have triumphed at the Vatican, which, it is said, has resolved on a policy of resistance, all negotiations with Prussia and the other powers having failed.

THERE is a rumor that secret negotiations have been for some time on foot for the enlistment of a corps of five or six thousand Irish soldiers to be sent to Russia for service against England.

IN his report on the proper terminus for the Canada Overland Railway, Admiral De Horsey, of British Columbia condemns Burrard Inlet and Skeena river as harbors, and strongly favors the adoption of the Bute Inlet route, with Esquimalt as the terminus.

WM. CARTER shot and instantly killed Jesse Hankin, his son-in-law, near St. Helena, Napa county, not long since. Hankin's wife left him shortly after being married and returned to her father's, which caused bad blood between the parties.

THE funeral of John Morrissey took place from St. Peter's Catholic Church, at Troy, N. Y., and was attended by an immense concourse. The entire State Senate, with Lieutenant-Governor Dorsheimer and a delegation of Assemblymen, were present. Bishop McNierny, of Albany, assisted at the religious services.

Photographic Improvement.

Mr. I. W. Taber, one of the best favorably known photographers in San Francisco, contemplates a new departure from his present rooms, No. 22-26 Montgomery St. His new enterprise is spoken of by an exchange as follows: We are reliably informed that I. W. Taber, the well-known photographer of this city, has secured a three years' lease of the upper portion of the new Hibernia Bank building, to be erected on the corner of Montgomery and Post streets. This building, when completed, will be one of the most imposing in this city, and we congratulate Mr. Taber on his foresight and energy in securing, in the face of a strong competition, what must be considered the very best location in San Francisco for a first-class photographic gallery. The Hibernia Bank managers intend to arrange the entire upper portion of their new building, 60x90 feet, for the purpose named. From the plans shown us, this gallery will be the most complete and best arranged of any in the country, and we doubt if it will have its superior in the world. The main entrance, eight feet wide, will be on Montgomery street, which, leading to a large elevator, it will lift the visitor directly into the "Taber Photographic Parlors" on the third floor, which will consist of a large general reception room, three private parlors, three retiring rooms, store room and laboratory, two studios for artists, business office, etc. From this floor a broad stairway will lead to a second operating room of glass above, which will be provided with all the latest improved instruments for taking the most elaborate and perfect pictures known to the art. Telephone communication will be made with the Palace, Grand, Lick, Cosmopolitan, Occidental, and possibly the Baldwin Hotels—all of which, excepting the latter, are within a block of the proposed building—for the purpose of allowing the inmates therein to communicate directly with Mr. Taber, and make appointments for a sitting, etc. This alone will be a novelty and convenience to the ladies, who can arrange their toilets at their respective hotels, and secure a picture without being compelled to wait any length of time at the gallery. Mr. Taber is now having made in this city instruments for taking pictures by electricity. These, in connection with Mr. Taber's great skill, taste and courteous deportment, combined with the location and appointments of his gallery, are sure to make it the most attractive institution of the kind in the city. The building will be ready for occupancy about the 1st of July. In the meantime Mr. Taber contemplates a trip East and to Europe for the purpose of securing an entire new outfit for his business, comprising all the latest and most improved instruments that can be obtained. It is contemplated that \$15,000 will be expended in fitting up this establishment. We believe that Mr. Taber is the only photographer in California that contemplates competing with the European galleries at the coming Paris Exposition. Mr. Taber has introduced on this coast many new and beautiful ideas in the photographic line, of which we remember the "Promenade," Pictorials, Chromatics, Spherical, Statuette, Rustic, Marine, Equestrian, etc.; and his success in securing satisfactory pictures of children cannot be disputed. The rooms will be so arranged that several can be thrown into one for large pictures in groups, for the taking of which Mr. Taber is justly noted.

We can speak personally in favor of the excellencies and perfections of Mr. Taber's photography. He has invented and patented more improvements than any other photographer on this coast during the past ten years.

Woodward's Gardens were never more attractive than at present. A fine lion and two lionesses, all young and not fully grown, have just been added. Balloon ascensions by Prof. Martin are now being made. The popularity of the gardens continues to increase. Rates of admission unchanged.

ANY person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

MR. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

AYER & SON'S MANUAL contains information of much value to advertisers; sent free. Address N. W. Ayer & Son, Advertising Agents, Times' Building, Philadelphia.

ANY PHOTOGRAPHER having a large Camera Box for sale will please notify "N. S." at this office.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 commercial St., San Francisco, (fourth floor).

vorable rates. Send stamp for our circular and samples.

To Mining Secretaries.

An amendment to Section 336 of the California Code,
taking effect July 1st, 1874, provides that in addition
to the regular publication, daily or weekly, of the assess-
ment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation
from the law:

"The notice must be personally served upon each
stockholder, or in lieu of personal service, must be set
through the mail, addressed to each stockholder at his
place of residence, if known, and if not known, at the
place where he principal office of the Corporation is sit-
uated."

The above refers to the ASSESSMENT NOTICE only.
Advertisers in the MINING AND SCIENTIFIC PRESS
will be furnished with copies of assessment notices printed
on slips suitable for serving personal notice under this
law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated share
will do well to recommend the publication
of the official notices of their companies
in this paper, as the cheapest appropriate
medium for the same.

California Fruit Growing Association.—
Principal place of business, San Francisco. Location of
property, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of
Directors, held on the third day of May, 1878, an assessment
(No. 3), of three (\$3) dollars per share was levied upon the
capital stock of the corporation, payable immediately in U.
S. gold coin, to the Secretary, at the office of the Com-
pany, 641 Sacramento Street, San Francisco, Cal.
Any stock upon which this assessment shall remain unpaid
on the eighth day of June, 1878, will be delinquent
and advertised for sale at public auction, and unless pay-
ment is made before, will be sold on Saturday, the twenty-
ninth day of June, 1878, to pay the delinquent assessment,
together with costs of advertising and expenses of sale.

D. A. BROWN, Secy.
Office, 641 Sacramento Street, San Francisco, Cal.

Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco,
Cal. Location of works, Cherokee Flat, Butte County, Cal.
Notice is hereby given, that at a meeting of the Board of
Directors, held on the seventh (7) day of April, A. D.,
1878, an assessment, No. 33, of five cents per share was levied
upon the capital stock of the corporation, payable immedi-
ately in United States Gold coin, to the Secretary, at the
office of the Company, Room 6, No. 318 Pine Street, San
Francisco, Cal.

Any stock upon which this assessment shall remain unpaid
on the twenty-seventh (27) day of May, A. D., 1878, will be
delinquent, and advertised for sale at public auction, and
unless payment is made before, will be sold on Tuesday, the
eighteenth (18) day of June, A. D., 1878, to pay the delin-
quent assessment, together with costs of advertising and ex-
penses of sale. By order of the Board of Directors.

J. W. CLARK, Secy.
Office, Room 6, No. 318 Pine St., San Francisco, Cal.

Excelsior Silver Mining Company.—Lo-

cation of principal place of business, San Francisco, Cal-
ifornia. Location of works, Potosi District, Lincoln
County, Nevada.

Notice is hereby given, that at a meeting of the Board of
Directors, held on the twelfth day of April, 1878, an as-
sessment of twenty-five cents per share was levied upon the
capital stock of the corporation, payable immediately in U.
S. gold and silver coin, to the Secretary, at the office of the
Company, 304 Post Street, San Francisco, California.

Any stock upon which this assessment shall remain un-
paid on the twenty-third day of May, 1878, will be delinquent
and advertised for sale at public auction, and unless pay-
ment is made before, will be sold on Monday, the tenth day
of June, 1878, to pay the delinquent assessment, together
with costs of advertising and expenses of sale.

FRANCIS P. DEVINE, Secy.
Office, 304 Post Street, San Francisco, California.

S. M. Mining Company.—Location of

principal place of business, San Francisco, California.
Location of works, Mineral Point Mining District, Plumas
County, California.

Notice is hereby given, that at a meeting of the Board of
Directors, held on the third day of May, A. D.,
1878, an assessment (No. 3), of five cents per share was
levied upon the capital stock of the corporation, payable
immediately in United States gold coin, to the Secretary,
at the office of said Company, Room 6, No. 318 Pine Street,
San Francisco, California.

Any stock upon which this assessment shall remain unpaid
on the eighteenth day of June, A. D., 1878, will be delinquent,
and advertised for sale at public auction, and unless payment is
made before, will be sold on the Monday, fifteenth day
of July, A. D., 1878, to pay the delinquent assessment, to-
gether with costs of advertising and expenses of sale. By order
of the Board of Directors.

The Mining & Scientific Press,

Is the leading mining journal in America, and it enjoys a
large circulation among the more intelligent operators
and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific
Coast it is decidedly popular, and is a standard journal
with the most thrifty industrial people of the Pacific
States and Territories. Its authority is of the highest
order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist,
mining operator and intelligent mechanic and manufac-
turer will find profit by its reading.

Subscription, postage prepaid, \$4 a year in advance.
Sample copies, post paid, ten cents.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degree to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity. It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. STEINWAY

PIANOS TO EUROPE.

STEINWAY & SONS Orders From Europe

Have increased to an extent, necessitating the establishment of Warerooms in London, England, and connected with it is a Concert Hall, the whole combined making the most elegant Piano Warerooms in Europe, and stands there as a monument of American genius and industry.

It is impossible to mention in the limited space of an advertisement the innumerable triumphs of this energetic firm. They stand foremost as inventors in Piano building in America, and in that respect, no small compliment to their inventions is the undeniable endorsement of all their competitors, as shown in their imitative efforts. Certain principles of the Steinways, are, however, so completely protected, that no imitation or substitute is attempted at all, and the shallow method of crying such inventions down are resorted to and relied upon.

The Steinways designed and perfected the Overstrung and Iron Frame systems. The application of the Agraffe Arrangements to Square and Upright Pianos. The Patent Duplex Scale, creating the most beautiful treble tones, (the Duplex Scale is of recent invention and only to be found in Pianos sold recently). The improved Double Dampers. The later idea extending the Agraffes to every string in the Piano. The highest finish to all parts of the instrument, including first quality of ivory, ebony, felt, cloth, etc. The wood and varnish of such first-class character, that the employment of large capital and experience alone permits.

The name of Steinway has become a "household word" in American homes, and the satisfactory record of 18 years' trial on the Pacific Coast, in itself assures the purchaser that the investment is no speculation, but one of perfect security.

The oft-repeated story of rival makers claiming to have been Steinways' foreman, etc.,

should have no weight with purchasers. An immense manufacturing business like the Steinway is divided into departments for the various classes of work, and a foreman of one department superintends that alone, and cannot be perfected in other details.

The Steinways (a numerous family) are the inventors and designers of the principles of their pianos, and are alone responsible for the thorough execution of their own ideas.

In the Machinery Department at the late Centennial Exhibition, Steinways were awarded a special medal for an invention for testing their iron frames under a pressure of 5,000 pounds to the square centimeter. (This award was distinct from their medal for the best pianos exhibited.) The iron frames in Steinway pianos are the only ones so tested, and while other makers rely on castings from an ordinary foundry, the Steinways maintain their own foundry, and manufacture a frame of composite metal, which adds greatly to the resonant qualities of the instrument in general.

It often occurs that the attempt is made to raise the character of pianos constructed on less costly principles to the rank that the Steinway maintains, by naming a price, the same, or nearly so. This method is frequently exposed by the perfect willingness of the dealer to make astonishing discounts for cash, or extremely long credits; systems not entertained in any first-class business. In selling a Steinway piano, a guarantee of worth is given protecting the purchaser for five years, and catalogues issued by the Pacific Coast Agencies have a uniform rate of prices in gold, and where desired a liberal installment plan is offered to responsible buyers, with an additional charge of simple interest on deferred payments. Catalogue mailed on application to

M. GRAY, GENERAL AGENT,

The Pictet System for Manufacturing Artificial Ice.

The general use of ice for domestic, manufacturing and other purposes, dates from the early part of the present century; the immense extent to which this trade has grown, is well illustrated by the average consumption of New York and Brooklyn, which is about 300,000 tons per year, the yearly increase being estimated at about 70,000 tons. This increase is not so much

although just there, it would be of so much more use and benefit.

These difficulties have caused numerous inventors to turn their attention towards the manufacture of ice by artificial means, and a great many different machines have been brought out. The making of ice by freezing mixtures has long been known, and has found extensive application in the laboratory, and used also for freezing ice-cream, etc. These mixtures are formed of certain bodies, whose chemical combination produces cold; such as salt and pounded ice or snow, nitrate or muri-

What intense cold can be thus produced, is well illustrated by the familiar experiment of freezing water or mercury in a red-hot crucible; which is effected by the expansion of liquified sulphurous acid, or of solidified carbonic acid, over which ether has been poured. These substances, in evaporating, absorb heat so rapidly that even the red-hot crucible cannot supply it quickly enough, (especially as it is separated from the substances by their vapor, which is a bad conductor), and thus the heat of the water or mercury is absorbed, causing them to freeze. The volatile liquids now mostly used in ice ma-

escapes through joints, but even penetrates cast-iron three-fourths of an inch thick; the solution has thus to be constantly renewed, which is rather expensive. The danger of explosion also increases with the pressure, and accidents from this cause have often occurred. Another source of danger is the deposit in the boiler over the fire, causing the plates to burn, and finally leading to explosion, if not constantly watched. The ammonia machine needs a great many vessels, and an innumerable amount of pipes, coils, valves, etc., making it altogether a very costly and complicated affair.

MACHINERY FOR THE MANUFACTURE OF ARTIFICIAL ICE BY THE PICTET SYSTEM

due to domestic consumption as to the requirements of manufacture, etc. Brewers, soap and candle factories, etc., use immense quantities, and the transport of meat and fruit over long distances, that has recently been inaugurated, has created an additional demand. In gathering natural ice for commerce, there are not only great expenses in cutting and storing it, erecting immense ice-houses, specially constructed for the purpose, and transporting it by rail or water to its place of consumption, etc.; but a great amount of waste takes place, which, even for a moderate climate like New York, is estimated at one-third of a crop. In Southern countries this waste is of course vastly increased, and this added to the greater cost of transportation, makes it an expensive luxury,

ate of ammonia with water, nitrate of potassium, etc.

Elastic liquids, when compressed, are highly heated, and if they are then cooled to their former temperature, and permitted to expand, the amount of cold produced by rarefaction will be equal to the amount of heat generated by compression. On this principle ice machines are worked by compressed air, but as they have not been a success to any extent, it is hardly necessary to say anything more about them. The most effective way to obtain a great amount of cold, is by the rapid expansion of a liquified gas when the pressure is removed from it, or the evaporation of a highly volatile liquid, especially when mechanical means are used to hasten the volatilization.

chines are ammonia, sulphuric ether and sulphurous acid. Ammonia was first applied by Mr. Carre, who introduced a saturated solution of ammonia into a boiler, volatilizing it under strong pressure, by heating it to 284°-302° Fahr. The vapor flows into a tubular condenser, washed by a current of water, which carries off the heat when the vapor is liquified by pressure. The liquid ammonia flows into the refrigerator, where it evaporates, producing intense cold; it is then conducted back to a vessel where it is absorbed by water, and again goes through the same process. To liquify the ammonia, a pressure must be employed corresponding to the tension of the vapor at the temperature of the condenser.

Under such great tensions, the gas not only

Somewhat simpler are the machines using sulphuric ether, which have lately come into prominence in England. The ether evaporates in a tubular refrigerator, imparting cold to an uncoagulable liquid (brine) which circulates around and through it. This liquid is then introduced into a tank containing a great number of boxes, and freezes the water in the latter. The ether vapor is drawn up by a pump, which compresses it into a condenser, where its heat is abstracted by water circulating around it and through its tubes. The ether liquified by combination of pressure and cooling, is then led by a small pipe back to the refrigerator, evaporates again, and is thus used over and over.

Continued on Page 326.

A Forward Step in Astronomy.

[A Paper by PROF. GEO. DAVIDSON, read before the California Academy of Sciences.]

There has been a recent movement to change the location of the U. S. Naval Observatory, at Washington, to one more favorable to the health of observers, and also for obtaining better conditions for observing.

It is doubtful if 20 hours of good seeing with the 26-inch refractor and moderate power can be had per annum; for the first year a power of only 600 could be fairly used upon a few occasions.

This recent movement has therefore prompted astronomers to discuss the proposition on broad grounds, so as to utilize the instruments already constructed. Admiral Rogers, Superintendent of the U. S. Naval Observatory, has expressed his convictions upon the subject, and in reply to his inquiries we condense the expressions of astronomers accompanying his letter in Misc. Doc., No. 25, Senate, 45th Congress, second session.

Prof. Hall says that the testimony of all astronomers who have really made observations at altitudes of 5,000 or 6,000 feet uniformly favor elevated positions for astronomical work.

He shows the relative practical gain in brightness of celestial objects, and says that should there be a corresponding gain in the steadiness of the images the advantages of an elevated position for astronomical observations of faint objects like nebulae, and for the work of stellar astronomy, would be very great. And he concludes by expressing his opinion that by establishing a telescope on the lofty plains of the West we have a simple and easy means of making a forward step in practical astronomy.

We have no doubt that had Prof. Hall been posted with his telescope where it was originally intended to locate the Lick Observatory, that he would have observed the satellites of Mars with much greater precision and certainty; or that a telescope of from six to eight inches objective, so located, would have seen them.

Prof. Harkness says that the question whether extreme steadiness and purity of atmosphere can be best obtained on an elevated plateau, is yet open, but that, if the advantages should be proved, then it may be well to have the serious disadvantages of location far from a large city, etc.

Even granting these disadvantages he does not think the work should be for precision especially, but for studying the physical characteristics of the celestial orbs.

Prof. Eastman says the desirability of placing observations on high elevations is still a mooted point, and that the increasing interest in astronomical research at the present time seems to demand that some steps should be taken to solve the problem. He asserts that a thoroughly equipped observatory, competent to undertake and to continue the necessary routine work of such an institution, cannot be successfully established and maintained except in close proximity to a large city, etc. If, however, an elevated and suitable site can be obtained west of the Mississippi, where the peculiarities of the climate and the purity of the atmosphere materially increases the penetrating or defining power of the telescope it would be very desirable to establish there, one large telescope for research and discovery, leaving the routine work to the older and complete observatories. He suggests the equipment of parties in localities to test the question in the transit of Mercury, May 6th, and total solar eclipse of July 29th.

Prof. Holden says that his remarks are based upon his experience, and upon the following published reports of experiments undertaken for the object in view:

C. P. Smythe, Tenerife—An astronomer's experiment. London, 1858.

C. A. Young—Report on astronomical observations at Sherman, Wyoming. Appendix No. 8, U. S. Coast Survey Report, 1872.

George Davidson—Astronomical observations in the Sierra Nevada. Appendix No. 9, U. S. Coast Survey Report, 1872.

Henry Draper—Astronomical observations on the atmosphere of the Rocky mountains. *American Journal of Science*, Vol. XIII, page 89. He says that "all the above mentioned reports testify to the extraordinary transparency of the atmosphere at great altitudes," and mentions his own favorable experience in 1873 at an altitude of 9,600 feet. He also says that the general testimony of those who have observed at these high stations report that this great clearness is accompanied with great steadiness of the stars, although occasionally both conditions are favorable. His conclusions are that for regular and continuous work, a site near the present Naval Observatory can be chosen for all necessary work, but for special investigations a branch observatory having a new 26-inch refractor should be established at some elevated station.

Several points are worthy of particular note in this recent movement; not however new to the members of the California Academy of Sciences, but important enough for repetition.

First, That great elevations are better for astronomical researches than lower ones, when the stations combine favorable physical and

meteorological conditions. These conditions have been shown in that communication to the Academy, announcing the endowment of the Lick observatory, to exist in California; and confirmed in the report upon observations in the Sierra Nevada.

Second. That the stations selected for such work should not be upon great plateaus; on the contrary, they should be upon elevated, isolated peaks, or upon well-marked and pronounced mountain ridges, such as the Sierra Nevada or San Bernardino, and that the elevation should be not less than 8,000 to 10,000 feet above the sea. This is a point upon which the professors quoted are in error. They always refer to elevated plateaus and never to isolated peaks or chains.

Third. The climatic conditions must be favorable; the mountain chain must have prevailing clear weather; such cloudy conditions as exist on the greater part of the Andes in South America would be totally unfit for the observations proposed. Long continued periods of stormy winds would be considered a very unfavorable condition. Locations where the surrounding atmospheric conditions are different would be unfavorable, such as a station on the border of a lake where the atmosphere would be largely charged with aqueous vapor over the lake, whilst the atmosphere over the adjacent land would naturally be comparatively dry; yet variable winds would complicate the conditions. Such locations as Mt. Diablo and Mt. Hamilton are also extremely unfavorable, because the atmosphere to the westward is laden with aqueous vapor from the summer fogs, whilst the dry air of the San Joaquin valley keeps back these fogs as if a solid physical barrier was interposed. Moreover, the evidence of the wind-torn bushes weighs against the adaptability of such locations.

Fourth. The authorities quoted do not report great unsteadiness of the stars with the great transparency of the atmosphere. On the contrary, the steadiness of the images of the stars, planets, sun and moon are especially noted in Davidson's reports to the Academy and to the Superintendent of the Coast Survey. Moreover, this is the logical sequence of the conditions which constitute unsteadiness. Were the atmosphere at the surface of the sea twice as dense as it is and were the aqueous vapor capacity twice as great as now exists, the result would be vastly increased unsteadiness of the atmosphere; the eye would see twice the aerial disturbance that it now sees over a wheat field in a hot summer day and telescopes could not use advantageously half the power they use at present.

So if we ascend to a height of 10,000 feet, where the atmosphere is only two-thirds of the pressure at the sea level, the atmosphere loses its capacity for carrying aqueous vapor and for consequent disturbance of the atmosphere. Higher powers may therefore be used with the telescope, which has also acquired greater space-penetrating power on account of the tenuity of the atmosphere.

Fifth. If an honest movement is to be made in astronomical research, those who undertake it must make some personal sacrifices in the cause. The opinions quoted indicate a love for the comforts of a great city wholly incompatible with the devotee who searches for truth for truth's sake. It is true that questions of salary must be considered, but the enthusiasm and zeal that project and carry out such researches look more to unfolding new discoveries than the devising of absolute personal comfort. For work of the character indicated in this new era, we need men who will have the disadvantages of comparative isolation for the greater glory of advancing the higher knowledge demanded by the mental activity of the nineteenth century.

Sixth. Years since it was proposed to this Academy that the proper mode for determining the best location for an astronomical observatory was actual experiment and comparison of several stations fairly indicated by given favorable conditions. The professors quoted adopt the same view and indicate the phenomena of May 6th and July 29th as tests. But the deduction from the observations of a few hours might be wholly illusive and delusive. The series of observations for such a purpose must extend through at least a year, involving the various climatic conditions of the seasons. Less than that will hardly be accounted satisfactory.

In conclusion, this Academy can well lay claim to having been among the first, if not the first in the field, for the location of astronomical observations at great elevations for the purposes of research and discovery. And it naturally continues its interest in a subject that now promises to lead to great, although but partial advantages.

SULPHUR AND QUICKSILVER.—They have now at work, says the *Healdsburg Enterprise*, from 10 to 15 men on the sulphur and quicksilver mine near the Geysers. About two tons of sulphur, worth, in San Francisco, \$50 per ton, are taken out daily. They employ here an original and superior process for the reduction of the crude sulphur, which produces an article that commands the highest price in the market. The sulphur is packed in boxes of 175 pounds each and they now have ready for shipment over 40 tons. They also have a large accumulation of quicksilver ore on the dumps and will at once commence to haul material to the mine for the construction of a 10-ton furnace to reduce the ore. The mine will pay to work for the mercury, although it is estimated that there is \$40,000 worth of sulphur in sight.

Doing and Over-doing.

If we write nothing new let the excuse be that the words are true. The time is just upon us when the farmer is most apt to overstep the boundary between doing and over-doing. The harvest labor, heavy in its gifts, is apt to be as well heavy in its drain upon the vital force both in brain and muscle. The mind is charged with excitement. It is working at its highest speed. It is off its guard. It puts the whip and spur to physical power and endurance until they too are acting at their utmost tension. Our harvest operations are in many cases carried on upon so large a scale that he who commands the field has enough on his mind and hands to keep half a dozen men well employed. And yet, as a general thing, the work either does not admit of division, or there are no fit ones to share it and the grain grower must assume the whole task, with its great responsibilities and its thousand details, and conquer, or he conquered by it.

Although there is but a step between doing and over-doing, it is a step which can only be taken at the cost of months of discomfort, or, sometimes, at the price of a life's strength and health. If the hurried, worried man could or would but stop to think of the small ratio which exists between getting the work sharply and successfully prosecuted and preserving his own mental and physical power, he would be safe. The rule is not to do this. In most instances there is but a single thought upon the mind, and that is the quickest route to the accomplishment of the task. Thus the man is driven before the wind of determination, and, like a ship without a rudder, his strength, robbed of the guidance of its mental guardian, rushes wildly on its course, with nothing to turn it from lurking dangers.

In the hope that, speaking thus early, we may gain possession of minds which soon will pass beyond the reach of editorial preaching, we are led to mention a few points which are generally regarded as foundation stones in the structure of well accomplished tasks. First, we would note that, generally, it is not work which weakens the frame and unseats the mind. Rather it is anxiety and its fretful handmaid worry, which as a bad associate of work, misleads it and hazards its success. Calm, and yet sprightly and vigorous, effort does not injure a man, but is rather salutary in its effect. The mind gains strength, the muscles grow, under such exercise. The appetite is sharpened and sleep is promoted by healthful exertion. Diametrically opposite is the effect of anxious, nervous effort. A man's strength is lashed by it until it undertakes the impossible, and it falls back weakened if not broken. The mind is spurred into a tremulous excitement which robs it of its power. Appetite departs. Sleep becomes a mockery; and the tossing victim yearns for the faintest light which shall return him to the labor of the day which wears him even less than the dreams of the night. Such is the contrast between the two conditions of doing and over-doing. It may be seen in all occupations of men which call for supreme effort. The way to secure a condition of effective doing, with certain limitations of natural disposition and temperament, is to begin with the determination that no matter how great the emergency which may arise, a man shall calmly master it and not be mastered by it. Resolve beforehand to be the victor, not the victim. Let everyone to whom the coming weeks shall bring manual labors decide now that he shall rule his own mind and strength, and no contingency shall be too difficult or vexing for his triumph over it.

In addition to storage of will to meet the duty of the days, there is also a matter of daily regime to be observed. This is regularity of habit. It is, we believe, the general dictum of both science and experience, that the way to meet unusual labors is not by artificial stimulants which are transitory in their effects, but by reliance on natural agents, which are more lasting. Therefore let the taking of sufficient and nutritious food be a matter of religious regularity. Do not alternate between a famished and a surfeited condition, for weakness is sure to follow. Above all be as regular as possible in wooing "nature's sweet restorer," sleep. He who eats well and sleeps well, arises each morning a tower of mental and physical strength, and he who endangers his hold upon these recruiting agencies, renders himself liable to all the ails and weaknesses which we have named and more besides.

We have spoken especially of the rules of strength and weakness as relating to the lord of the manor, but they apply with certain relevance to its mistress. Harvest hurry is apt to unsettle the whole household. Upon the housewife fall unusually heavy burdens and cares. She too must be "mistress of herself though China fall." She must not worry herself with too much serving. She must have no midnight tasks of preparation, nor midnight dreams of runaway servants and laborers clamorous for their rations. Let her too prepare for whatever extra cares the days may bring, by the cultivation of a quiet determination to let no trouble rattle the serenity of her disposition, nor disturb the even balance of her thought. It is doubtless true that in this State our farmers' wives are somewhat less burdened with harvest pro-

viding and lodging than their Eastern sisters, and yet the tumult in the field is sure to invade the quiet of the home unless its mistress meet it at the threshold, with the tranquility of her disposition and the firmness of her resolve. Let but the wife with her gentle influence and peculiar tact undertake to rule the troubled harvest host from her quiet throne in the home, and she can often rescue her lord from the consequences of a thoughtless over-doing, and thus ensure a glad and successful harvest home.—*Rural Press*.

Mines that have Never been Found.

In almost every mining town and camp of the Golden State the old settlers tell of places where streams, and gulches and ravines were immensely richer in placer gold up to a certain point, when they suddenly ceased to pay. Somewhere in the neighborhood, doubtless lies the channel whence came the gold found below, but no man has ever been able to hit upon it—is one of the mines that have never been found. Sometimes, on a flat or in a sag on the side of a hill or mountain, the placer miner has unexpectedly found great quantities of bright quartz gold, or fragments of quartz rich in gold. In vain he searches for the lode from which came the gold and the quartz; it remains one of the mines that have never been found. In places not only fragments, but also great blocks and howlders of quartz filled with gold are found, and for a time diligent search is made for the place whence it came; but, one after another the prospectors became discouraged, and, finally, the source of the gold is set down among the mines that have never been found. We might furnish a list of not a few such places as are spoken of above, but shall leave a particular account of them to be given by the man who shall, one of these days, write the history of the mines that have never been found. Such a history would make quite a thick pamphlet, would include many interesting and romantic stories, and would be an incentive to prospecting and mining in many now almost deserted camps, provided some pains are taken to get at the facts in all cases. In California there is, doubtless, to-day more gold in the mines that have never been found than remains in all those that are known and worked.—*Territorial Enterprise*.

THE PUMPING MACHINERY FOR THE NEW YELLOW JACKET SHAFT.—Good progress is being made in getting the immense pumping gear of the Yellow Jacket mine at Gold Hill in place. This ponderous machinery, the heaviest ever constructed on this coast, and which was minutely described in the *PRESS*, March 2d, weighs, that on the surface and that in the shaft being included, over 700 tons. The sole plate of the high pumping engine is in place and weighs 102,720 pounds. It is 64 feet in length and is in seven sections. A few days ago they took into the building the shaft and cranks, which weigh 50,600 pounds. The weight of the surface bob is over 85 tons. These will be the heaviest pumping works on the Comstock, and as yet they have no water except that which comes out with the dirt. This heavy pumping machinery shows that the management purpose putting the shaft down to a great depth and that they intend to be so well prepared that they will not be stopped by any amount of water that may be tapped.

LOCOMOTIVE PERFORMANCES.—Several correspondents have favored the *Railway Age* with instances of remarkable locomotive performances, drawn out by the assertion of the president of a railway in India, that the average of 1,250 miles per month for six months, made by his engines, was probably unequaled in any country. First we had the item that an engine on the Atlantic & Great Western road made 3,681 miles in a month. Then the Cleveland, Tuscarawas Valley & Wheeling reported an engine making 51,395 miles in a year, and as high as 5,640 miles in a month. The Lake Shore & Michigan Southern followed with a record of 45,000 in nine months averaging 5,000 per month, and in one month reaching 7,007 miles. Manager Hood of the Western Maryland, now gives some exceedingly interesting statements showing the performances of several of his engines, one of which made the extraordinary record of 59,953 miles in twelve months, at the remarkably low cost for repairs of one and one half cents per mile run. Thus far the Western Maryland has the palm on annual work by a single engine.

GOLD MINING IN GEORGIA.—Professor Little the Georgia State geologist, states that "there are now 26 active gold mines in Georgia that are now being worked properly and systematically. There are in these about 260 stamps. The average yield per stamp is \$100 per month. This would give us a yield of \$25,000 per month, or \$300,000 per year. But the number of stamps at work is continually increasing. I know of a purchase being made that will put a new mine to yielding at once. And take Porter & Meakin's factory; there are now there, in process of completion, one 20-stamp mill, one 10-stamp mill, and some smaller mills, or 50 stamps in all. These will increase the yield \$5,000 per month, or \$60,000 per annum. I should not be surprised if, by the 30th of June next, we should have mills in sight that would produce near a half million a year, or over treble the production of the previous year."

MECHANICAL PROGRESS.

Points on Rotary Cutters.

Prof. Sweet, of Cornell University Mechanical School, gives the *Polytechnic Review*, some notes on milling machines, in which he speaks of rotary cutters. He says a rotary cutter has its advantages and disadvantages. As a simple cutting tool it is costly to make and keep in order; and for doing plain work that can be done in the lathe or sharpening machine its economy is doubtful. But the cutter, when made, possesses a number of cutting edges which will do a large amount of work before they get dull, and which are hence, especially fitted for producing irregular forms. There is a great diversity of practice in regard to the number of teeth in the cutters, which must be of necessity partially owing to the size and kind of materials operated upon, and mainly because of the difference in the stability of the machines. If the machine is frail and the work light, a five tooth cutter is necessary. If the machine is absolutely rigid and the work firm, then a cutter of either few or many teeth can be used.

It is desirable to use a coarse-toothed cutter when possible; first, because it can be sharpened without drawing the temper; and, second, because every cutting edge can then be made to cut and so work faster. When there are too many cutting edges, a part of them are sure to slide over without cutting, thus dulling and burning down the metal, making it all the harder for the following cutting edge. In work of an irregular form, but not such as requires absolute size (such as the grooves in a tap or a reamer), the cutter can be ground by hand on an emery wheel or a dry grindstone, without any other requirement than experience; but for work requiring absolute accuracy, the cutter should be formed like Brown & Sharpe's cutters for cutting tooth wheels, so that they can be sharpened by grinding the face, without changing the form. Many times in the making of cutters for a single job, or for a special job where there is but little to do, much time and money are uselessly wasted by making the cutter as complete as would be possible for a standard tool. Often a four, three, two, or even a one tooth cutter can be made and the job finished in less time than it would take to make a complete circular mill. Tempering cutters, so as to maintain their truth, is not a job that every smith can do; and with a cutter of one to four teeth, each tooth can be tempered separately, and the danger from springing avoided. A two or more tooth cutter sprung in tempering is sure to cut wider than itself, but a single tooth cannot. Cutters made to cut upon their end exclusively should have but few teeth; two, three, or four are likely to give better satisfaction than more.

A NOVEL METHOD OF INLAYING WOOD.—The following is an interesting process recently patented in England: A veneer of the same wood as that of which the design to be inlaid consists—say sycamore—is glued entirely over the whole surface of any hard wood, such as black walnut, and allowed to dry thoroughly. The design is then cut out of a zinc plate, about 1-20th of an inch in thickness, and placed upon the veneer. The whole is now subjected to the action of steam, and made to travel between four cast-iron rollers of eight inches diameter by two feet long, two above and two below, which may be brought within any distance of each other by means of screws. The enormous pressure to which the zinc plate is subjected forces it completely into the veneer, and the veneer into the solid wood beneath it, while the zinc curls up out of the matrix it has thus formed, and comes away easily. All that now remains to be done is to plane down the veneer left untouched by the zinc until a thin shaving is taken of the portion forced into the walnut, when, the surface being perfectly smooth, the operation will be complete. It might be supposed that the result of this forcible compression of the two woods would leave a jagged edge; but this is not the case, the joint being so singularly perfect as to be unappreciable to the touch; indeed, the inlaid wood fits more accurately than by the process of fitting, matching and filling-up with glue, as practiced in the ordinary mode of inlaying.

CAR LIGHTING.—Those who have passed miserable hours in the sepulchral light of railway cars will be glad to know that Mr. Webster Wagner has devoted much time to investigating the best method of lighting railroad cars, and has hit upon a discovery which is thus described: "The lamp has a shape not unlike that of a telescope. The larger end, at the bottom, causes a fan to oscillate, and this in turn gently forces the lard oil from the reservoir in the upper joint, saturating the wick, and making a light of surpassing brilliancy, steadiness and strength. The apparatus is wound every ten hours. No chimneys are required, and this saves much time, expense and annoyance. The light has a power equivalent to 13 candles. These lamps are furnished to each car, and a person is enabled to read the smallest print without the slightest difficulty. As soon as possible all the Wagner sleeping cars will be equipped with them."

A GREAT AMERICAN GUN.—The Ordnance Department of the Army has constructed a large rifled gun, weighing about 90,000 pounds, with a caliber of 12.25 inches, which is now undergoing proof at the Sandy Hook proving ground, under the direction and supervision of the Ordnance Board. So far the limited firings have developed the most satisfactory results. The gun is of cast-iron, lined with a coiled wrought-iron tube, with a length of bore of 227 inches, and is mounted on a carriage of late design, with all the modern improvements to control recoil and to facilitate loading and maneuvering. Although as yet the firings have been limited, still enough is known of the power of the gun to say that for use against ironclads it is equal, if not superior, to any gun of the same caliber in any service. The essential features which contribute to any superiority over others in this respect are length of bore, character of projectile and powder. In the foreign services the English 12-inch wrought-iron gun has a length of bore of 198 inches; the Krupp caliber, 12,008, has 222.5 inches; the Italian, 12.6, has 252 inches, while the American is 227 inches long. This length adopted by the Ordnance Department gives all the usual effects that can be obtained from this source, and secures a thorough consumption of the maximum powder charges, as has been practically proved by the absence of any unconsumed grains of powder after the discharge.

A MONSTER LOCOMOTIVE.—A monster locomotive, says the *Car Builder*, is in process of building at the Springfield shops of the Boston & Albany road. Its weight will be about 40 tons. The boiler is 10 inches longer than the standard, with 173 flues—11 above the ordinary number, and 4½ inches longer—12 feet three inches long, and two inches in diameter. Of the inside fire-box the side sheets are 60 by 60 inches, and the flue and door and crown sheets 60 by 42 inches. The total area of heating surface is thus 455 17-24 square feet, not considering the forward flue sheet. The cylinders, with 8 by 1½ inch ports, are 18½ by 28 inches, the largest heretofore being 18 by 26, and the two pairs of drivers are 4½ feet in diameter, which will bring the keys in the crank pin straps within about four inches of the dirt. The frame is straight, and 4 by 3½ inches, the standard being 3 by 3½, and six inches longer than usual. The "slab" part of the frame is in a single piece, "slotted" out in the center, so that the double slab form is retained with the advantage of being naturally united at the ends, which are riveted to the "jaws." The yokes, through which the crank rods play, are to be of one piece, instead of independent of each other as heretofore. Then side plates will be placed inside the drivers to make life secure in the cab in case of breaking tires.

OUR MACHINERY SHOW AT PARIS.—Edward King, writing to the *Boston Journal*, says: Our display of machinery is well chosen, but when we remember that the galleries devoted to machinery on each side of these colossal buildings on the Champ de Mars are considerably longer than Machinery Hall and the Main Building at Philadelphia put together, and that we occupy only an insignificant space—small by comparison with countries like Austria or Russia, countries which cannot supply one-tenth of the inventive ability possessed by the United States, it is a keen cause for regret. Our delay, our wretched, inexcusable delay, was the reason for this little and meager exhibit of our chief talent. We were compelled by a government who did not comprehend the importance of the exhibition to postpone everything until the very last minute, and the result will certainly be humiliating. The department of Italy—not far from ours—is to be regal in its splendor, and extends over two or three times as much space as ours. It certainly was a mistake to allow ourselves to be distanced by any country. We should have been greedy, and taken every particle of space that we could get by applying at an early day.

DANGEROUS BOILERS.—The *American Machinist* says: Since competition in boiler-making has brought down prices of first-class work where there is very little margin for profit, a great deal of poor material has been used in boilers in order to save a small percentage of the cost of safe and reliable material. Plates intended for marine boilers are required by law to be stamped with the tensile strength the iron or steel will stand; but plates for stationary boilers may be weak and unreliable, yet the government does not interfere to prevent their use. A rigid inspection law, applying to land as well as marine boiler material, would considerably lessen the danger incurred in the use of steam, if properly enforced. Some boiler-makers are criminally careless in the employment of material, well knowing it to be dangerous to place in a boiler, yet working it in so as to save a few dollars. We learn, on good authority, that several manufacturers of boilers have openly expressed themselves as utterly indifferent as to the strength or safety of the boilers they made, after they had been sold and the money obtained.

IRON BOLTS.—Iron bolts in wooden structures are always attacked by rust, which diminishes their size and loosens their hold. A simple remedy is now discovered. Bolt holes are coated with a mixture of zinc filings and grease. The iron is thus galvanized and preserved from oxidation. It is a French invention.

SCIENTIFIC PROGRESS.

Our Distance from the Sun.

At the late meeting of the National Academy of Sciences in Washington, there was an issue raised between English and American observations on the last transit of Venus and the resulting determination of our distance from the sun. California was represented in the discussion by Prof. Davidson. The victory would appear to be in favor of American observers. The subject was opened by an elaborate paper from Prof. C. H. F. Peters, of the Litchfield Observatory of Hamilton College. Prof. Peters began by giving a rapid review of the various values obtained for the solar parallax since Halley's method was put in practice; the defects and merits of these calculations were also briefly alluded to. The estimate obtained by Prof. Newcomb from a consideration of all the values from different methods was spoken of with approval; it gives the most probable figures as 8".848, with a plus or minus error of 0".013. (This is in miles, for the sun's mean distance, 92,381,000 miles, with the proviso that it may be as much as 92,517,000 or as little as 92,245,000.) Sir George B. Airy, the Astronomer Royal, has recently promulgated his results obtained from a study of the British telescope observations made at the last transit of Venus. He deduces a parallax of 8".76. This extraordinary result, which would carry us back toward estimates that have been largely discarded by astronomers, has excited general surprise. It is equivalent to a distance of 93,310,000 miles. In short, it may be properly stated that the British telescopic observations have really given us no new data for the parallax. They are not incompatible with previous estimates, but they prove nothing either way. Undue weight has been given by Prof. Airy to minor and very imperfect observations. Some curious instances were given. One of the observers had written to Prof. Peters: "We got nothing;" yet the indefinite notes were incorporated into Prof. Airy's calculations.

An exceedingly interesting discussion followed. Prof. Davidson pointed out other sources of error in the calculations of the Astronomer Royal. Prof. Newcomb said that an extraordinary fatality had attended all determinations of the parallax, and gave reasons for thinking that 8".88 might be the figure ultimately adopted. (This would make the distance 92,043,000 miles.) Prof. Young stated that he had just received information which he believed was entirely new in this country; that Mr. Stone, taking the same data that Prof. Airy had used, has arrived at a value of 8".88, precisely the same as Prof. Newcomb had just assigned. This announcement created a marked sensation among the academicians, and was followed by a round of applause.

THE INFLUENCE OF HEATING ON WHEAT.—Although the wheat produced in this State is so thoroughly dry that there is little danger of the heating experienced in other countries, it is of interest to note the results gained by French investigators as to the effect of the heat which moist new grain stored in bulk, evolves. When new wheat is placed in an open vessel or in heaps on the floor, a spontaneous heating will soon take place, and fermentation will begin; that kind of fermentation or chemical change which invariably precedes the sprouting of wheat. A vinous smell will be disengaged, and this smell will soon become acetic, and in a short time the wheat will be entirely spoiled and unfit for ordinary milling purposes. It is therefore clear that in most European climates it is impossible to keep new wheat either in hermetically close vessels or in heaps, with a constant access of air, before the water of vegetation or uncombined water which it contains has previously been expelled. The proportion of this water of vegetation must of necessity vary according to atmospheric conditions; it can, however, be determined pretty accurately, and Duhamel undertook some experiments on the subject, the result of which is on the whole satisfactory. Some two years' old wheat and some new wheat were submitted to the same treatment. They were first placed for a space of 24 hours in an oven heated to 47° 5 C., say about 10° above the temperature of the warmest summers. They both lost 1.32, or about 0.03125 of their weight. The temperature of the oven having been raised to 63° 3 C., a portion of the same two samples of wheat was left during another 24 hours, and their respective weights were lessened by 1.16, or 0.0625. These wheats were then sown in suitable ground. The new wheat germinated and grew well; the old wheat did not grow at all.

DEATH OF PROF. HENRY.—An item in last week's PRESS announced the death of Prof. Henry, of the Smithsonian Institute. The deceased has held the position of Secretary of this institution since 1846. He was a native of Albany, New York, and was in his eighty-second year. He early developed a genius for mathematics, and was in 1827 appointed Professor of Mathematics in the Albany Academy. In 1827 Prof. Henry began making experiments with electricity. It has been claimed for him that he was the first person to demonstrate the principles by which intelligence is conveyed through the agency of the telegraph. The deceased contributed several scientific papers to the *American Philosophical Transactions* and to the *Council of the Franklin Institute*.

The Ocean's Floor.

At a recent meeting of the Academy of Sciences in Washington, Prof. Alexander Agassiz read an essay descriptive of the results of the Blake expedition, with which he was connected. He has passed over, for purposes of sounding and survey, a distance of 1,800 miles in and adjoining the Gulf of Mexico. The work of observation was begun at the point where it had been left off by his predecessors in deep-sea dredging for that region—his father, Prof. Louis Agassiz, and Count Portales. They had, indeed, run one or two lines of dredging across the gulf, but it was done with the imperfect appliances of that day and brought no complete results. In depths exceeding 500 fathoms, for instance, Count Portales found little animal life, and at that time there was a general belief that the limit of existence had been nearly reached at such depths.

The following observations are reported by Prof. Agassiz: Where the depth is 1,800 to 2,000 fathoms inside the Windward islands, the fauna corresponds to that of the Atlantic outside, the animals having doubtless penetrated through the openings between the islands. All classes of the animal kingdom found in the ocean are well represented. Inside the Caribbean sea, the fauna is more specialized and characteristic. On the *Challenger* expedition it had been ascertained that the red clay ooze of the ocean bottom was largely a result of the decomposition of the shells of surface animals—a disintegrated portion of the limestone contained in those shells. Everywhere in the gulf a similar deposit was found. Pelagic animals, chiefly mollusks, may be said to fill this sea from the surface to eight, 10 or 25 fathoms in depth. There is no doubt that a stratum is forming at the bottom of the sea due entirely to the coverings and hard parts of pelagic animals which exist in swarms near the surface. On the question as to the existence of many animals in deep water, near neither the surface nor the bottom, Prof. Agassiz is inclined to distrust the *Challenger* observations. The apparatus there used could not furnish proof as to the point whether the animals were really caught at the depth of 1,000 fathoms or near the surface.

Prof. Agassiz is not yet prepared to throw additional light on the question of sight by pelagic animals at great depths. The fact remains that at these depths there are found creatures of two classes in respect to vision: one eyeless, or nearly so, and with curious changes of structure taking the place sometimes that the eyes should occupy; others in a totally opposite condition, having eyes enormously developed, as if to enable them to see with the smallest modicum of light. This is true at depths of 1,500 to 1,900 fathoms or more, both as to crustaceans and fishes. It seems strange that the same conditions should have produced diametrically opposite results. In the discussion which followed, Professors Cope and Gill both regarded the two lines of development of obliterated and increased vision in animals at great depths as a natural result of the evolution hypothesis; just, in fact, what we might expect.

Microscopic Examination of Bee Stings.

At a recent meeting of the New York Microscopical Society, Mr. J. D. Hyatt, President, gave an account of his investigations on the subject of stings. These studies have extended over a period of eight years, but only recently have some obscure points been made out. The general form of the stinging organs of the honey bee is well known by microscopists. It consists of a horny sheath, within which there are two stings, and these, when in use, are thrust out. There is a poison bag which discharges its contents into the sheath. This is a point well known, but it appears that the precise method by which the fluid makes its way from the sheath into the wound has not heretofore been properly explained. According to the generally accepted explanation, the poison is supposed to flow in a channel formed between the two piercers or stings and in this way makes its way into the wound. Mr. Hyatt advances another hypothesis and believes that he has positive proof that he is right, having dissected and examined upwards of 1,000 stings.

After long and patient investigation the explanation offered is as follows: At the back part of the sting these channels open into the sheath, and just in front of that opening, attached to the stings, is a sort of valve which projects into the sheath. When, in the operation of stinging, the piercers are thrust out, they carry forward this valve so as to close the front of the sheath, for which purpose they are admirably adapted, and the poison thus confined within the sheath makes its way out through these openings in the stings. When once understood the operation seems very simple. There are also some objections to the common explanation. Cross sections of the stings show that the walls are quite thin, but strengthened in certain places by internal deposits. The form of the stings is such that no channels can be formed between them to conduct the poison.

GARNET IN CORUNDUM.—Mr. J. C. Trautwine, C. E., says that he has found garnets imbedded in the corundum of Jackson county, North Carolina. The *Polytechnic* believes that this association of these minerals has never before been observed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

THE ADVANCE.—*Chronicle*, May 11: This company yesterday commenced taking out good ore from the north drift, on a contract to furnish Carter & Adams, agents of the Frue concentrators, 5,000 tons, to be worked at the company's mill, below Mt. Ballion, which is to be placed in running order as soon as possible and furnished with Frue concentrators.

THE DOUBLE STANDARD.—This mill has this week been running on high-grade ore. On Thursday a blast brought down ore which assays \$1,000 a ton.

AMADOR.

KEYSTONE.—*Ledger*, May 18: A small pocket of rich ore was struck in this mine on Wednesday. It embraced several tons, the whole of it speckled with gold. The rock was sent to the surface in sacks, it being too rich to be handled in the ordinary way.

MONTERICHARD.—The mill was cleaned up Saturday, yielding 12 pounds of bullion. This result, though nothing to boast of, equaled the anticipations of the managers for the first run. A good deal of gangue was passed through the batteries, thereby reducing the average. There is nothing in this send-off to justify despondency, although, it is true, there is no margin of profit. The Directors are confident that the next run will show a decidedly increased average per ton.

THE PHENIX is running full blast. Extra men are being employed every day at this institution. The mine and its surroundings appear to be in a most prosperous condition. The new hoisting engine is being placed in position.

BUTTE.

NUGETTS.—*Mercury*, May 17: N. W. Slater, of Forbestown, came into our office, last week, with a handful of gold nuggets, one of which was valued at about \$140. The balance were valued at from \$5 up to \$12. Mr. Slater has been mining in a ravine near Forbestown for some time, and the nuggets which he showed us were specimens of the kind he was taking out. The mines around Forbestown are showing better indications every day.

CALAVERAS.

WALLACE & FERGUSON MINE.—*Chronicle*, May 18: Extensive improvements are being made in the Wallace & Ferguson mine, at Sheep Ranch. The main shaft has been enlarged and divided into compartments preparatory to erecting new and powerful hoisting works. It is the intention of the company now owning the mine to thoroughly prospect and develop it. With that view the main shaft is to be sunk 100 feet deeper immediately, although there is first-grade ore enough in the levels and stopes now opened to keep the mills employed for a long time to come.

UPPER COUNTRY JOES.—Sinking the shaft in the Doyle mine, at West Point, has been temporarily suspended in consequence of the disabling of the boiler that run the hoisting works. A new one is to be put in and sinking resumed. At Mosquito, the crushing of rock from the San Bruno is completed and the stamps have been set at work on Blue Jay ore. Mr. Holmes is putting machinery on the Albers mine, at Mosquito, and will have it in readiness to run in a few days.

MILL RUNNING.—Messrs. Wallace & Brady, owners of a very promising quartz mine in Wet gulch, Jesus Maria district, who leased the Livermore company's mill, have got the stamps running. They have built a road from the mine to the mill and got everything in such good shape that they expect to be able to keep the battery constantly employed.

SLITER & CO.'S MILL.—All the machinery for Sliter & Co.'s mill, to be erected on their gravel claim, in Old Woman's gulch, is on the ground and will be put up as soon as possible.

INYO.

MODOC.—*Coso News*, May 11: Both furnaces are now running to perfection and turning out 200 bars of bullion every 24 hours, the bars weighing an average of 85 pounds each. Thirty-eight tons of ore are run through each 24 hours. The fact that there were 50,000 bushels of coal on the dump to commence with, a reserve of 10,000 bushels at the kilns in Wild Rose canyon, and the further fact that Mr. Gupitll has put a force of men at work to run the ten kilns, of 42 cords capacity each, and to burn also in pits, and is also purchasing coal from this side of the mountain as well, is pretty good evidence that the Modoc furnaces will run for a long time. Shipment of the rich bullion was commenced on the 8th instant, ten tons being sent to San Francisco, and 20 tons more followed on the 10th. Mr. Gupitll expects to ship ten tons daily, and undoubtedly that amount will be increased, as at present Mr. Arents is running on the hardest ores on the dump to smelt. The mines are looking well and yielding the usual amount of ore, more than sufficient to keep the furnaces supplied.

MINIETTA BELLE.—This company has recommenced operations on the mine which is looking very promising, with a good body of ore in sight, a number of miners have been put to work thereon, and in a short time it is expected that enough high grade ore will be taken out to start the mill up.

NEVADA.

THE OLD MURCHIE.—*Transcript*, May 19: This property which has for some time now occupied a prominent position as one of the leading mines of Nevada county, is by the addition of frequent important improvements daily increasing its yield, and the best feature of all is that the owners are amply repaid for their efforts in enlarging operations. A double track is being laid from the hoisting works to the mill, by means of which the vast amount of labor heretofore used in hauling quartz will be dispensed with, and cars will be used for the purpose of transportation. A new hoiler has been procured for the hoisting works, and it is being put in place at present. The mill is to be also shortly provided with a powerful new engine.

GEORGE SMITH'S MINE.—Drifting is now being vigorously prosecuted in the Smith quartz mine, and the indications are that a week's more dead work will enable the owner to commence taking out pay rock again. This reliable mine has yielded some handsome results for the expense which has been incurred in its development.

THE PIONEER MILL.—The Pioneer Reduction company's quartz mill is kept busy with rock from the depths of the New England and Brunswick mines. The sulphuret reduction works connected with the above extensive enterprise will also be in full operation in a few days.

DERRECK CLAIM.—Rich gravel has been struck in the shaft of this company, sunk on the old buried channel above North Bloomfield. The strike is considered one of importance as proving the existence of the old channel at this point. This greatly strengthens the probabilities of a similar strike in the Watt shaft four miles further up the channel.

PLACER.

YOU BET.—*Dutch Flat Forum*, May 16: The mines are all running and doing well. The English company have cleaned up with very good results. A small slide in the Hussey claim delayed the work some, but they have got it all right again. A general clean-up was made in this mine with satisfactory results. The Nevada company are rushing things ahead lively, and in a few days will have another claim under full headway.

DUTCH FLAT.—A clean-up of over \$4,000 was made in the Baker mine on the 9th, after which a blast of 275 kegs of powder was exploded in the upper end of the pit, doing good execution. As there has been a falling off in the supply of water recently, washing will not be resumed in this mine before another week.

THE HAZARD MINE.—This mine is at present yielding gravel sufficiently rich and extensive to entitle it to a place among the first-class drift mines of California. Much money has been expended here and the owner has met with many reverses. Persevering, he has, after driving a tunnel some 2,000 feet, struck the Weske channel, and is taking out dirt rich in gold. He has arranged his sluices, etc., and commenced to wash, and henceforth we may expect to hear of regular shipments of the "root of evil" from the Hazard mine. The channel from where he struck it to where Weske is working on it, is estimated to be at least six miles long, which will keep them digging for many, many years, and which should contain, at the rate of yield thus far, more millions than ever came out of the Comstock.

PLUMAS.

JAMISON.—*National*, May 11: The mining outlook is first-rate. There will be water in plenty for months, more than the usual number of men will be working in the district, and a good deal of prospecting will be done. O'Neil is running a tunnel into the North Star Lode; the Bunker Hill company, under the management of Superintendent Doherty, are running a tunnel into Mt. Washington. They have a lead and will put up a mill on their ground, on Little Jamison, as soon as the melting snow will permit.

QUINCY.—Horace Smith and Dick Bell are getting out some rich quartz from a new location recently made by them on the head of Black Hawk. They think they will develop a big mine, and we hope they will.

SQUIRREL CREEK.—This portion of Plumas is showing undoubted signs of improvement. A couple of years ago our nearest neighbors were at the Eureka sawmill, about three miles away, and East Nelson was without an inhabitant. Now about a dozen men are at work there, some of them with excellent prospects for success. Paul Serrand, who has incorporated a company, is now running a tunnel to strike a quartz ledge on Bear creek. Chris. Kuck has fixed up a hydraulic and is opening a claim on Poplar creek, close by. Several families of the men engaged on the wood and timber contracts of the company are living in little houses near by; the sawmill has been moved a mile and a half nearer to us.

BUSH CREEK.—*Mountain Messenger*, May 18: This ledge has widened to 12 feet. The gold is distributed through its whole width. The mill was stopped a few days ago to clean up and make repairs. This rich quartz extends along the ledge north from the shaft 60 feet, to a certainty, as it has been found at that distance, and how much further no one knows. Thousands of tons of very rich ore are now in sight, and still the ledges continue to widen as the shaft goes down.

UNDER CONTROL.—The Bald Mountain company have the rush of water under control, and

are working a full force of men. About 30 inches is still running.

PLIOCENE.—The Pliocene shaft was cleared of water last Wednesday, and the work of sinking commenced. The shaft is very wet. The pump seems able to more than keep the water down.

ORIENTAL.—The workmen are still pumping at the Oriental mine near Alleghany, not having succeeded in getting the works quite clear of water. This is not of our own knowledge, but from hearsay.

ARCHAMBAULT reports water failing at Mt. Vernon, and they are about cleaning up for the season.

PAY.—The Golden Star company are finding good pay in their claims, having taken out gravel that paid a great many dollars to the car load.

TRINITY.

PAYING WELL.—*Journal*, May 18: Smith & Lowden, on Trinity river above Lowden's ranch, are doing good work this season and making money. They took out \$3,000 last month, working eight men.

TUOLUMNE.

THE WATER CO.—*Independent*, May 18: This company have completed their flumes and ditches, and commenced laying their seven-inch pipe from the top of Wolding's hill across south Sonora to the top of Schulz's hill, a distance of 2,200 feet, with 58 feet head, to convey water for mining and irrigating purposes, thus supplying a district heretofore without water in the dry season. This will supply citizens at the lower end of town, the Odd Fellows' cemetery, and also the Golden Gate mine.

SPECIMENS from the Ferguson mine, weighing 45 pounds, and containing \$900 in gold, have been sold in San Francisco for \$1,300—the intention being to work them into quartz jewelry.

THE Philadelphia mine has washed up \$4,100 for 10 days of 10 hours each, or \$410 per day. This shows well for a mere prospect.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, May 22: Daily yield, 350 tons of ore, keeping the California mill running to its full crushing capacity. The ore stopes on the 1300 and 1650 levels, where most of the ore is being taken from, show well and are yielding good ore. Retimbering the southwest drift on this level, from the C. & C. shaft, is going steadily ahead. A north drift will soon be started from the 1900 station of the joint Best & Belcher winze on the south line to connect with the south lateral drift now being run in the California ground on the 1950 level. The repairs to the Consolidated shaft are making better progress, averaging about 15 feet per day.

CALIFORNIA.—Daily yield, 400 tons of ore, keeping the Brunswick, Mexican and Morgan mills steadily running. The ore stopes on the 1650, 1600 and 1500 levels continue their usual yield of good ore, and are showing well. The east drift on the 1950 level has now penetrated to within 100 feet of the C. & C. shaft, the face still being in perfectly dry ground, while the bottom of the C. & C. shaft is still flooded with water. The 1950 station is now being opened in the shaft so that this drift and the shaft can be connected in a very short time. The face of the north lateral drift on the 1950 level is still in vein matter. This drift is intended to connect with the north drift on the 1900 level of the Best & Belcher joint winze. The station for the joint Opbir winze on the Opbir 1900 level is about finished.

SAVAGE.—No attempt was made to lower the water in the shaft during the week until yesterday, when the speed of the pumps of both the Savage and Hale & Norcross was increased and the water lowered to a point 32 feet below the 2100 level. This is being done in order that the Hale & Norcross may have a chance to put in another lift pump at a point 50 feet below the 2100 station. The east drift on the 1640 level has passed through the low-grade ore recently struck. The working facilities of this level have been greatly benefited by the erection of an engine and the forcing down of a circulation of good air.

OPHIR.—The ore in the bottom of the winze below the 1900 level still continues of good quality, and covers the entire size of the winze. Just how much more there is cannot be told until the 2000 level is reached, and east and west crosscuts are run. This winze is now down 93 feet, with a slight seepage of water coming in at the bottom. The station in the joint California east crosscut on the 1900 level is about completed, ready to start a winze downward to reach the 2000 level.

JULIA CON.—The water was entirely drained from the station and drift on the 2000 level day before yesterday, and men are now at work repairing the drift and putting everything in first class order for commencing the crosscutting of the ore vein. As soon as the drift is repaired and cooled, a crosscut east will be started to follow up the diamond drill hole recently run in which the favorable prospects were found.

YELLOW JACKET.—The north winze below the 2200 level is now down 278 feet, following the slope of the ledge. The bottom is in clay, quartz and porphyry and quite hard and dry. The stone dam on the 1730 level, to keep back the water flowing in from the "west country" at that point, is fast approaching completion. The large expansion and initial cylinders of the powerful new pumping engine, are in place.

SIERRA NEVADA.—Three drifts have been started and are now being run from the 2000

station in the south winze. Two of these drifts are crosscuts, one running east and the other west. The other is a main south lateral drift running in the vein. Immediately after opening this station a fine vein of solid, healthy-looking quartz was encountered, which gave low assays, but has not as yet developed anything of much value.

UTAH.—The south drift on the 1350 level has advanced to within 52 feet of the south line, leaving only about 125 feet for that and the north drift on the same level in the Sierra Nevada to connect. This air connection, when made, will greatly benefit both mines.

CROWN POINT.—Work in the mine is now confined to the running of the south drift on the 2300 level, to connect with the north drift from the 2360 station of the Belcher drain shaft.

JUSTICE.—Daily yield, 80 tons of ore. The ore stopes on the 800 and 900 levels do not show so well, much of the good ore having given out. The south drift on the 1300 level is showing a steady and favorable improvement.

CROWN POINT RAVINE.—Sinking the shaft deeper below the 300 level is making good progress. When the 400 level is reached, a drift west will be started to intersect and develop the large and promising ore vein found on the 300 level.

LADY WASHINGTON.—The face of the north drift on 1150 level is showing some very rich though small veins of ore.

SILVER HILL.—The east drift on the 900 level is steadily advancing, the face in a splendid vein formation, the quartz being of a much better quality than the most of that found on the levels above. The north drift on the 800 level is showing more ore.

BELCHER.—Sinking the south winze below the 1900 level is making good progress, the bottom in quartz and vein matter mixed.

GOULD & CURRY.—The west drift on the 1900 level is repaired, and the rock excavated in sinking the shaft is now run down to that level and hoisted through the east winze to the 1700 level.

CON. IMPERIAL.—The south drift on the 2400 level from the joint Alpha winze will connect with the north drift from the south winze in a day or two more, giving a much needed circulation of good air.

BEST & BELCHER.—The hoisting engine, cages and other machinery for prosecuting the work in the joint winze on the Con. Virginia line, is all in first-class order.

SUTRO TUNNEL.—During the past week the header has made about the usual rate of advancement, although the material passed through requires more careful and secure timbering than heretofore. Total length of tunnel last evening, 19,689 feet.

SUCCOR.—Owing to a breakage of some of the hoisting machinery, no work has been done in the mine during the week.

BULLION.—The work of sinking the main incline is going vigorously forward, the bottom still in good blasting ground. The east drift on the 1840 level is steadily advancing, the face in very favorable vein matter. The progress of the east drift on the 2000 level has been considerably interfered with by a strong flow of water, which was struck some days ago, but which is gradually subsiding.

HALE & NORCROSS.—The water is being steadily lowered to-day in order to enable the putting in of another lift pump at a point 50 feet below the 2100 level. Cleaning out and repairing the north drift on the 2100 level has made very rapid progress during the week, 100 feet of the drift having been repaired.

LEVIATHAN.—During the week somewhat better progress has been made sinking the incline below the 600 level, the rock being a little softer than it was last week, with more quartz seams coming in.

WARD.—Sinking the main shaft is being pushed steadily ahead, the rock in the bottom blasting out finely and the flow of water giving little or no trouble. An average of 2½ feet per day is made with the sinking.

ALTA.—Sinking the main shaft is going steadily ahead. It is now down 1400 feet. The flow of water is still strong.

CARBONATE POINT DISTRICT.

A PROMISING MINE.—*Sentinel*: This district, which is situated about 100 miles south of Sand Springs, is looming into considerable notoriety. During the past year two men have been working a location at that point, and have developed a very handsome mining property. They started in \$15,000 in debt, and have since taken out and shipped to San Francisco a large quantity of ore, realizing sufficient profit to not only pay off their indebtedness but to purchase, for cash, hoisting works and machinery of capacity to work the mine systematically and cheaply. Messrs. T. J. Bell and John Durning have taken a contract to burn a large amount of charcoal, from which we infer that the product of the mine is smelting ore and that a furnace will also be built. The nearest point to the railroad is Wadsworth, a distance of about 100 miles, and the same parties will establish a line of six-horse stages between the two places. A store will be started at Carbonate point, and Mr. Reveal will take charge of that portion of the enterprise. Mr. Durning is now in Eureka making arrangements to sub-let his coal contract, and will send out a force of coal burners as soon as practicable. We are indebted to him for the above item.

Continued from page 321.

The small volatility of ether gives only insignificant tensions, the latter being from one and a half to three pounds (above zero), at 23° to 27° Fahr., so that a very large pump is required to draw up a certain quantity of ether vapor.

The first half of the process being conducted under almost a complete vacuum, the least leak in joints, stuffing, hoxing, etc., will suck in air, which will seriously impair evaporation. After frequent evaporations and condensations, the ether becomes acidified, and is transformed into a less volatile isomeric body. This demands a frequent change of the liquid, at once a troublesome and expensive operation.

It also combines with the lubricants used for the piston of the pump; the resulting mixture is carried all through the apparatus, disturbing its regular working. A source of great danger is the easy inflammability of the ether, which almost excludes it from use on ships, or in other exposed situations.

By the use of sulphurous acid, (sulphurous anhydride, SO_2), most of the above mentioned difficulties are almost completely overcome. This exceedingly volatile liquid evaporates under atmospheric pressure at a temperature of 14° Fahr., and its tension at 95° Fahr., is only four atmospheres, it can thus be worked in all climates, under a moderate pressure. It does not act on metals or fats, but on the contrary, forms an excellent lubricant for the piston, etc., of the compressing pump. It is not combustible, but on the contrary is an excellent fire extinguisher, which is of great value on hoard steamers, etc., and also being very stable and indecomposable (if not in contact with water), a renewal is never necessary, except to supply the small quantities lost by leakage. The vacuum in the refrigerator is only from two to three pounds below the atmosphere, thus air will have no great tendency to enter, even should there be leaks.

Mr. Raoul Pictet, of Geneva, Switzerland, was the first to apply this liquid to the manufacture of ice and the production of cold on a large scale. The process for its manufacture discovered by him makes it the cheapest of all known volatile liquids.

The Pictet Artificial Ice Company of New York, which is the owner of the patent for the United States, has erected a complete apparatus to manufacture 24 tons of ice per day.

The plan and prospective views show the entire arrangement, except the boilers, which are in an adjoining building.

A is the engine, driving, by a prolongation of its piston rod, the acid pump, B, which is double acting. C is a rectangular iron tank, containing two cylindrical refrigerators of copper, D D, which are filled with copper tubes. Inside these cylinders, in the space surrounding the tubes, the evaporation of the sulphurous acid takes place and the cold produced thereby is imparted to the mixture of glycerine and water, which is then circulated in a way to be described further on.

Through the pipe, e, the vapor is sucked into the pump, B; on the return stroke it is compressed to about one-fourth of its volume, the pump being surrounded by water to absorb the heat generated by compression. The pump-rod is hollow and has water circulated through it to keep it cool and prevent damage to the stuffing-box packing.

When the vapor is compressed, it is forced through the pipe, E, into the cylindrical condensers, F F, placed vertically in an upright iron tank, G. The condensers are filled with tubes similar to the refrigerators, and cold water is pumped into the tank, circulating first through the tubes and then around the cylinders, cooling the compressed vapor to about 65°, whereby liquefaction is attained. The small pipes, a a, reaching to very near the bottom of the condensers, conduct the liquid again to the refrigerator, the flow being regulated by the small valves, b b.

On entering the refrigerator, the liquid evaporates, absorbing great quantities of heat, and thus it goes through the same process over and over again, each evaporation producing a certain quantity of cold.

The freezing liquid of glycerine and water is conducted by the pipes, d d, to a large tank, H, into which the hoxes, containing the water to be frozen, are immersed. The liquid enters at both ends of the tank, circulates around the partitions, e e, as shown by the arrows, and is finally drawn out at f by the pump, I, which returns it to the tank, C, where, by circulating around and through the refrigerators, D D, it is cooled and then again resumes its flow through the freezing tank, H.

The hoxes containing the water to be converted into ice are 12 by six inches and four feet high; they are made of sheet-iron, and, after being folded together, are galvanized, which makes them absolutely tight, so that the water in them can never become contaminated by any impurities contained in the freezing liquid which surrounds them. The boxes,

when immersed in the tank, are closed on top by a wooden cover and the entire tank is covered by hoards and woolen blankets to prevent any radiation of the cold. An iron swing-crane, K, sweeps over the entire tank, to facilitate the handling of the hoxes. Those that are frozen are taken out and put into the small tank, L, containing hot water, and after a few minutes the block of ice is sufficiently loosened to drop out of the hox; the ice is then stored away while the hox is filled with fresh water and goes back to the freezing tank. The ice produced by this machine is hard and clear and is about 10% more enduring than natural ice, which has been frequently tried by putting a piece of natural and a piece of artificial ice of the same weight together on the floor, when the natural would be melted first. This seems probable, when it is considered that the freezing liquid is kept up at about 19° to 20°; a temperature a very little above that can thus be imparted to the ice if left in the tank a sufficient time. Natural ice, however, its under side being always in contact with water of not less than 32°, will never be much below that temperature, although its top may be colder.

The prospective and plan views show the 24-ton plant, for a long time in operation in New York city, and now sold to Richmond, Va. The refrigerator is a plain copper, tubular boiler, immersed horizontally in a tank in the background and charged, once for all, with 1,760 pounds of the anhydrous sulphurous oxide. Through the tank a mixture of glycer-

inations of wood lined with felt, and the space between filled in with sawdust. The floor should be covered with a wooden grating, and two doors are necessary.

In all cases a supply of water must be provided for the oxide condenser, the cooler the better. When water is scarce, and it is necessary to use the same water over and over again, particularly in hot climates, it will be advisable to provide a shallow tank of sufficient capacity, placed under ground for the sake of coolness, and in which the water may spread over a large surface. A circulating pump is required to pump the water.

The smallest machine that is manufactured at present produces about 30 lbs of ice per hour, while the largest has a capacity of one ton. The Pictet Artificial Ice Co., of New York, is building machines for cooling industrial establishments in Chicago, and also one making 50 tons of ice per day for St. Louis; also marine engines for refrigerating and making ice for supplying an abundance of ice for the whole voyage of the vessels of the new Brazilian S. S. Line built by Messrs. Jno. Roach & Son.

For breweries these machines are of great value, and many have already been erected in hot climates where the brewing of beer formerly had been an impossibility. In this connection, it must also be considered that the erection and maintenance of costly ice houses can be dispensed with.

When the machines are to be used to produce cold air for cellars, warehouses, the holds of

DIAGRAM OF PICTET ICE MACHINERY.

ine and water is circulated by a rotary pump, shown at the left.

The steam engine employed is a Corliss engine, the pressure of the piston of the steam cylinder never averaging higher than 30 pounds per square inch. Generally it is advisable to have the ice machinery complete in itself, with its own steam engine, which can be of any system.

Cakes of ice can be made of any size desired, the greater the thickness the longer the time of freezing; and to obtain a given daily production with thick blocks, the size of the tanks and the number of cans must be increased over that necessary to obtain the same weight of ice in thin blocks.

For handling small blocks of ice, manual labor is sufficient; with six-inch blocks and upwards, a crane becomes advantageous.

In removing the ice from the cans, it is best to reverse the latter and stand them against the wall; the heat of the room gradually loosens the ice from the sides of the can and it slides down. A more expeditious method is to lower the cans into a small water tank heated occasionally by a steam jet, but the waste of ice is increased.

The tanks containing the refrigerator and condenser are generally of iron, as well as the large tank containing the ice cans. The sides of the refrigerator tank and ice tank are isolated by sawdust, charcoal or mineral wool, between the iron and the outer wooden side.

Natural ice is frequently milky and snowy, but the ice obtained by artificial means is not only compact and solid, but it can be made absolutely transparent.

To obtain ice as clear as crystal, the patented process of Mr. Turettini, of the firm of Raoul Pictet & Co. is applied; the cost of production is increased only a few cents per ton, and the process can be adapted to any size of machine.

When buildings already exist, the disposition of the machinery is made to suit the same. It is preferable, however, to erect a special factory in which the machinery can be set to the best advantage, the boilers being placed in a separate room, isolated from the rest of the building, in order not to increase the temperature of the latter.

It is advisable to arrange an ice house adjoining the factory, in which to store a certain amount of ice. The ice house, or room used for that purpose, should have double walls or par-

ships carrying meats, fruits, etc., the freezing liquid, after leaving the refrigerator, is circulated in a tank containing a number of pipe coils, through which the air to be cooled is forced by a blower.

For skating rinks this system has come into extensive use; those who are familiar with these agreeable and exhilarating resorts will certainly rejoice that this invention makes them independent of all the caprices of the weather, and enables them to enjoy the pleasure of the rink even on the hottest summer day. Skating floors now used in England, the invention of Mr. John Gamgee, are formed of a number of flattened metallic tubes, placed side by side on a bed of concrete or asphalt. The interior of these tubes is kept filled with an uncongealable mixture of glycerine and water, which flows in from an elevated cistern, where it is cooled by machinery similar to that described above. The tubes are sprinkled with water spray, and after this is frozen, water is again sprinkled over it, until a smooth mirror of ice for skating is obtained.

As this invention is not yet fully developed, it is impossible to foretell what its capabilities are, and what impact it will give to progress in different manufactures and industries, but it seems destined to play an important part in the restoration of the commercial and industrial prosperity of this country.—*Polytechnic Review*.

Heat in the Lower Levels of the Savage Mine.

There is still one very hot place ahead in this mine. It is in the 2200 level. In approaching that point the heat will be so great in the incline that it will be almost beyond human endurance. It is now intensely hot below the 2100 level, but the heat will be very much greater before the 2200 level is drained. The heat and steam now ascending is only from the small surface of water exposed in the incline. The critical time will be when the water begins to fall away from the roofs of the long drifts and other openings on the 2200 level. Then the steam and heat rising from a great surface of water will move to the incline, up which it will rush in seething, blinding volume. At present the steam is kept back and only escapes from the comparatively small surface exposed in the incline. In approaching the 2000 level the workmen in the Savage experienced something of what will be seen at the 2200. As the water began to recede on the 2000 level a great amount of surface was exposed, from which rose a vast deal of steam and heat, all of which poured up the incline on its way to the surface. While the level was in this condition it became necessary to connect a pipe with the donkey pump. The men sent down to do this work several times advanced to the pump, but as often retreated, finding it impossible to face the scalding and blinding heat. They finally declared that there was no use in trying to make the connection—that no human being could face the heat. Being determined not to be beaten out of the incline, the foreman finally induced a man to go down the incline with him and assist in nailing a sheet of canvas across the compartment just below the point where the pump was standing. The canvas was nailed up and it served such good purpose in turning aside and shielding the men from the direct current of heat and steam that they were able to make the desired connection. While holding up the canvas to nail its upper corners the foreman had the back of the fingers of his left hand scalded to a blister. In approaching the 2200 level the same great heat will no doubt be encountered. It was not noticed at the 2100 level, as there were no large openings at that point; nothing but a station.—*Enterprise*.

Value of Alkali Soils.

Every State and Territory west of the Rocky mountains contains more or less alkali land, the aggregate in Utah and Nevada being very great. Where this salt is present in large quantity the soil in its natural state is wholly unproductive, and even the lands but slightly alkali have heretofore been considered nearly worthless. Prof. Hilgard, of the Agricultural Department of our State University, has been engaged for some time past analyzing the various soils found in California, paying especial attention to this class. The result of his investigations goes to show that the popular idea concerning alkali lands is at fault; that instead of being valueless, they in reality carry a large proportion of the richest fertilizing ingredients. For instance: The alkali soils in the vicinity of Stockton are found on an analyses to contain large quantities of phosphates. Soil from the alkali plains of Merced contains a large percentage of niter, an article which is shipped in large quantities from Chile and Peru. The alkali soil in the vicinity of Anaheim is again rich in potash. With the employment of gypsum as a neutralizer of the alkalies, Prof. Hilgard thinks these soils can be made the most productive in the State. In attempting to reclaim the more heavily alkali lands of Nevada and Utah more difficulty would, of course, be experienced than with the soils above mentioned, yet there is little doubt but even these can be rendered fit for tillage, and perhaps in their natural state would successfully grow certain kinds of vegetables.

A GUARD AGAINST OVERWINDING.—An apparatus to prevent the overwinding of hoisting cages was put in operation at the Crown Point mine last Sunday. It has proved a perfect success. It is the invention of Thomas Lane, the well-known engineer and machinist. It is very simple in construction, and there is nothing about it to get out of order. The hand of the dial does all the work of stopping the cage. When it moves round to the point which indicates that the cage is nearing the mouth of the shaft, the hand comes in contact with the end of a lever, which moves a second lever attached to the end of a rod which reaches to the engine, and there moves a third lever that gradually shuts off the steam and stops the machinery. We yesterday saw several trials made of the apparatus, and it never failed to shut off the steam and stop the engine at the proper point. At almost any other works on the lead there is more margin between the point to which a cage must be hoisted and the point that would crush it in the sheave, the distance being but about two and one-half feet. This is on account of the very low galloways-frame, and because of their having put on double-decker cages when their frame was intended for cages carrying only a single car. Although the trials we saw were made with empty cars on the cage—a test more severe than if the cars had been loaded—the cage always stopped at the proper time, though the engineer turned on a full head of steam and stepping back let the engine have its own way.

Sale of Government Timber Lands.

The bill prepared by Senator Sargent authorizing the sale of certain public timber lands, has been passed by the Senate, almost insuring its becoming a law. This bill provides that any surveyed lands in California, Oregon and Washington Territory, not reserved, and valuable chiefly for timber and unfit for cultivation, and which have not been offered for sale, may be sold in quantities not exceeding 160 acres to any one person or association at a minimum price of \$2.50 per acre; and that lands chiefly valuable for stone may be sold on the same terms. Nothing in this act is to impair any bona fide claim under any United States law, or authorize the sale of any mining claim or mineral lands, or interfere with the rights of ditch owners. Any person desiring to buy such lands is to make very much such an application and proof as to the character of the lands and its being vacant, etc., as in the case of mining land purchases. He is required to subscribe to a stringent oath that he buys for his own use and not for any other person. A provision is made for hearing all adverse claimants. Other sections of the bill made it unlawful to cut or destroy any timber on public lands with an intent to export or dispose of it, under a penalty of a fine of not less than \$100 nor more than \$1,000; but permission is given any miner or agriculturist to take such timber as is necessary in the ordinary working of his mining claim, or preparing his land for tillage, or in support of his improvements. Parties now being prosecuted in California, Oregon or in Washington Territory, excepting such as have cut timber for exportation, are to be released on payment of \$2.50 per acre for all lands from which they have taken timber. They are not, however, to acquire title to the land by the payment of the penalty, but will have the same rights as other persons to purchase under the provisions of this bill. The speedy passage of the bill, and especially of the last section, without opposition, was surprising, but was accounted for by the fullness of Sargent's explanation of the need for it when presenting the California memorial on the subject recently.

Renaming a Mountain.

The *Inyo Independent* says that Mr. Hutchings, of Yosemite valley fame, is preparing an exhaustive article upon the subject of the high Sierras, comprising the high peaks, their proper nomenclature and respective location which has caused so much discussion. He supports the name given the high peak by the Lone Pine fisherman, and in his report will give descriptions of all exploration, notices of discovery, etc. He quotes Lieut. Wheeler's data, according to which the height of Fisherman peak (or New Mount Whitney) is 14,448 feet. Old Mount Whitney—the peak which was so designated—lies about five miles to the south-east of Fisherman peak, and has an altitude of 14,094 feet above sea level, as determined by barometer.

We suggest that a more appropriate name than the one here mentioned be found for this noted peak if it is to be divested of its present name. It is all right that the name of Whitney he applied to the highest of these peaks as was the original intention; but wherefore call the other "Fisherman peak" in the event of its being relieved of its present name? Who ever fished upon it, or by what party of fishermen was it discovered, that it should be so designated? Rather let it for the present remain nameless than attach to it this seemingly senseless and unmeaning appellation.

COLORADO'S MINERAL BELT.—By consulting Lieut. Wheeler's new triangulation map, it will be seen that a line drawn through Silverton, at the southern extension, and Gold Hill, in the northern portion, will cut through the center of one of the largest mineral belts in the known world, and a particularly interesting feature is that boundary lines drawn on each side, at a distance of 15 miles from the center line, will take in every known quartz ledge in Colorado. Here then we have a belt about 30 miles wide, traversing the State in a northeast and southwest direction. Georgetown, Mt. Lincoln and Lake City lie directly in the center of the belt. Sunshine and Central City lie a little to the east of the center, Ward and Caribou a little to the west. All of the noted placer diggings also lie within this belt, although at points, like the Platte river at Denver, light float gold has been carried beyond its limits. These facts should prove of advantage to prospectors, as it is safe to say that the nearer the center of the belt the more likely will one be to get large hodies of ore.—*Sunshine Courier*.

THE MODOCOS.—These Indians located in the northeastern part of the State have advanced rapidly towards civilization since being placed on their reservation in 1873, and after this year they will be able to get along without assistance of any kind from the government. They now own 4,000 acres of land, on which they have built good houses, have fenced in and have under cultivation over eight acres to each person in the colony. They have 120 acres of wheat, 175 of corn, and 236 head of cattle, and have cut 140 tons of hay. Besides they have plenty of poultry, etc. Fifty-nine children attend school.

USEFUL INFORMATION.

Construction and Care of Tools.

A veteran mechanic writes for the *Railroad Gazette* some of his experience on the construction and care of the fine tools of the machine shop. He says: One class of lathes is made light, and although the workmanship may be first-rate, and everything about them handy and easy to handle, and quick to change from one job to another, they are still so constructed that they are short-lived, soon wear on the ways where most used; a great deal of tremendous polish with knick-knacks, sharp corners and cabinet-maker sofa-legged ogees. That sort of thing is an abomination in the eyes of Sir Joseph Whitworth, Sellers, Freeland and Moodna, of Orange county. Their plan is to make everything as plain as possible, with round corners and perfect workmanship. Bodmer, an ingenious Swiss, some thirty or forty years ago was in partnership with Birley, of Manchester, England. He was considered the most particular machinist in the world, and manufactured tools for his own use. His lathes were constructed something like Whitworth's, with conical steel journals in the lathe spindles, steel-hardened bushes ground on the same principle as Whitworth's templates, compound slide rests, etc. He would discharge a man for laying a hammer or a wrench on the bearers or shears. The consequence was that his tools after being in constant use for 13 or 14 years were in such excellent order that they sold for above their value when new.

My experience in some shops is the reverse of the above. Some 25 years since there was a splendid lathe came into a machine shop in Buffalo from Moodna, Orange county; 18-inch heads from the centers, with compound slide-rest. The fast head-stock was so constructed that the largest possible cone and wheel would swing, and a small pinion on the back-shaft. The cone probably made 16 revolutions for one of the spindle, thereby increasing the power enormously. There was a face-plate, as large in diameter as would swing, with four slots, and the rest square holes, very stiff; no spring to it. The following head-stock was in proportion: a splendid tool. A first-class workman was put on it, and after running it some years left it in good working order without a scratch. Afterward some cheap, inexperienced man got hold of it and made a total wreck of it.

In my opinion, if more attention was paid to power and stiffness and good wearing, long hearings in the construction of machinists' tools, and less to ornamental gingerbread flourishes and nonsensical sharp corners, they would give better satisfaction in the long run.

SOME FACTS ABOUT BREAD.—Professor F. de Chaumont, in the report of the French army medical department, gives the results of some investigations he has been making with regard to the weight and nutritive value of bread. One fact which he states might have been anticipated, namely, that the amount of crust has a good deal to do with the loss of moisture in cooling and subsequently. Where several loaves are baked in one mass, an inside loaf, with crust only at top and bottom, loses about three per cent in cooling; one with four sides crust loses two per cent; and one baked singly, with six sides crust, only about three-quarters of one per cent. The loss by drying afterwards is proportionally more rapid in the loaf with less crust; so that this becomes unpalatably dry much sooner than the loaf well walled in with crust. The amount of solid matter in crust is about 90%, in the crumb only about 63%. In bread of first-rate quality the crust should form 30% of the whole weight, but often it is little more than half as much. For army use, or wherever bread is to be kept for some time and transported for considerable distances, it is important that it be thoroughly baked. The amount of acidity in bread—a point of some interest, which has never before been definitely determined—has been investigated by Dr. de Chaumont. Taking a known quantity of bread, he digested it in a certain amount of water, and then treated it with standard alkaline solution. This process showed an amount of acidity equal to 4.06 grains of crystallized oxalic acid, or 3.55 grains of glacial acetic acid, for each pound of (fresh) bread—an estimate of acidity which may be provisionally adopted as the standard proportion.

OFFICIAL LABOR INQUIRY.—Secretary Evarts has sent a circular to all United States Consuls abroad, requesting reports on the following subjects: First, the price of labor among laborers of all classes; second, cost of living to laboring classes; third, comparison of the present cost of living and rates of wages with that for the last ten years; fourth, cost of produce and its market price; fifth, amount of paper money in circulation and its relative value to gold and silver, together with its fluctuations during as many years as can be accurately obtained, and the causes which have produced the fluctuation. Intelligent responses to these inquiries cannot fail to furnish a mass of valuable information bearing on social and economic questions. The result will be to show that in spite of hard times and other drawbacks the American people are better off than any other in the world, with less cause for complaint or political agitation.

The Influence of Surroundings.

The surroundings of the place of labor have more influence upon the operative than many are aware of. Give a workman clumsy tools to work with, a rough, dirty, hench to work upon, imperfect light, scarcely elbow room, and but little care exercised respecting proper ventilation and warmth, and he will become careless, his work partaking of the character of his surroundings; he will think more of his wages at a certain time than of the completion of his work. A few years of this experience will spoil almost any workman, no matter how good he may be. But give him, on the contrary, good tools to work with and an airy and agreeable place in which to perform work, and he will insensibly take more pains with it than in a badly arranged room. In a pleasant room he will, of his own accord, keep his tools and work in good order and more cheerfully perform the task assigned to him. A kind of magnetic influence of the surroundings will infuse itself into the operative, and his work will partake of that and go from him stamped with the impress of the influence thus created. This applies with equal force to the workshops in connection with many ironmongers' places of business. General repairing often carried on in rooms wretchedly lighted and ventilated, will do much to induce the workman to take less pains in turning out satisfactory work.

UTILIZING BITS OF SOAP.—Instead of throwing away the pieces of soap which become too small for convenient handling, make a square flannel bag of suitable size; leave one end partly open, and put in the pieces as they collect; when it is full baste up the opening, and it makes a nice bath-tub arrangement. Another way is to add a little water, set them in a tin on the stove, and let them simmer slowly. When cold, you will have tolerably good soft soap, just the thing for putting in your wash boiler or washing tins with. Or by evaporating part of the water you may get the soap hard enough to be molded into small cakes, which can be dried for use.

BURNING CHIMNEYS.—An exchange says that a burning chimney, when the soot has been lighted by a fire in the fire-place, can be extinguished by shutting all the doors in the room, so as to prevent any current of air up the chimney; then by throwing a few handfuls of common salt upon the fire in the grate or the hearth, the fire in the chimney will be immediately extinguished. The philosophy of this is that, in the process of burning the salt, muriatic-acid gas is evolved, which is a prompt extinguisher of fire.

GOOD HEALTH.

Dangers of a Chill.

The *Herald of Health* gives pointedly the results of cooling off too rapidly when one becomes heated by extra labor. It enumerates the following diseases as traceable to this cause: Rheumatism, consumption, Bright's disease, pneumonia, bronchitis, stiffness of the joints, dry neck, pleurisy, catarrh, etc. The following is the method of the evil: The coolness of the evening air is very refreshing to a laborer after a hard day's work in the hot sun, but it is as dangerous as it is agreeable. During the day his garments have probably been wet with perspiration, and if still damp or wet when the cool of the evening comes, he experiences a chilliness and arrest of further perspiration. The blood does not circulate freely near a chilled surface, and congestions or undue accumulations in internal organs are the consequences. From such congestions of important organs come arrest of secretion; the liver, for example, when engorged with blood, ceases to separate bile from the circulating fluids, and an attack of jaundice follows. Or congestion may occur in the respiratory organs, and pneumonia, bronchitis, or pleurisy may result. An arrest of the secretions of the skin or kidneys may terminate in inflammation of the joints, lumbago, sciatica, or some other rheumatic affection. Furthermore, the diarrheal affections so common in the summer season, are frequently caused by exposing the body to a cool current of air after having been heated, although they are usually ascribed to the eating of some food that is supposed to disagree with the digestive organs. While the latter is true in some cases, the most frequent cause is undue exposure of the body, especially at night, by going to sleep in front of an open window on a hot night, without sufficient covering, forgetting that it constantly becomes cooler toward morning; and so the surface of the body is chilled, and the blood retreating to the internal organs produces congestions that result in diarrhea, dysentery, etc.

The Detection of Sewer Gas.

The deadly poison which exhales from the sewers, and makes our city sleeping rooms breeders of fevers and diphtheria, is sometimes a difficult thing to detect. A writer in the *Manufacturer and Builder* says that the odor is not a safe criterion. In the first place, the sense of smell is so different in different individuals, that some will smell absolutely nothing while others do so very plainly; secondly, a bad odor may or may not be accompanied by injurious gases; thirdly, it is not known that the dangerous miasmatic germs floating in the

air of sewers or sewer gas have themselves any odor at all, or perhaps only a scarcely perceptible odor; so that they mix with air and can be inhaled without being at all perceived by the individuals exposed in localities subject to sewer communication. One of the most sensitive tests is a solution of permanganate of potash, which is of a brownish pink, and changes its color by the presence of organic bodies in the air to which the solution is exposed; at the same time it purifies the air. It is a substance very rich in oxygen, which it keeps loosely combined, and therefore easily gives off in a condition as active as ozone, and so oxidizes and destroys all germs it comes in contact with. We would recommend a disinfecting of the locality by often using an atomizing spray of this solution. It will even discolor in the air of an ordinary bedroom, but not so rapidly as when sewer gas or other injurious odors are present. Other disinfectants are bromalum, sulphate of iron, and carboic acid; they are all far superior to chlorine, which is a destructive agent, acting most powerfully on substances on which its action is not wanted, namely, on metallic objects—it ruins them, and produces such an offensive smell as to force people to open all doors and windows. Some go so far as to maintain that this is all the good it does. One thing is certain, that it is no protection against sewer gas. We will state in closing, that the time it takes for a solution of permanganate of potash to discolor gives a pretty fair estimate of the amount of impurities floating in the atmosphere when a flat dish containing it is exposed. You must first boil the water in which you dissolve it, because if you dissolve it in ordinary rain or well water this may contain impurities which will change the color, especially when the solution is much diluted. If it is well made and the air kept perfectly pure, it will not discolor soon, and the shortness of time is a warning of danger.

OVER-EATING.—If the food is wisely chosen there is not much danger of over-eating. Dr. Beard says: "It is a fallacy to suppose that people, as a rule, eat too much, and that most of the diseases of the world come from over-feeding. The truth is that among all decent or civilized people the tendency is directly the reverse. In this country, and especially in our large cities, far more are under-fed than over-fed. Throughout our land thousands and thousands die every year from actual starvation. Some of those unfortunates are little children whose parents are too ignorant or too poor to give them what is necessary to sustain life. But many of them are adults, whom hard poverty or sad ignorance has forced into a habit of systematic though undesigned starvation. Day after day the vital powers slowly fade, the strength grows less, the spirit becomes morbid, and the face wan and dejected. Disease now steps in, attacks and carries by force some important citadel of the body, and death follows. The process is a slow one—sometimes very slow—extending, perhaps over many years, but it is oftentimes as sure as it is slow. An injudicious choice of the kind of food, either from whim or avarice, may also produce results equivalent to starvation."

AN ANTIDOTE FOR STRYCHNINE.—An instance of the prompt and successful use of an antidote in a case of strychnine poisoning is circumstantially narrated in *Nature*. A favorite Skye terrier had accidentally obtained and eaten the poison, which was intended for mice. The amount taken by the dog was probably about a sixth of a grain. When found, the animal was rigid and apparently lifeless, except having an occasional spasm. The owner consulted authorities and found that a dose of chloral hydrate was the antidote prescribed in such cases. To kill a rabbit, 21 grains of the chloral is sufficient; the dog was twice the weight of the rabbit, and the owner of the terrier therefore proceeded to inject 45 grains of chloral (in solution) under its skin. About 15 minutes afterward, supposing the dog was dead, the owner applied his hoot to it, probably feeling a little disgusted with the result of his experiment. To his great surprise the terrier struggled to his feet. Shortly afterward it took some milk, and subsequently, though not for a while very lively, it seemed none the worse for its experience. The essential point in this treatment is that the dose of chloral should be strong enough to kill, otherwise it may not be sufficient to overcome the effects of the strychnine.

BRAIN STIMULANT.—The best possible thing for a man to do when he feels too weak to carry anything through is to go to bed and sleep as long as he can. This is the only recuperation of brain power, the only actual recuperation of brain force, because during sleep the brain is in a state of rest—in a condition to receive and appropriate particles of nutriment from the blood, which take the place of those which have been consumed by previous labor; since the very act of thinking burns up solid particles, as every turn of the wheel or screw of the steamer is [the result of consumption by fire of the fuel in the furnace. The supply of consumed brain substance can only be had from the nutritive particles in the blood, obtained from the food eaten previously, and the brain is so constituted that it can best receive and appropriate to itself those nutritive particles during the state of rest, of quiet, and stillness of sleep. Mere stimulants supply nothing in themselves; they goad the brain and force it to a greater consumption of its substance, until it is so exhausted that there is not power enough left to receive a supply.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Pictet System for Manufacturing Artificial Ice, 321-26. The Week; What is Needed to Make Mining a More Perfect Success; New Almaden and Guadalupe; Notices of Recent Patents; When He Was a Miner, 323. The Manufacture of Dynamite or Giant Powder in England; An Assay Outfit for One Hundred Dollars; Thomas Edison and the Phonograph, 329. Patents and Inventions, 332.

ILLUSTRATIONS.—Machinery for the Manufacture of Artificial Ice by the Pictet System, 321. Diagram of Pictet Ice Machinery, 326. Thomas Edison, Inventor of Telephone and Phonograph; The Phonograph with Sectional View of Diaphragm, 329.

MECHANICAL PROGRESS.—Points on Rotary Cutters; A Novel Method of Inlaying Wood; Car Lighting; A Great American Gun; A Monster Locomotive; Our Machinery Show at Paris; Dangerous Boilers; Iron Bolts, 323.

SCIENTIFIC PROGRESS.—Our Distance from the Sun; The Influence of Heating on Wheat; Death of Prof. Henry; The Ocean's Floor; Microscopic Examination of Bee Stings; Garnet in Corundum, 323.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards, Notices of Assessments, Meetings and Dividends, 324.

MINING SUMMARY from the various counties of California, Nevada, Arizona and Dakota, 325.

USEFUL INFORMATION.—Construction and Care of Tools; Some Facts About Bread; Official Labor Inquiry; The Influence of Surroundings; Utilizing Bits of Soap; Burning Chimneys, 327.

GOOD HEALTH.—Dangers of a Chill; The Detection of Sewer Gas Over-Eating; An Antidote for Strychnine; Brain Stimulant, 327.

NEWS IN BRIEF on 332, and other pages.

MISCELLANEOUS.—A Forward Step in Astronomy; Sulphur and Quicksilver; Doing and Over-doing; Mines That Have Never Been Found; The Pumping Machinery for the New Yellow Jacket Shaft; Locomotive Performances; Gold Mining in Georgia, 322. Heat in the Lower Levels of the Savage Mine; Value of Alkali Soils; A Guard Against Overmining, 326. Sale of Government Timber Lands; Retaining a Mountain; Colorado's Mineral Belt; The Modocs, 327.

The Week.

The past has been to the people of this coast a generally auspicious week. For most kinds of labor there has been an increased demand, growing out of the advent of the hay-making season, and the near approach of the cereal harvest. In some parts of the State there has even been an insufficient supply of field hands to meet the wants of the farmers. The cool and lowering weather with a slight rainfall, has proved favorable to both our agricultural and mining interests, having tended to prevent the snow melting on the mountains, as well as a too rapid ripening of the grain and a drying up of the pasturage. The labor movement, while it continues to occupy the earnest attention of the working men in the larger towns, assumes every week a less threatening aspect; and there is little doubt but that it will take on a milder form when the grain harvest, now also at hand, shall have afforded remunerative employment for all who desire it. We have as yet had no strike for higher, or the retention of the old rates of wages, such as have occurred in the Eastern States and Europe, nor is that issue likely here to be made between the operatives and employers. With us it is a question of work rather than wages, the mildness of the climate, and the cheapness of most articles of subsistence enabling the laboring masses to maintain themselves comfortably on moderate earnings. We have here no long and severe winters to intermit employment, fuel costs but little, and the country is generally healthful. Real estate in the city shows a slight improvement, and building is a little more active, while orders are increasing at our foundries and machine shops.

What is Needed to Make Mining a More Perfect Success.

We see it stated by the press and often hear it said that the business of mining for gold and silver on this coast is likely to soon undergo a marked expansion; and such may be the case—it may be that this industry is destined to advance with quickened pace and spread rapidly into new regions. We think this will come to pass in the early future. But what we most need just now is the perfecting of better methods for the conduct of this business. We require to know how to carry it on properly and well rather than to multiply reduction works or extend the field of its operations. We have mines enough and in many localities mills enough, but we have not as yet succeeded in managing either with entire success. Heretofore in all large enterprises, more especially where managed by companies, failure has been the rule, success the exception; and until we shall be able to reverse this rule it can hardly be expected that capital will respond with much alacrity to our earnest appeals for further assistance.

It appals the economic mind to reflect on the money that has been lost in mining operations on this coast, and that apart from speculations in stocks. These Pacific States and Territories have been the graveyard of capital gathered from large and small investors all over the world. Thousands and tens of thousands have been impoverished, many utterly ruined through their contributions for the promotion of practical mining schemes set on foot here by all kinds of men. No class of society has escaped this tax. The poor man's savings and the rich man's wealth, the widow's mite and the miser's hoard have all been swept away into this fathomless abyss of expenditure, from which no dollar has ever been returned.

And yet in the face of these facts the miners in the interior complain and think it hard that they can no longer get money with the same facility as of old for opening up and outfitting their claims, always alleging, when reminded of these losses, that they now have properties about which there can be no mistake. Only furnish them the money and they will demonstrate their merit by producing results that will satisfy every one concerned. But this is exactly what has always been said. When this multitudinous array of investors adventured their means before, it was upon just such representations as these. There were the assurances of "the honest miner," the opinions of promoters, the returns of assayers and the reports of experts, all vouching for the richness and abundance of the ores, the favorable surroundings of the property and the large profits that must inevitably accrue from the proffered investment. Just as now, it was all right at the beginning, but, with the exception of the favored few, proved to be all wrong in the end.

The miner should remember these things; should bear in mind how hard investors have fared and not longer expect that he can dispose of claims for a good price or obtain aid for opening and equipping them without having first made such a showing of ore as will insure success beyond a reasonable contingency. If the value of his claim is merely prospective, parties furnishing means for its development may rightly exact an interest proportioned to the risk they run. Not a few are the instances where claim owners have, through persevering hard work, brought their properties into a self-sustaining condition, though aiming in the first instance to merely so develop them that moneyed men would be willing to take hold and help them through. These are examples that commend themselves to the attention of miners everywhere.

The owners of the Hackberry mine, in Arizona, have, under extremely adverse circumstances, worked that into a most valuable property, without any outside aid whatever. Simeon Wenban who, 14 years ago entered the Cortez district, Central Nevada, a very poor man, by sticking to it when all others left, enjoys now a daily net income of \$500. William Raymond went into the same region bare handed only a couple of years since, and, taking hold of a mine in a desert and nearly abandoned district, through good management, but without any pecuniary assistance from others, is once more a rich man. In the same vicinity are two or three other small companies, who, under nearly like conditions, are deriving handsome returns from ledges that years ago have been abandoned. But these were plucky men and hard workers. They did not run about looking for a big thing in sight, but started in on what seemed a fair prospect and then went ahead, without waiting for capital, or coming to San Francisco to incorporate a company and sell stock. While getting a start they not only worked hard, but managed closely and lived poorly, a course that every miner at the outset should be willing to adopt. Some of these successful men commenced with an arastra, then got in a five-stamp mill, which was afterwards increased to one of larger capacity. Others for a while at first selected their best ores and shipped them to market, putting up reduction works when they had, from the sale of their ores, realized enough money for that purpose, one of the lessons here inculcated being that the miner should be willing to commence operations on a small scale, extending the same only as his net earnings enable him to do so. A great fault

with, our miners is their eagerness to make a fortune at once—to take out a great deal of money before laying a proper foundation for doing so. If they will learn to repress this desire, cultivate patience, work hard and practice economy, they will sooner, as well as more surely, reach the end for which they are striving.

New Almaden and Guadalupe.

We had the pleasure of a short trip to New Almaden and Guadalupe, last week, and were glad to learn at the latter place that there have been some improvements there since our last visit. Of these, the Superintendent, the genial Mr. Thayer, promises us an account when they are completed. Work has been going on slowly but steadily at this mine, despite the bad state of the quicksilver market.

At Almaden we were pleased to see that the immense *tierra* furnace, for which the ground was broken a year ago, is almost completed. In fact, as we stood upon the top of it, there seemed but little left to do beside making the connection with the condensers. The furnace is a noble square prism, nearly 40 feet high. It is iron-clad throughout and is a fine piece of work.

In fact, we must admit that the furnaces at New Almaden are as well adapted to their purpose as furnaces can be. We think it would be very hard to suggest any improvement in the combination of apparatus used at this mine for the reduction of cinnabar. The furnaces work continuously. The ore leaves the furnace not only free from quicksilver, as we have proved by a careful chemical analysis, but as cool almost as it entered it. This secures an almost perfect utilization of the heat. In the next place the ore is charged and discharged and also moves through the furnace entirely by gravity. The arrangements for charging are such that there is no escape of the poisonous vapors of quicksilver. The iron coating which surrounds the furnace renders any such escape from its walls also simply impossible. Fine ore can be roasted as well as coarse. And, in fact, the whole arrangement is one of the best adaptations of scientific principles that we have seen on this coast, and speaks volumes for the intelligent management of the mine. Mr. Randal has promised us a description of the apparatus, and we hope to give the readers of the Press (at an early day) some further idea of one of the great improvements in metallurgy originating on this coast.

We noticed with pleasure some improvements in the offices both at the Hacienda and on Mine hill, and were glad to see things in such fine order. We understand there have been some improvements in their hoisting machinery at the mines, but we did not have time to examine these.

We hope to see the day when the arrangements for condensing quicksilver fumes shall be as simple and as effective as the means for producing them are at New Almaden. We do not think as do many others that the amount of quicksilver lost from the condensers is very great. Not only does an examination of the smoke and soot from the end flue of the Idria furnace in Austria seem to disprove this, but our own experiments seem to tend in the same direction. Last summer we had prepared some squares of gold foil. These were first exposed to the fumes of some of the condensers where quicksilver was depositing its vapors, in order to test their sensitiveness and they were instantly coated. Similar ones were then exposed for nearly a week (at the end of the apparatus), so that the escaping fumes might impinge upon them. There was not the slightest trace of amalgamation. These experiments would be decisive were it not for the presence of a certain amount of soot in the fumes. This may have formed an imperceptible film so as to protect the gold from the very dilute vapor.

It is not to their ineffectiveness, therefore, that we object, but to their cumbrous size, cost, etc. Mr. Thayer states that it took 6,000 flasks to saturate the walls of the old condensers at the Guadalupe before a single drop could be obtained from them. Rating quicksilver at 40 cents per pound, a flask of 75 pounds is worth \$30, and this makes \$180,000 worth of quicksilver which must remain as so much dead capital until these same condensers are pulled down.

Much has been done, in this direction, in devising improvements in New Almaden. In fact, their iron condenser and the condenser of wood and glass have done much to do away with the unwieldy and costly things of brick. But in this direction, difficult as it is, we believe there are possibilities for improvement, and we hope to be able to suggest some ideas on this subject at a future time.

SILVER TO BE A LEGAL TENDER IN SUMS OF TWENTY DOLLARS.—The bill passed by the House to discontinue the coinage of silver five-cent and three-cent pieces, contains a provision that may be of special advantage to the Pacific Coast, namely: "The present fractional or subsidiary silver coins shall hereafter be a legal tender in all sums not exceeding \$20 in full payment, and shall be taken up and legal tenders given in exchange for them when presented at the Treasury of the United States in sums of \$20 or over." It is presumed that this will authorize the exchange of greenbacks for subsidiary coin at the San Francisco Sub-Treasury; but if not, the clause can doubtless readily be amended in the Senate so as clearly to effect that desirable purpose.

Notices of Recent Patents.

Among the Patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

ROPE TRAMWAY.—Thos. H. Day, S. F. Mr. Day's invention relates to certain improvements in the construction of wire-rope tramways and apparatus. It consists in a novel construction of the tube within which the rope runs beneath the permanent way, so that it may be laid without cutting the cross-ties or sleepers, made much smaller than heretofore and very much more cheaply. It also consists in a means of detaching the grip from the rope and throwing it entirely out of the tube, so that the car may be made to cross another wire ropeway at any angle, or may be switched off upon a siding or transferred to another line of track at any point without the necessity of going to the full length of the line or to any special point on the line, where there is a turn-table or other apparatus for transferring the car or dummy. The peculiar apparatus employed for the purpose of making the connection between the car and rope and throwing the grip entirely out of the tube makes it possible for the inventor to run a line of cars in both directions with but a single line of track, and neither car, grip or any portion of the apparatus need be reversed in any manner.

SIDEWALK HATCHWAY.—Peter H. Jackson, S. F. This invention relates to certain improvements in that class of doors which are employed to close openings in sidewalks and other places where it is desired to have a door which shall be perfectly water-tight when closed and also level and flush, without any external projection, and it consists in a novel construction of hinges and also in the employment, in combination with the doors and frame, of a series of grooves or gutters, so placed as to catch any water which may enter through the joints around the outside or meeting edges and convey it off without allowing it to fall into the area or space below. It also consists in combining with the doors and their meeting edges of a combined bearing bar and gutter, said gutter being connected with those at the sides, so as to convey off all the water which may come in from any direction.

CONSTRUCTING WOOD SEWERS.—A. Herrmann and W. Sexton, San Jose. This covers an improved construction for wooden sewers and drains of all descriptions and consists in a novel method of forming and uniting boards, planks or timbers at right angles with the axis of the sewer, so as to bind them together in any desired shape to resist external and internal pressure, and so that any portion of it may be repaired from the interior without disturbing the surface of the street above. It is claimed that the method employed is a novel, cheap way to imitate the egg and circular shape of brick sewers without an elaborate frame with and without the help of either nails or iron, bolts, screws or hands; and that the pressure of the surrounding ground instead of weakening the structure makes it stronger and less liable to get out of order.

When He Was a Miner.

In his great speech on the silver bill, Senator Jones pronounced a glowing but well-deserved paucy upon the miners of this coast, declaring that he himself belonged to that class, having for years labored with the pick and shovel for a livelihood. It is a common practice with aspirants to public favor, this of proclaiming themselves laboring men for the sake of gaining popularity with the masses, some having recourse to it who have never performed a day of manual toil in their lives. With Jones, however, the claim is a well-founded one, he having been not only a practical miner, but having, at least on one occasion, worked for wages, as the following story, related by an eye-witness, tends to establish.

Jones, who came to California at an early day, after mining for two or three years in Tuolumne county, pulled up stakes and put out on a long tramp to the north, fetching up in Weaver Basin, Trinity county, his eschequer so depleted that he was obliged at once to find something to do. In this straight he hired out by the day to a Pike county bull puncher, who was running a string of sluices on Weaver creek. This Pike was a sour, grumpy sort of fellow, but our miner, thinking the alkali absorbed in crossing the plains might have counteracted the natural acerbity of his temper, was disposed to treat him with affability, extending to him, on all occasions, the common amenities of life.

After this had gone on for a short time, he, of the butternut jeans, determined to check what seemed to him such undue familiarities from an underling; wherefore, the future Senator, ceasing work for a moment and leaning on his shovel, as was his wont, bade him a cheery "good-morning," his employer, scowling, growled out, "look at here, young man, did I employ you to shovel dirt into that yar sluice or to stand thar on one leg and pass the compliments of the day with the boss?" According to the tradition, the relation of master and servant was the same evening severed between these parties.

The Manufacture of Dynamite, or Giant Powder in England.

A decision has recently been rendered in the English Supreme Court of Judicature, in the case of The British Dynamite Company vs. Messrs. Krebs & Co.

This was a suit originally brought by the plaintiff company against the defendants, Messrs. Krebs Brothers & Co., of Cologne (who are manufacturers of the explosive compound lithofracture), and against their agents in England, for an infringement of the patent in this country. The patent on which the plaintiffs relied, and which they complained was being infringed by the manufacture and sale of lithofracture, was taken out in 1867. The cause was heard before Mr. Justice Fry in June last year, when his Lordship held that the defendants had to some extent made use of the plaintiffs' invention, and that the plaintiffs were, therefore, entitled to an injunction, with an account of the profits.

On the appeal, the Attorney-General, Mr. Macrory, and Mr. Fielding Nalder appeared for the appellants, and Mr. Aston, Q. C., Mr. E. Cutler, and Mr. Chester for the Dynamite Company. The Attorney-General opened the proceedings on behalf of Messrs. Krebs & Co., praying a reversal of the judgment of the Court below, on the grounds that the instructions contained in the patent of 1867 were insufficient, and that the claim was too wide; that it was, in fact, what is known as a roving patent.

Mr. Aston then proceeded to argue the case for the Dynamite Company. At the conclusion of the learned counsel's arguments on the second day of the hearing, the Master of the Rolls, without calling on the Attorney-General to reply, said, that although, on the one hand, a Judge must not be astute to defeat a patent, yet, on the other, he must not extend a patent so as to cover that which was not then discovered. The question here was whether the alleged discovery was reduced to that form and described in such terms that a competent workman taking the specification into his hands would be able to manufacture the article, the subject of the patent, without any experiment. In his opinion in all these respects the specification failed in complying with the necessary conditions, the instructions were insufficient, and the claim was too wide, and he thought the order of the Court below should be discharged, and the bill dismissed with costs.

Lord Justices James and Thesiger concurred. They thought that on both points the judgment of the Court was wrong, and the appeal must be allowed.

An Assay Outfit for One Hundred Dollars.

We are constantly in receipt of numerous inquiries as to the amount of apparatus necessary to fit up a small assay establishment from miners and others in remote parts who wish to be able to know something about the contents of our ores, and we have made some investigations in this direction for the benefit of such of our readers as may need such information.

Messrs. John Taylor & Co., of 512 and 518 Washington street have been kind enough to give us a list of apparatus and chemicals which will be sufficient to make all the assays of gold, silver, and lead, which they say can be furnished for \$100. The list is as follows:

1 assay balance, with weights from 10 to 1-100 grains. Gramme sets will be supplied if desired. 1 pulp scale, with weights from one ounce Troy to one grain. 1 10-inch furnace, iron lined with fire-brick. 1 muffle. 1 pair crucible tongs. 1 pair scorifier tongs. 1 pair cupel tongs. 1 cupel mold. 1 assay mold. 1 quadruple ingot mold. 1 dozen assay crucibles. 1 dozen scorifiers. One-quarter dozen crucible corers. 1 one-half gallon iron mortar and pestle. One-half dozen annealing cups. 1 Nest (16) porcelain evaporating dishes. 1 dozen test-tubes. 1 rack for test-tubes. 1 dozen matrasses. 1 glass spirit lamp and wicking. 1 brass blow-pipe. 1 nest (4) beakers. 1 wash bottle with handle. 1 four-inch glass funnel. 1 brass sieve, No. 60. One-half dozen assorted test papers. 1 package filters. 1 four-inch steel spatula. 1 wire tripod. 1 steel hammer. 1 polished anvil. 1 pair flat pliers. 1 pound chem. pure nitric acid. 1 pound chem. pure sulphuric acid. 1 pound chem. pure muriatic acid. 10 pounds bi-carbonate soda. 5 pounds litharge. 10 pounds bone ash. 5 pounds borax. 2 pounds refined niter. 1 pound carbonate potassa. 1 pound fused cyanide potassa. 1 pound sulphuret of iron. 5 pounds bar lead, pure. 1 pound FFF ammonia. 1 pound black flux. One-half ounce proof silver. 1 pound pure granulated lead. 1 pound pure rolled lead.

This outfit we are confident would enable many a miner and prospector with a little experience to do much of his own assaying, especially in such remote places as make it difficult to have it done by competent parties except by waiting for some time. And at any rate we hope the information will not come amiss, and we hope at some future time to give our readers some further information as to the state of our chemical manufacturing and importing industries, that they may know where to go for what they want.

The opium smoking vice has got a firm foothold in Sutter Creek, Amador county.

Thomas Edison and the Phonograph.

We take occasion in this week's PRESS to inform our readers of the recent advances which have been made in the mechanical transmission and recording of vocal sounds. In our issue of last week we gave an account of the development of the telephone. Our task at this moment is to describe a still more startling achievement of genius, and that is a successful record and reproduction of human speech by a simple machine called the phonograph. We shall speak first of the man who has accomplished the achievement, and second of the machine itself.

In 1847 Thomas Edison was born in Ohio.

THOMAS EDISON—Inventor of Telephone and Phonograph.

When he was eight years of age his parents moved to Michigan, and young Edison began life as a newsboy. He was a driving newsboy. At 13 years of age he obtained a contract for the exclusive sale of newspapers on one of the largest Canadian railways, and had a squad of boys working under him. While he was still running on the trains he began chemical stud-

and reproducing the human voice and won a world-wide fame.

The phonograph is regarded as the greatest triumph of inventive genius which has been attained even in this inventive age. It is greatest in its achievement and peerless in its simplicity. The engraving on this page shows all its parts, and from these it appears that there is nothing intricate in its mechanism. It consists, as shown in Fig. 1, of a brass spirally-grooved cylinder, *A*, mounted on a long, horizontal screw, the cylinder being rotated and at the same time moved laterally by turning a crank at the end of its shaft. The chief part of the apparatus is the diaphragm, marked *B*, in Fig. 1, and shown in detail of its parts in Fig. 2. At *C* is shown the thin plate of metal held by its edges, so that it can vibrate, and at *D* is a fine needle or stylus, which is attached to the

THE PHONOGRAPH WITH SECTIONAL VIEW OF DIAPHRAGM.

ies, fitting up a traveling laboratory to take with him on the cars. Then he became a telegraph operator, and soon afterwards stood at the head of the craft. He celebrated his 20th year by conceiving the idea of sending two messages over the same wire at the same time, thus doubling the capacity of all previous systems of telegraphy. For the last ten years he has pursued his electrical studies and inventions, working with surprising swiftness and exceeding zeal, until at length he has succeeded in recording

instrument. When this has been properly done, the stylus, *D*, should lightly press against that part of the foil over the groove. The crank is now turned, while, at the same time, some one speaks into the mouth-piece of the instrument, which will cause the diaphragm to vibrate, and as the vibrations of the latter correspond with the movements of the air producing them, the soft and yielding foil will become marked along the line of the groove by a series of indentations of different depths (Fig. 3),

varying with the amplitude of the vibrations of the diaphragm; or, in other words, with the inflections or modulations of the speaker's voice. These inflections may therefore be looked upon as a sort of visible speech, which, in fact, they really are. If now the diaphragm is removed, by loosening the clamp, and the cylinder then turned back to the starting point, we have only to replace the diaphragm and turn in the same direction as at first, to hear repeated all that has been spoken into the mouth-piece of the apparatus; the stylus, by this means, being caused to traverse its former path, and consequently, rising and falling with the depressions in the foil, its motion is communicated to the diaphragm, and thence through the intervening air to the ear, where the sensation of sound is produced.

The method in which the stylus indents the tin-foil is shown in magnified form in Fig. 3, *A* being the stylus and *B* the cross section of the tin-foil. In reality the marks left by the stylus are very fine. As the sheet of tin-foil is taken from the cylinder it is grooved with parallel grooves about 14 to the inch. In each groove there are the indentations of the stylus, quite regular in size to the naked eye and about 50 of them to the inch.

The Phonograph at the Grand Musical Festival.

The phonograph admits of many applications. The tin-foil sheet having recorded speech in one place may be taken from the cylinder and sent thousands of miles, and being placed in another phonograph will reproduce the words and actual tone of voice originally imparted to it. This will probably be fully shown at the coming Musical Festival in this city. For some time past Manager Bugbee has been endeavoring to secure a phonograph for the purpose of giving a public exhibition of its wonderful performances at the first day of the Festival. Samuel Hubbard, the agent in this city, has received a dispatch stating that the phonograph will be promptly forwarded—also the tin-foil impressions of warblings by Miss Kellogg, Miss Cary or Rudersoff and a greeting from Rev. Henry Ward Beecher, for the purpose of reproducing them through the aid of the phonograph at the Festival. Carl Zerrahn, the director, brought with him tin-foil impression of "Yankee Doodle."

In an article in the *North American Review* Mr. Edison indicates what are its probable applications. We may expect before a year is ended to have it ready for use in correspondence. The principle can be applied to every implement or toy which makes a sound. A clock may speak the hours, instead of striking them. A child's doll next Christmas day may utter the moral precepts which we put in our children's copy-books. The locomotive approaching a crossing may screech out: "Look out for the engine!" or it may cry out the name of the station it is approaching, because Mr. Edison believes he can intensify sounds as well as reproduce them as they are committed to the instrument. He says that he can in time make the machine talk so loudly that it can be used on vessels to warn off other ships during fogs, and his last astonishing proposal is that he shall construct a huge phonograph to go in the great bronze statue of Liberty which is to be erected in New York harbor, so that the metal giant can make a speech audible over the entire bay. In view of what Mr. Edison has already accomplished, his success in this respect would not surprise us.

THE TELEPHONE IN OUR OFFICE.—We propose to avail ourselves of the advantages of the inventive triumphs which we describe in this issue. We shall soon have telephonic communication between our business office and our editorial and composing rooms, which are a number of blocks distant from each other. Any reader who may desire to inspect the actual working of the instrument, is welcome to come and try it for himself. The telephone will afford us momentary speaking connection with 100 or more of the leading business-firms in this city through the "central system," which we described last week. We have confidence that this "central system" established by the American District Telegraph Co., at their office No. 222 Sansome street, will prove an important step in the advancement of the city's business interests, and will also result in increasing the usefulness of the PRESS to its patrons.

PLACING OUR LOAN.—The Syndicate has decided to take the remaining 15,000,000 of the 50,000,000 of 4½% bonds covered by its contract with the Secretary of the Treasury. The options for October, November and December are thus anticipated. A large part of the 15,000,000 will be sold abroad. It is asserted that the Syndicate is discussing the question of entering into a contract with Secretary Sherman for 50,000,000 4% bonds, with the option of taking 50,000,000 more.

DISBANDING OF THE DIO LEWIS PARTY.—According to intelligence from San Jose, the Dio Lewis camping party will disband. Two small parties proceed to the Yosemite. Others return to their homes. The doctor's sickness is most unfortunate, as he has lost money on the enterprise. His agents show every disposition to accord justice to all.

THE rock in the bottom of the Combination shaft at Virginia City is growing softer, and the water is fast increasing. They are now hoisting 36,400 gallons per day, whereas, until recently, the quantity hoisted was but about 16,000 gallons per day.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our now community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

DEWEY & CO.,
Patent Solicitors.
No. 202 Sansome St., S. F.

From A Patentee.

HUNSAKER, TULARE CO., CAL., Jan. 15, 1878.
You will now receive my grateful, heartfelt thanks for the able manner in which you have conducted the interest intrusted to you by me. Your acknowledged ability, confirmed to me as it is by the successful presentation of my claim for a patent on a pump power, not only delights me, but suggests the propriety of my continued patronage and that of all my friends. With kind wishes for your future success, I subscribe myself, yours respectfully,
A. L. HUNSAKER.
Messrs. Dewey & Co., Patent Solicitors, S. F.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and subscribers against the acts and mistakes of others.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

ANY person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

The Mining & Scientific Press,

Is the leading mining journal in America, and it enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, postage prepaid, \$4 a year in advance. Sample copies, post paid, ten cents.

DEWEY & CO. Publishers, S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
A. C. KNOX—Pacific Coast.
C. K. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMPTION—Tulare, Fresno and Inyo counties.

WM. M. BREWER—Black Hills, Dakota Territory.
RICHARD ALLEN—British Columbia.
R. D. NUNNALLY—Siskiyou County, Cal.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates. Send stamp for our circular and samples.

GOOD LAND

— IN A —

FAVORABLE LOCATION,

GUARANTEEING

Sure Crops Every Year.

The Reading Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends some 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is very healthful and comparatively desirable. The near proximity of high mountain peaks give cool nights during the "heated terms" which occur in our California summers.

Soft well water—remarkably sweet, pure and healthy—is obtainable at a depth of from 15 to 35 feet.

Wood is plentiful and easy to get.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,

Anderson, Shasta Co., Cal.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 13, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachapass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabazas, in the valley of Santa Cruz; Coronacion Peak, the Arivae Valley and the ruins of Casa Grande.

Also, numerous other engravings of ruins and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Oatman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Beck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA, Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

PAYOT, UPHAM & CO.,

Publishers and Wholesale Stationers, 204 Sansome Street, San Francisco, Cal.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
 One man, per day.....\$ 3 50
 One man, per day.....3 00
 Wood, 1½ cords at \$3.....7 00

Cost of 20 tons.....\$13 50
 Cost of one ton.....67½

From 2½ to 5 per cent. of salt is necessary.
 In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

R. HOE & CO.'S

CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with

Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remain sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Filee are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gange.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in Mining and Scientific Press.

32 Fremont Street, San Francisco.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 20th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the Pacific Rural Press for January 26th, and also the Mining and Scientific Press. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the Press as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

25 Fashionable Cards, no two alike, with name, 10c. postpaid. OEO. I. REED & CO., Nassau, N. Y.

Continued from page 325.

TUSCARORA DISTRICT.

THE GRAND PRIZE.—*Silver State*, May 18: This company shipped west yesterday, 27 bars of bullion, valued at \$46,447. This is the largest shipment ever made at one time from the mine, and if we are correctly informed it is the last that will be made for some time. That the mine has been gutted for a purpose by the management is not doubted by those who have had opportunity to observe the manner in which it was worked. The vast deposits of rich ore above the water level were extracted to send up the stock, so that insiders could dispose of it at a handsome figure, and no effort was made to prospect the mine below water level until those ore bodies were exhausted, to enable the insiders to buy back their stock at one-eighth of the price they sold it for. It is putting it mildly to call those responsible for this state of affairs swindlers. It is crookedness of this kind practiced by Directors and Superintendents, who form a ring to cheat stockholders, that brings mining into disrepute and causes the business to be classed with gambling.

WARD DISTRICT.

PAYMASTER.—*Reflex*, May 18: Judging from what we saw lately in the clay chamber of this mine it is not excelled by more than one mine in the State. From side to side it is all of 60 feet wide, possibly more, but how far it may extend along the lode no one pretends to know. From the level of the tunnel this body of ore has been raised upon almost to the grass roots. The entire mass it is thought will average \$75 a ton, and a large percentage will go from \$300 to \$500 to the ton. It is claimed that the greater portion of this ore can be milled to advantage, which we can readily believe on account of the presence of antimony. There are those who still propound the question: "does this body of ore go down?" We suppose it does.

MUNCY CREEK MINE.—Ned Brannan has opened up a ledge on Muncy creek that promises great returns upon further development. His work thus far has been done on the surface, but a shaft is now being sunk on the ledge. As we have said before, it is expected the ledge will prove 60 feet thick. It has already been opened up to a width of over 30 feet, on the surface it shows much more. Mr. Brannan could now supply, he says, a 20-stamp mill with ore, from which he has had assays all the way from \$60 to \$1,300 to the ton.

Arizona.

THE PIMA COUNTRY.—*Sentinel*, May 18: The news from this section of the Territory is encouraging. There is great activity in mining matters, and the country is full of prospectors and of parties operating for men of money. Cattle and sheep have done so very well for so many seasons in succession, that stock-ranges are being rapidly occupied. Farming is stimulated by the mining developments. Increasing prosperity and peace in Sonora are swelling the trade of Pima merchants. Mills and machinery have already been contracted for, and will soon be taken out there. Public confidence in security against Indians is completely restored, and the country is so rapidly settling up that renewal of Apache hostilities will soon be impossible.

MINERAL HILL.—*Citizen*, May 10: This camp, situated in Globe district, though recently settled is one of great promise. Milner and Watson got from the Silver Era and Etna mines 13 tons of ore which gave them 6,700 ounces of silver. They have increased their gang of men and have secured as superintendent Mr. Palmer, a thoroughly competent man. The Etna is about 20 feet deep and shows a body of chloride ore three feet wide. The Silver Era has over two feet of ledge matter and is richer than the Etna. At three feet from the surface the Julius shows a four-inch streak of ore; at 20 feet, the present depth, it shows nearly four feet. In is a chloride ore with a liberal showing of ruby and virgin silver. I was there the other day just as a blast went off, and masses of ore weighing over 200 pounds were thrown out. They have over 12 tons of ore out, which will average considerably over \$100 to the ton. That is the product of 30 days labor for one man. The Green Tree mine, the Mayflower, the Kanuck, Whalen's, Marco's, and all the mines and prospects along the hill to Bixby's are showing well and will soon take rank with the best of them.

Colorado.

THE MELVINA.—*Sunshine Courier*, May 11: Henry Nelkirk received a check last night for \$6,797.46, that being the amount paid by the Boston & Colorado Smelting company for 16 tons of ore obtained from the Melvina mine of Boulder county in the month of April. The profits for the month were over \$6,000, or about 80 per cent. The shaft is now 330 feet deep and the mine is supplied with steam hoisting works. Nine men are employed below and one at the engine and mouth of the shaft. The yield of the Melvina for the first four months of 1878 was 60½ tons selling for \$31,830.46, with a net profit of over \$24,000. The assay value of the ore for the four months exceeded \$35,000, and in the 34 months since the mine was first opened \$175,000. A few tons were concentrations.

Dakota.

DEADWOOD.—*Times*, May 4: The way things look now, Deadwood will soon be in the very heart of the mining district of this section of the Hills. Nearly all the rich leads and pay

streaks struck this spring, are located immediately southeast and northwest of this city.

ELIZABETHTOWN.—This place is bound to make a good camp yet. New placer and quartz mines are being discovered all around it. Some good claims have just been opened, we are informed, up Spring creek, a small stream which puts into that camp from the west.

PROSPECTING AND ASSAYING.—Assayer Davis informs us that a large number of specimens of quartz are being brought in to be assayed. These specimens come from all parts of the Hills, showing that the work of prospecting is being carried on to a much greater extent than the average citizen has any idea of. Much of the rock betrays big prospects.

News in Brief.

The rains have materially damaged crops in Florida.

MINNESOTA proposes to sow 6,000 acres of sorghum this year.

JOE COBURN, the pugilist, is laying brick in the prison at Auburn, N. Y.

MANY complaints are being made against the opium-smoking dens in Virginia City.

A FIFTY-THREE pound salmon has been caught in Monterey bay, with a hook and line.

THE Oakland and Bantas railroad is nearly completed, and will soon be open for business.

OAKLEY HALL'S legal practice is now confined to the Police courts.

TEN THOUSAND orange trees have been planted in the vicinity of San Jose this spring.

TENNESSEE has twice as many acres in wheat as she had last year.

MANY complaints are being made in Virginia City against the opium-smoking dens.

THE revival among the colored folks of Richmond, Va., is still in full blast.

LARGE quantities of live stock are daily arriving in the mountains from their winter quarters in the lower valleys.

JOHN DIMON has been committed to the Napa Insane Asylum. He is 55 years of age, a native of Ireland, and a tailor by trade.

LEVI WURTZ, who resided on Plumb creek, Colorado, was struck dead by lightning last week.

BAKER & HAMILTON'S extensive plow factory, at San Leandro, gives employment to about 100 white men.

JAMES G. FAIR, of the Bonanza firm, has bought, for \$5,000, Toby Rosenthal's painting, "The Seminary Alarmed."

THE Manchester operatives have consented to a 10% reduction of wages, the cotton masters will reopen their mills immediately.

GENERAL FREMONT is now very poor, his household goods having lately been sold by the sheriff.

THE triplets born in this city in February last are still alive, but do not seem to be growing very vigorously.

AT Wasatch Station, Utah, a train ran into a hand-car containing four men, instantly killing James King, the section foreman.

NINE boys at the Los Angeles high school have been suspended for smoking within the grounds.

SHEEP growers in Colorado have fixed the maximum price of sheep shearing at six cents a head.

DON RAFAEL CASTRO, a pioneer, died at Aptos, May 14th, aged 78 years. In 1838 he was Alcalde of Santa Cruz.

A HEAVY frost throughout Wisconsin, Ohio, Iowa and Indiana has seriously damaged fruit, vegetables, etc.

CHINAMEN, to the number of about 200, are working small vegetable farms in the vicinity of Melrose, San Leandro and Haywards.

"HAPPY JACK" is in the County Jail, serving out a term of three months for violating the saloon ordinance.

A VEIN of coal has been discovered about 10 miles west of Napa, which promises to turn out well.

A SCHOONER is being loaded at Santa Monica with 300 tons of asphaltum, taken from the Brea rancho, and intended for San Francisco.

A METHODIST Conference in Connecticut has decided to admit no more ministers who use tobacco.

MORRISSEY'S last political campaign is said to have cost him \$40,000. It really cost him his life.

CLEAR LAKE is reported as fairly alive with black fish, which are killed by hundreds every day.

THE fossilized fragment of a thigh bone of monstrous size has just been dug up near Santa Rosa.

Good harvest hands are in demand in the farming districts of the State at from \$30 to \$40 per month with board.

At the Merced woolen mills the machinery is in place and in successful operation, manufacturing blankets and other goods.

C. C. MILTON, of Cottoneva, Mendocino county, was drowned a few days ago while working on the chute at that point.

At Fall River, Massachusetts, last week, 20,000 mill operatives marched in procession. One of the banners carried bore this inscription: "If cheap labor be the basis of all prosperity, why is China not the head of civilization?"

JOHN H. BURKE has brought a suit in the Twelfth District Court in this city, against the Bonanza firm, and the directors of the Con. Virginia Mining Company, to recover in equity, the sum of \$35,000,000, alleged to have been withheld and misappropriated by them as the agents of the company.

Six men were killed by an explosion of gas in the Sidney mines, Halifax, three days ago.

THE bill for the repression of Socialist excesses has been submitted to the German Parliament.

THE recent earthquake at Cura, Venezuela, killed 600 persons. Heavy shocks were felt at Caracas.

NEARLY 150 persons have been arrested at Warsaw, Russia, as accomplices of the Nihilist Secret Association, recently discovered.

THE infamous divorce business is being carried on in Salt Lake through the Probate Court to as great an extent as ever.

MRS. MARGARY WATSON, of this city, has obtained a judgment of \$5,000 against Frederick Powell for breach of promise of marriage.

THE dead body of Cy Dubois, a well-known horse trainer of San Jose, was found in a creek last week near Gilroy.

THE grain crop of Stanislaus county will be the largest this year of any heretofore harvested. It is estimated at between four and five million bushels.

ABOUT the middle of the week it rained heavily from two to six hours in various parts of the State, damaging the crops in some places, and benefiting them in others.

AT Martinez on the 20th inst., Louis Kamp shot Jose Rais Berryessa, a desperate character, through the heart while the latter was advancing on him in a threatening manner.

GEO. W. ABBOTT, the money-broker, who ran away with \$40,000 belonging to the Anglo-Californian Bank, has been examined by the Commissioners of Insanity.

WHILE an iron girder of the New York elevated railroad was being hoisted in position a chain gave way and the girder fell to the ground, fatally injuring two men.

HENRY BUSSE has been committed to the Napa Insane Asylum. He thought he must live 40 days without eating, on religious grounds.

SHAD are said to be plentiful in the Sacramento river, but are not caught because the salmon nets are so large as to permit of their getting through the meshes.

A HEAVY wind and rain storm passed over St. Louis on the 18th inst., doing great damage to property and badly injuring a number of persons.

THE Petaluma *Courier* says there will not be over half a crop of wheat, barley and oats in Sonoma and Napa counties, on account of the prevalence of rust.

THE Utes are fast becoming civilized. One of them bought an umbrella at Ouray, which was shortly after stolen by another member of the tribe.

PEOPLE along the Labrador coast are starving, the fisheries having failed. The flesh of dogs is eaten, and many people have already starved to death.

THE Canadians on the border are greatly excited over the threatened Fenian invasion. The militia have been supplied with arms and gone into camp.

THE *Bay City*, a side-wheel steamer, intended to run on the ferry route between this city and Alameda, was successfully launched last Saturday at the rolling mills.

FRACO FISHER, a two-year-old boy living on the Gilroy road 12 miles from San Jose, was killed by the discharge of a pistol which his 11-year-old brother was playing with.

A COMMUNISTIC society in Parkersburg, Va., has between 500 and 600 members. It is officered and drilled. The members are reticent and the meetings are secret. Other societies exist in the State.

A BRISK shower fell in Colusa county on the 19th inst., followed by thunder and lightning. In the evening of the same day there was a six-hour rain in Los Angeles, also a slight rain during the night in San Francisco.

JOSEPH DAVIS has been arrested for alleged malfeasance in connection with the affairs of the Dime Savings Bank which recently failed in Sacramento, causing a total loss to the depositors, mostly boys and girls and very poor persons.

THERE seems little disposition among the Manchester strikers to accept the 10% reduction even temporarily. The spinners declare they would accept a 5% reduction outright, and nothing more. This action will prolong the strife indefinitely.

A PASSING vessel lately picked up, 200 miles off the Brazilian coast, a man on a raft in an exhausted condition, he having been there 10 days. His companion died after being on the raft four days and was washed overboard and devoured by the sharks.

THE steamship, *California*, built for Goodall, Perkins & Co., of San Francisco, and just launched at Philadelphia, has been sold to the Russian Government for \$500,000, the builders paying this firm \$100,000 to be released from their contract, and agreeing to lay the keel of a similar ship at once. The *California* is very fast, and is to be armed by her new owner.

THE Truckee and Steamboat Springs Company of Reno, Nevada, have awarded a contract for digging a new canal to a Chinese company for \$36,000—\$500 less than the lowest white bidder. A public meeting has been called to protest against employing the "heathen Chinese."

H. R. W. CLARK, a lawyer of San Francisco, was shot on his ranch in Ignacio valley on the 19th inst., by his son Frederick Clark, by the accidental discharge of a breech-loading gun, which he was carrying in a careless manner. The shot carried away one of the son's fingers, and the father's wound is fatal.

Trial of the New Fire Steamer.

[Written for the PRESS.]

Some two years ago, when the necessity for a fire steamer for protecting the vessels and water front property was acknowledged and advocated in the city, the Press published considerable information in connection with the subject, and gave a diagram of plans of the most improved fire launch in use in the East and Europe. The plan then described was shortly afterwards awarded the premium voted by the Fire and Water Committee of the Board of Supervisors, of which Mr. Lynch was acting chairman. The necessary appropriations to build and equip the boat, although urged by the Mayor, Chief of the Fire Department and leading shipping merchants, were not made for lack of funds. The fires at the bonded warehouse, and lumber wharves adjoining the Pacific Mail docks, showed too clearly the mistake of leaving this class of property unprotected.

That which the city did not do for its own interests, the State Harbor Commissioners have done for the interest of both land and water, and the *Governor Irwin*, the first fire steamer built and equipped on the Pacific coast, is the result.

The trial of this boat on the 16th inst. proved the following facts in connection with this last achievement in engineering. The pumps, to which of course the chief attention is directed, were of the well known Hooker pattern, manufactured by W. T. Garratt & Co. They were so modified and improved on the ordinary design as to come up to the standard requisite for fire service on the water front. The dimensions are as follows: Steam cylinders 15½ inches diameter by 24-inch stroke; water cylinders nine inches diameter by two feet stroke, with gun metal lining. The test, as far as it goes, is satisfactory, but for the public use and information further tests and information desirable may be pointed out. The main point of the trial was to test the ability of the fire-boat in supplying one or two fire engines with water through 1,000 feet or more of hose, in case at any time water should give out in the vicinity of a fire and near the bay. Several tests were made, all of them of a highly successful character, proving what a valuable adjunct the fire-boat will be to the Fire Department. The first test was throwing eight streams through 1,200 feet of hose with an inch and a half nozzle. It required the full force of the boat, with the addition of about 35 men from the department, to hold these pipes while throwing the water. The streams were thrown a distance of over 200 feet. The second test was with what is known as the Siamese attachment. The eight streams were combined into four, with the attachment on each, the nozzles being one inch and three-quarters. The streams thrown by this combination were of a most powerful character. The third test was through 2,000 feet of hose, with an inch and one-quarter pipe. This stream was thrown over 400 feet. It is claimed that the boat can supply a steamer through 2,000 feet of hose; the steamer would be able, through another 1,000 feet, to throw a stream from the bay up to Kearny street. An opinion in which all agree is that the manufacturers of the pumping machinery have furnished work which is a gratification to all experts who have examined it.

It should, however, be proved by experiment the exact time required to get up steam. The draft of water should also be compared with the minimum at the wharves (under three feet at low water). Again, how long can the pumps act continuously, and what are the general facilities for taking the vessel from a state of inaction into immediate service for a lengthened period. As the jets were thrown over the waters of the bay, no accurate distance could be shown, but it would be well to determine the exact capacity by a vertical stream in connection with a building, that judgment may at once be furnished for settling its most effective position in connection with such points as it may be required to protect. Also, its ability and power, in steaming out to some of the large grain vessels, and the reach of the jets compared with the masts and decks. If the long hose of 2,000 feet were run ashore and tested by flushing the sewers south of Kearny street, it might result in some valuable suggestions on that important question, and prove the loss of force by friction in passing through the hose. It would be well to call the fire launch into action on, say one of the bonded warehouses, at low water, so that a reliable opinion might be formed on its real use and efficiency. In this manner any imperfection would be found out and not left until a fire shows by dearly bought experience what should have been done. This fire launch is among the most valuable improvements and additions made to the engineering department of the Pacific coast during 1878. Pressure and vacuum gauges attached to the air chamber, would prove valuable indicators of the duty and condition of the pumping machinery in action. As doubtless in time every harbor on this coast will see the advisability of possessing a similar protection, a further public test would give experts an opportunity to gain exact information on a subject of great general importance.—J. HEBURN, Engineer.

JOHN LARSEY, a French Canadian, 56 years old, committed suicide at Brooklyn, Alameda county. He was formerly an interpreter in the San Francisco Police Court.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING, MAY 7TH.

ROPE TRAMWAYS AND APPARATUS.—Thos. H. Day, S. F.
STEAM BOILER FURNACES.—Joseph Enright, San Jose, and John L. Heald, Vallejo, Cal.
STRAW-BURNING FURNACES.—Cofran I. Hall, Vallejo, Cal.
HEATING AND VENTILATING CHIMNEYS.—Jeremiah Brownell, S. F.
LASTS.—Joseph E. Chenette, Hillsborough, Oregon.
CONSTRUCTION OF WOODEN SEWERS.—Adolph T. Herrmann and Wm. Sexton, San Jose, Cal.
SIDEWALK HATCHWAY AND DOOR.—Peter H. Jackson, S. F.
TRACK CLEARERS.—George Royal, Truckee, Cal.

RE-ISSUES.

JOINTS FOR SHEET METAL PIPES.—Joseph Moore, S. F.
STEREOSCOPES.—Charles H. Wheeler, S. F., and James A. Bazin, of Canton, Mass.

TRADE-MARKS.

CANNED MEATS AND FISH.—J. G. Megler, Brookfield, Washington Territory.
CIGARS, CIGARETTES, SMOKING AND CHEWING TOBACCO.—J. D. Culp & Co., S. F.
INSECT-DESTROYING POWDER.—Giovanni N. Milco, Stockton, Cal.
CANNED MEAT, FISH, FRUIT AND VEGETABLES.—Fitzpatrick, Davis & Co., Fisherton, Washington Territory.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.
NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

MINING, A LEGITIMATE PURSUIT.—The frequency with which we hear the advocates of mining assert that it is a legitimate pursuit implies, of course, that there are those who maintain the converse of this proposition. If it were alleged that this business is sometimes illegitimately conducted, none would question the truth of the allegation; but it certainly sounds odd to hear one call in question the legitimacy of mining as a business. This comes from people confounding the manner in which a pursuit is sometimes carried on with the pursuit itself. But the two should be segregated in the mind as they are widely separated in fact. Mining is often perverted to speculative purposes or managed in a very unlawful way. Men also speculate in wheat, wool, meat, etc., and yet it would be absurd to seriously talk about farming, stock-raising or wool-growing being a legitimate sort of calling. They are wholly legitimate notwithstanding these abuses occupying the same industrial status as gold and silver mining. Mining for the precious and useful metals better measures a nation's advancement than any other standard. That people who have made greatest progress in these is the furthest advanced in civilization and enlightenment. Some comparatively barbarous races raise grain and cattle, but only those who have arrived at the highest development engage much in mining, which is not only a legitimate pursuit, but is the one on which all great attainments are mainly dependent.

CHROME IRON.—We understand that considerable chrome-iron is found in the mountains about here, but that nothing thus far has been done with it. Dr. Stillwagon informs us that there is now stopping in Napa City a man who has come from Scotland for the purpose of purchasing, if possible, a mine of chrome-iron; the mineral to be exported to Scotland. Any person possessing information regarding the location of lands on which the mineral is found will do well to look after the matter.

EXCESSIVE PRODUCTION.—The petroleum industry in Pennsylvania is said to be overdone. The daily production of oil is over 40,000 barrels, while the total consumption of the world is estimated at only 25,000 barrels per day. If such an excess of supply over demand should exist for any length of time, it could not fail to financially cripple all engaged in the business and prove especially disastrous to the petroleum interest on this coast.

The extensive beds of gypsum recently discovered in the mountains of Los Angeles county will prove to be very useful and valuable, as the alkali lands can be made eminently productive by the application of this neutralizer of alkali.

MAJOR HANCOCK, of the Brea ranch, is shipping a cargo of 300 tons of asphaltum to San Francisco. The schooner is being loaded at Santa Monica.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

BUENA VISTA M. Co.—May 21st. Capital stock, \$10,000,000. Directors—J. C. Van Ness, W. H. Whiteley, Clinton Givence, A. F. Williams and E. B. Clement.
BIG FLAT G. M. Co.—May 20th. Capital stock, \$10,000,000. Directors—Oscar W. La Grange, Aquilla W. Hanna, Alexander B. Barnard, Charles B. Kendall and Benjamin C. Jackson.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Modoc, May 13th, \$4,685.24; Grand Prize, 17th, \$46,100; Raymond & Ely, 12th, \$4,740; Northern Belle, 13th, \$2,205.15; Tybo Con., 13th, \$8,707.71; Justice, 17th, \$6,600; Independence, 18th, \$16,800; California, 18th, \$132,543.49; Con. Virginia, 18th, \$57,440.63; Northern Belle, 15th, \$3,257.50; Hussey, 20th, \$3,024; Tybo Con., 17th, \$12,554.63; Christy, 21st, \$5,454; Star, 21st, \$6,178; Raymond & Ely, 16th, \$3,917.84.

The new Savage steel wire cable is two and one-fourth inches in diameter, and 4,000 feet long.

Woodward's Gardens were never more attractive than at present. A fine lion and two lionesses, all young and not fully grown, have just been added. Balloon ascensions by Prof. Martin are now being made. The popularity of the gardens continues to increase. Rates of admission unchanged.

BATES' ADVERTISING AGENCY.—Mr. J. H. Bates, lately senior partner in the newspaper advertising firm of Bates & Locke, at No. 34 Park Row, having succeeded to the business of the firm, has rented and fitted up rooms in the Times building, No. 41 Park Row, New York city. Mr. Bates is one of the oldest advertising agents in New York city, having been in the business for a great many years.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento Valley. His advertisement appears from time to time in this paper.

HAND PRINTING PRESS WANTED.—Parties having a second hand Washington or other hand printing press which they wish to dispose of, will please address this office, stating price, size and condition.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco, (fourth floor).

ANY PHOTOGRAPHERS having a large Camera Box for sale will please notify "N. S." at this office.

UNITED STATES

Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Certificate of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Recorder; Mineral Certificate; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, or plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free \$2.00. Address Dewey & Co. Mining and Scientific Press, 224 Sansome St., San Francisco.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore.

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidation and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace exceeds all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examination ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

VOLUME XXXVI.
Number 22.

A Hint to Sulphur Men.

Prof. Hilgard, of the University of California, recently suggested, in the columns of the *Rural Press*, the use of bisulphide of carbon for the destruction of ground squirrels. It had been successfully used in the sewers of Paris for the extermination of rats, and from the reports we have had, it seems equally useful in its new mission. The great objection to its use is the cost. The present prices of the purified article is 40 cents a pound. The crude article imported in bulk from the nearest manufactory, St. Louis, costs 25 cents a pound. Now, it seems to us that if this remedy proves to be what it claims to be, that it would be a great saving to the farmer and a profitable thing to our owners of sulphur fields if the article were manufactured here.

For this reason we give a short account of the properties of the substance and the best way of manufacturing it. Bisulphide of carbon is, as its name indicates, composed of one atom of carbon and two of sulphur. Its formula is CS_2 . It contains 15.8% of carbon and 84.2% of sulphur. At the ordinary temperature of the air it is a clear, colorless liquid with high refractive power and an agreeable ethereal odor (when pure). It is heavier than water, its specific gravity being about 1.27 at 59° F. (15° C.) On this account it is easily kept from evaporation and loss by covering it with a layer of water. Its boiling point is variously stated as being from 104° F. to 112.4° F. (40° to 80° C.). It is volatile at the ordinary pressure and temperature, even to a greater extent than ordinary ether, and the vapor is very inflammable. Carbonic acid and sulphurous acid are formed by its combustion. Mixed with air the vapor forms an explosive mixture. Even the pure vapor is an anæsthetic as powerful as chloroform, but the crude vapor, containing many other substances, and possessing, by the way, a very disagreeable odor, is a powerful poison, especially to all the lower animals. It has also the property of dissolving large quantities of the fats, oils, rubber, wax, camphor, sulphur, phosphorus, iodine, etc. So much for a rapid review of its properties.

Its Manufacture

It is easily attempted on a small scale by the apparatus shown in Fig. 1 of the accompanying engraving. A small furnace is inclined, as in the figure, and an iron tube as a gun barrel, or a glazed porcelain tube is placed in it. The end, *b*, is fastened by a lute tightly to the adapter, *c*, and the upper end is capable of being stopped by a tight cork. This tube is filled with coarsely powdered charcoal and the furnace is put in operation. When the contents of the tube have arrived at a good red heat, a small lump of sulphur is dropped in at *a*, and the aperture is then closed. The vessel, *d*, should be partly filled with ice water and the cooler filled with ice. No rubber should be used in making connections. The gas will soon appear and condense to drops, which soon sink beneath the water. This product is the crude substance. It contains sulphur, sulphydric acid and other things in solution, which give it a very disagreeable odor. It is purified by shaking with carbonate of soda or quicklime and redistilling.

Such an apparatus is not adapted to manufacture any large quantity, and we take the following description of an apparatus better adapted to the purpose from *Dingler's Journal*, 120, 192, to which we refer for further details. See Fig. 2.

A cylinder of cast iron, *A*, six feet high, one foot in diameter and a little more than two inches thick, is taken and carefully covered within and without with a lute of clay. This rests on a massive cast-iron block, *B*, and is surrounded by masonry. The cover of the cylinder is provided with two short tubes, *E* and *E'*, in one of which a porcelain tube is fastened, which runs to within three or four inches of the bottom. It rests here upon a layer of hard coke. The remainder of the space is then filled, through *E'*, with porous charcoal, and it is thus replenished as often as necessary during the operation. At the side, at *H*, is cast a short tube, serving to conduct off the vapors of the bisulphide. This has tightly fitting to it, by

cement, a tube, *I*, which conveys the vapor to the halloon of stone ware, *J*, where it partly condenses. This runs at will into a vessel, *L*, where it sinks beneath the surface of water, until it rises to the level of the siphon tube, *M*, when it flows into the jar, *O*, and is drawn off at pleasure. The vapors which are not condensed pass off through the glazed earthenware tube, *P*, then into the worm, *Q*, and the condensed liquid out at *R* into the jar, *S*, where it is drawn off as it fills. As the substance is very volatile, a constant circulation of water must be kept up in the condenser, the cold water entering at *U* and the hot running off at *T*.

The operation proceeds in this wise: The cylinder, *A*, being full of porous charcoal, it is heated up to a good red heat and small lumps of sulphur are dropped into *E* from time to time. As the charcoal is consumed it is added

FIG. 1. SIMPLE APPARATUS FOR MAKING THE BISULPHIDE.

through *E'*, but time is given, after adding a charge, to let the charcoal become heated up to redness before more sulphur is added. This is to avoid the distillation of sulphur with the bisulphide as much as possible. The charcoal is kept in excess to avoid this also.

Such an apparatus as is here described is said to distill daily 250 pounds of the bisulphide. It is usual to work only during the day time and to leave a low fire on during the night, without any addition of sulphur. The chief item of expense would be the consumption of cylinders, as one lasts only from five to eight days, being attacked by the sulphur. A fusible sulphide of iron is formed, which, of course, destroys the vessel.

Supposing the article to bring 25 cents per pound, we should have for a production of 25

FIG. 2. APPARATUS FOR WORK ON A LARGE SCALE.

pounds, \$62.50 for a day's work, which, supposing a market, would certainly allow the price to run down to 12 cents or 15 cents per pound and still leave a marginal profit.

There are certain cautions, however, which it would be well to add. The gas is poisonous even to men when inhaled in quantities. It is very inflammable and yields, with air, an explosive mixture. The products of the combustion, carbonic acid and sulphurous acid, are also irrespirable and very suffocating, so that in case of an accidental fire, there is nothing to do but to let it burn. The vapor also, it must be remembered, is nearly three times heavier than air, and so, if allowed to escape, it easily flows into the fire and the explosion ensues. To avoid this, it is necessary to have an intelligent, trustworthy man, who will see that all joints are tight and that the condenser is kept cool. It is also well to have the fire-place separated from the condensing apparatus by a brick or iron wall.

In transporting the liquid also, care must be

taken. The vessels, if of glass, must be sufficiently thick; and, if of iron, must be tight enough to prevent leakage and the whole must be kept cool.

We would remark that for the particular use mentioned, purification is not necessary, as the crude article is cheaper and answers even better than the pure.

We have not space for any further remarks on this interesting substance at present, but hope that "a word to the wise" will be sufficient.

Since the above was written we learn that the price of the bisulphide has, owing to the increased demand, gone up to \$1 per pound.

A NEW GOLD WASHER AND AMALGAMATOR.—A model of a gold washer and amalgamator, invented by Bryan Tyson, of Washington, D.

The Eureka Process.

At No. 10 Stevenson street, in this city, R. F. L. Hallock, the inventor of the above method for the treatment of refractory ores, can be found, ready to explain the nature and advantages thereof, save, of course, the secret that constitutes its most distinctive feature. Mr. Hallock claims a long experience as a practical metallurgist, having been fighting the rebellious-ore problem ever since the summer of '52, when he first tackled it in Sierra county. He has been waging the combat with the occult forces of chemistry ever since, and feels satisfied that he has at last got the better of them. As evidence of this, he proposes to take the most stubborn ore and extract therefrom the gold and silver, within 5% or 6% of the total it contains, at a cost never to exceed \$10, and ordinarily not more than \$4 or \$5 per ton. To this end, the ore, after being reduced to the size of cherries or a little smaller, by being passed through a rock-breaker, is roasted in a furnace, not very unlike those most in use, save that the structure is conical in form, the sides approaching each other at the top. The advantages of this shape are that the heat is more concentrated or rather prevented from escaping so readily from the stack, while the slag is less likely to adhere to its inner surface. At the top of the chimney a condenser is affixed, being either in the shape of an aperture, for admitting the air, or a cone with a spray of water. The floor of the furnace is covered with ashes and is set at an angle sufficiently steep to facilitate the discharge of the roasted ore, which falls into a tank, filled with a chemical solution, that, after a short retention, oxidizes the iron, decomposes, or, at least, greatly softens the gangue, disintegrating, in fact, all the integral parts of the ore, while it so furnishes the precious metals. That the quicksilver seizes and holds them with greater readiness, the amalgamation being effected in a pan, rigged and run in a pan constructed for the purpose.

To this plan of treatment, the Meadow Lake ores, the most mulish in the country, have succumbed readily, and the inventor feels sure that he can reduce these at an expense, on the ground, not to exceed \$6 or \$8 per ton. The cost of works will, of course, vary with capacity. But a furnace with necessary appendages, capable of handling 20 tons per day, can be put up in California for about \$700, and it will even be possible to put up one of a ruder style and of less capacity, but equally effectual, for half that amount. It is proper to state, in this connection, that Mr. Hallock claims less merit for his process on the score of close working than of cheapness, the cost of his furnace as well as of operating it being extremely moderate.

Mr. A. J. BOWIE, the mining engineer, has returned from this city to the Black Hills, after having perfected his plans of operation for the California company by whom he is employed. While here Mr. Bowie arranged the plans for an 80-stamp mill, which is shortly to be erected in the Black Hills, but will be made in this city. The mill is to be first-class in every respect, and will really be a model gold mill, as that of the bonanza mines is a silver mill. All the appliances possible for effecting a saving of labor or money, will be utilized. The arrangement of the machinery is such that batteries will be placed on opposite sides of the building, everything flowing towards the center, and the whole process may be inspected and superintended by one person in the center of the building. We shall give a detailed description of this machinery when completed. Mr. Bowie's first work in returning to the Hills, will be to bring in a supply of good water, which will necessitate the construction of an extensive ditch.

THERE is excitement among the quartz miners in Amador county, California. It is reported that quartz has been discovered near Plymouth worth \$1,000 per ton. In one instance a single blast threw out a piece of rock worth \$6,000. The Empire mine returns a profit of \$14,000 a week. It has a ledge 44 feet wide and nearly a mile long, and a mill with 80 stamps.

miners would do well to examine into the subject.

A GENTLEMAN just returned from Bodie gives the *Renew Gazette* a gloomy account of matters in that region. He says the Standard is the only paying mine and that 500 men are idle in the town. The number of arrivals and departures is about the same, some 30 persons daily coming into the camp and an equal number of "husted" ones sorrowfully leaving. The work of prospecting continues principally in a southern direction from the Standard mine and along the same ridge. Several hundred claims have been located, but no one body of paying richness has been discovered.

NEW DIGGINGS IN CALAVERAS.—The discoveries in Old Woman's gulch and vicinity have created a great excitement. The whole country for a long distance is claimed by eager prospectors. There is a large amount of gravel in these claims and it is very rich and well located for hydraulic mining.—*Chronicle*.

The Late Prof. Joseph Henry.

(Remarks before the California Academy of Sciences by ROBT. E. C. STEARNS.)

Members of the Academy:—Death, which hath all seasons and conditions for its own, has just stricken from the roll of the living one of the illustrious names of the century, a name eminent in intellectual, especially scientific circles, throughout the world. I refer, of course, to the late Prof. Joseph Henry, whose long life service to his country and to mankind as an educator and scientific investigator, and as the organizer and head of the Smithsonian Institution, placed him naturally, and justly, at the front, as the representative of science and scientific thought and culture in America—a position which he filled because of his high attainments, and through the conspicuous nobility of his character, with exceeding credit to himself and to the manifest advantage of science and his country. A man of great, yet unassuming excellence, whose merit met him was at once impressed most favorably by his quiet, yet cordial greeting, his dignified, yet genial welcome. His native breadth of mind, his wide reading, correlated with and refined by an ample and generous philosophy, impelled him, even early in life, to regard not this or that direction of study or path of knowledge, only, as worthy pursuing, but that the simple text or legend should stand as an axiom resting upon the everlasting foundation of truth, that "Knowledge should be pursued for its own sake." This made him appreciative of the special study and work of others, and his friendly interest and sympathetic words stimulated and inspired the student to continued and increased effort.

I will not recite by title in long enumeration the many responsible positions he filled—the experiments, investigations and discoveries he made, or enlarge upon the numerous honors conferred upon him by the higher institutions of his own country, or repeat the tributes paid to his achievements by the highest intellectual and governmental authorities of foreign lands. Turning from those well-merited honors, acknowledgements not less of eminent ability than of his scientific integrity and personal worth, we are led to survey the completed life, in its rounded term of 80 years, as a whole, as we would view from afar, some stately tree whose lines are full of strength and beauty, and we are curious to learn what beneficent star was in the ascendant, what occult charm and power of circumstance, nurtured and protected and led him onward through the days of his youth and hazed the path for his later years. In turning to his early life, to the time when he first went forth on its now completed voyage, we find that he was not born a favorite of fortune, as that term is usually understood, meaning an environment of luxury and ease; but, if we give a higher and better definition to the phrase, we may well regard it as fortunate for him and for the world that he was born with a profound and abiding thirst, an irrepressible longing for knowledge, which determined his destiny and molded his career; which led him upward and onward, though by no royal road devoid of labor.

Had his mind been colored at all by avarice, or the desire for wealth, or, if in his earlier years it had received the impress of commercial bias through experience in trade, he might, through his numerous and important discoveries, extended into inventions, especially in electricity in its practical application, have accumulated wealth as did others of less knowledge, who reaped in this productive field. His fortune so far as regards material wealth was like that of others, of nearly all of the great, the earnest and sincere teachers and philosophers, who have labored faithfully and unselfishly for the cause, seeking with a single mind in all its strength only for the increase and diffusion of knowledge among men.

During the official term of President Fillmore, in addition to his other numerous duties, he was appointed to the light-house board, a most important service, and his visit to this coast, which occurred a few years ago (September, 1871), was in connection with his position, and his presence at the Academy on one occasion, during said visit, will long be remembered by those who were present at the time.

His life is ended, but his memory will be cherished by all who knew him, and like the usefulness of his labors, shall endure for years. His career constitutes a monument marking the advancement of human thought and the intellectual progress of the republic in which he was so eminent a citizen.

SODA MAKING IN NEVADA.—The owners of Soda lake, a short distance above Ragtown, have commenced operations for the season. They manufacture about 300 tons of soda each summer. The crude soda is worth about \$50 per ton in San Francisco. In making it the water of the lake is pumped out upon a convenient flat, where it is evaporated, as is salt water in the manufacture of salt. The crude article is taken to Wadsworth on wagons, and from there is sent to San Francisco.

REGULATING IMMIGRATION.—Senator Sargent, has introduced in the Senate, making it unlawful to bring within the jurisdiction of the United States any paupers, lunatics or criminals—not including political convicts—or any involuntary emigrant under a labor contract, etc., and authorizing the various States to enact laws for the exclusion of such persons from their respective limits.

Porphyry and the Use of the Magnifier in Determination of Rocks.

At the meeting of the San Francisco Microscopical Society on May 16th, a paper was read from Mr. Melville Attwood, F. G. S., concerning porphyry and the use of the magnifier to the practical miner. Mr. Attwood's paper was accompanied by 22 rock specimens, illustrating a new method of preparing the same for determination, and 24 slides of sections of these rocks. The paper by Mr. Attwood we print in full, as it is of value to those engaged in the science and industry of mining:

"Porphyry."

The generally accepted meaning of the term porphyry, without addition or qualification, denotes "quartz porphyry," a plutonic rock, with a compact matrix or ground mass, consisting of quartz and feldspar, with distinct crystals of both, having a specific gravity of from 2.5 to 2.6 and containing from 75% to 85% of silica.

What rock the Comstock miners mean when they say porphyry it would be exceedingly difficult for any one to tell. In reading over the published reports of the different Superintendents, they appear to be continually meeting with it in all depths and to the east and west of the different bodies, also in the shape of "horse," or dead ground, mixed with the vein matter, and called "bird's-eye porphyry." Now, in 99 cases out of 100, what they call porphyry does not in any one respect resemble that rock, la king by 25% the required amount of silica and having no free quartz. A very slight examination by any one having only a rudimentary knowledge of geology would show that the term porphyry, so applied, is the most inappropriate that could be used to describe either the west or east country rock of the Virginia portion of the great Comstock lode. The only way I can account for the use of that term, is that they prefer it to saying "country rock."

I hardly think it requires me to say how desirable it would be, indeed, necessary, for those conducting explorations and trials on the Comstock range, to know and be able to distinguish the different rocks they meet with in their operations, particularly as those rocks enclose some of the richest mines yet discovered in the world, and since the cost of those very explorations amounts annually to millions and millions of dollars.

It may be urged that the geological maps of the exploration of the 40th parallel contain most of the necessary information. I would recommend those who think so to examine the maps, or any of the cross-sections of the workings on the Comstock, beautifully drawn, I believe the work of Mr. Stretch, but colored by the officers of the survey, and they will find that the Mount Davidson diorite is colored as syenite, and the black dyke, a dolerite, as andesite. Most of the country rocks overlaying the Comstock on the east are marked as porphyry and andesite. The so-called porphyry and andesite are identical in chemical and mineralogical composition, and a slight inspection of the Suto tunnel and other drainage levels will show that petrologically they are the same, in fact the only difference being that the former occurs in sheets and the latter in dykes. When the felspar in the so-called porphyry is very much kaolinized, the rock is sometimes termed by the miners bird's-eye porphyry. It may be said that the new work by Ferdinand Zirkel, *Microscopical Petrography*, corrects many of those errors, by admitting in the first place that the Mount Davidson rock is a diorite. No mention, however, or section, is given of one of the most important rocks of the Comstock range, the black dyke, and on the explanation of the beautifully colored plates he has neglected to state the number of times they are magnified. This is a most unfortunate omission, particularly so with respect to the basaltic rocks. My attention was called to it by some remarks in one of the Virginia papers, wherein it was stated that one of the handsomest colored plates was a section of basalt from American flat. Now, dolerite, anesite and basalt, are, in a mineralogical point of view, the same rock, differing only in the fineness of texture.

On No. 14 slide I have mounted a section from each of those rocks, so that their difference in texture may be easily distinguished.

Rock and section No. 15 is a sedimentary one, from the Hawaiian Islands—the grains of sand in it averaging 2-100 of an inch in diameter, and, as you will see, consists of coral sand, shells, fragments of basalt, and small pieces of magnetic oxide of iron—the crystals of feldspar in the grains of basalt can be seen with a common lens (and Mr. Hyde has kindly offered to measure the length of them for me.)

The following are the approximate measurements of the crystals of feldspar in these rocks:

In the black dyke they average from 7-600 to 20-600 in length by 1-1200 to 10-1200 in width.

In the dolerite, they are of irregular shape, but generally about double the size of those in the black dyke; while there are small masses containing small needle-shaped crystals 1-300 to 4-300 in length.

In the basalt, they average from 4-1200 to 9-1200 long by 1-1200 to 2-1200 in width.

Eight pages, however, in that work with a colored section, are devoted to what is called "Angite Andesite." Now, though I have taken a great deal of trouble, as yet I have not been able to procure a single specimen of that rock called andesite. A few months ago, a very

good authority on such matters, Alphons Stabel, of Dresden, passed through this city on his way home from South America, where he had been collecting rocks for many years. Knowing that he had been at Chimborazo, I thought it would be a good opportunity to get what I wanted; so when he called upon me I asked him as a favor to give me a specimen of andesite. He said that he was very sorry he could not comply with my request, that he really did not know any such rock.

I am fully aware that looseness in petrological nomenclature is the rule and not the exception, and that many geologists are found writing of totally different rocks under one and the same name. I do not think that any distinction between rocks is worth much unless it can be applied in the field. I have stated that the black dyke, a dolerite, but which from the fineness of its texture might be called anesite, was one of the most important rocks in connection with the Comstock mines, from the fact that it forms the west boundary to all the vast treasures of the Comstock, no ore worth mentioning ever having been found at the west side of it; therefore every miner conducting operations in that district ought to possess the necessary amount of knowledge to enable him to distinguish that rock. If you will look at No. 12 rock and section, you will find that it is fine-grained and apparently of so homogeneous a texture as not to admit of its constituent minerals being resolved by the naked eye. I have quite a collection of specimens which have been given to me, supposing them to be that rock.

In 1867, when engaged in the examination of the gold mines of North Wales, the well-known mining engineer, Mr. A. Dean, gave me the rough tracing of the working plans of the St. David's mine, Clogau, near Dolgelly, and which I have brought for your inspection. The geological features of that district are the Cambrian rocks, overlaid by the lower silurian. The St. David's vein is partly in the silurian slate beds, and sheets of greenstone (diabase) lying between the slates, and partly in the Cambrians. What I particularly wish to draw your attention to, however, is the transverse section, showing the gold bearing and non-gold bearing rocks of the Clogau mines, and the very important fact that only those portions of the veins were rich in gold, or productive, where the walls were greenstone.

Impressed with the truth of the discovery, on my return to California, I devoted a large portion of my time to the examination of the inclosing and wall rocks of the gold and silver-bearing veins of this coast. On the formation of this Society, I availed myself of the aid of the microscope to carry on my investigations, but soon found out that to do so with anything like satisfactory results, I must get a collection of well authenticated foreign types, to compare with and guide me in the work. Through the kindness of the late Mr. David Forbes, of London, Dr. Hector, of New Zealand, and, in this city, of Mr. H. G. Hanks and Mr. Charles Schneider, I have now a collection of some 500 specimens of foreign types, from which, with the assistance of my son, I have cut between 1,400 and 1,500 sections—some of them are very roughly done. I found it necessary to have two or three from each specimen, some cut very thin and others rather thick, to show color and for examination with the aid of the parabolic illuminator. My collection of rock sections from this coast is large; but the result of it all amounts to this. I found that every step I took I was traveling on a road that led me far away from what I wanted, which was, a method to make it easy for my fellow-miners to understand and distinguish the inclosing and wall rocks of the different lodes they were working—those rocks having so much to do with the productiveness of the lodes.

The Use of the Hand Magnifier.

By the merest chance, I have found out a simple way, which I think in a great measure will partly fill the gap so much needed.

The different pieces of rock which I now present to the Society are roughly prepared after this method, and made so that an inspection of the outer surface, viewed as an opaque object with only the aid of a common hand magnifier, will give all the information ordinarily required by the miner, and in most cases he will find that he is able to distinguish the structure and composition of the commoner rocks, so that with the help of a small collection of foreign types, prepared after the same fashion, he can compare and identify those under examination. It will be necessary for them to read up a little on the subject and to acquire a rudimentary knowledge of geology, which I think can be best done by a careful study of such works as "The Student's Manual of Geology," by J. Beete Jukes, 1857; "Text Book of Geology," by Dana; "A System of Mineralogy," by Dana; "A Treatise on Lithology," by Van Cotta; English edition by P. H. Lawrence; and "Determination of Rocks," by E. Jannettas, translated by Plympton.

The rock for examination may be prepared as follows: First wash the specimen clean, using a brush to get rid of any clay or dirt; then select the side or part you wish to examine, and grind it down on a piece of sandstone (a shoemaker's sharpening stone) until a perfectly flat surface is obtained. This will occupy but a few minutes, unless the rock is very hard. The surface should then be worked down still finer with a square emery file, using water, and after you have obtained a sufficient polish, wash the rock again, and then let it dry gradually, either on a stove, or, what is better still, a little brass table,

with a spirit lamp, the same that is used for heating slides. When perfectly dry, heat it again to a point, so that you can barely handle it; then polish the varnished side while hot with a moisture of one part of Canada balsam to three parts of alcohol, which must be warmed before applying it, and laid on with a camel's hair brush. It will soon dry, and if left for a day or two will harden, so that you can handle it without injury.

The effect of this treatment is remarkable, particularly on the lavas, as you will see by the specimen of trachyte lava from Bodie, which I now present to the Society.

In conclusion, it is with great hesitation that I have ventured to bring this matter before you, but I do so well knowing that more searching and exact methods of investigation are now demanded by those conducting large mining operations, and that such terms as porphyry, for any and all enclosing, or wall rock, that may be met with in such mines as the Comstock, and the term green chlorides, for the rich ore, will not be deemed a sufficient explanation, or tend to give the mine adventurers that confidence in the reports of their employees which they should be entitled to, particularly when it is known that the rock is not porphyry, and that the chloride of silver is one of the accidental minerals met with in the vein matter.

I am in hopes that by thus breaking the ice, others more capable in every respect than myself will be induced to communicate the results of their researches on the subject.

All that can be claimed for the mode I have suggested to you for the examination of rocks is that it is a rude and simple way of determining some of the commoner ones, but the application of the microscope, even now quite in its infancy, is after all what we must trust to for exact or reliable results.

NOTE.—The best pocket lens is "Tolle's Trip-let," but it is costly; and I would recommend a combination of three lenses, which can be purchased for about \$2.

Picket Post.

About 30 miles northeast from the town of Florence is situated the flourishing village of Picket Post. Some years ago, in Indian times, when General Stoneman was in command of the military forces in this section of Arizona, he had his headquarters at Pinal ranch, and established an outpost on Queen's creek, where is located the mill of the famous Silver King mine. It was not known in those times what a vast mine of mineral wealth slumbered beneath the ground for which the military authorities and the Indians disputed, and only a few years have passed since prospectors drew attention to the fact that the Pinal mountains were indeed a treasure house. There are those who verily believe that the Silver King is the richest silver mine in the world, while others do not esteem it more valuable than the Peck or McCrackin mine. About 15 tons of ore per day is concentrated in the mill at this place, which has five stamps and rumor says that the company clear \$50,000 per month. No work has been done on the mine for some time, as there is sufficient ore on the dump to supply the mill for a year. The capacity of the mill will be doubled. A reliable San Francisco corporation has machinery on the ground near Picket Post for a custom stamp mill, and are delayed in their operations on account of the difficulty of procuring lumber from Prescott. The corporation is known as the Pinal Mill and Mining Co., but is in no manner related to or connected with the smelting outfit of that name which victimized some of the Yavapai people and left an enduring monument of its folly. Hundreds of locations have been made in this pioneer district, and rich discoveries are constantly reported, but the development of mines is by no means rapid, owing to slow, uncertain and expensive transportation; the expense of living, and lumber at \$150 per thousand. The miners in these mountains are a hopeful, genial, cheerful set of men, having neither poverty nor riches, but an abundance of faith.

INVITED TO BRITISH COLUMBIA.—We understand that Prof. J. S. Phillips, of this city, has been urged by influential parties residing in British Columbia to remove to that Province and take up his permanent abode there. While this gentleman has, during a long residence in California, met with great appreciation here, it is possible he might find in British Columbia professionally a more inviting field. That it is less crowded is no doubt the case. Indeed, we have reason to believe there is a lack of thoroughly capable metallurgists and mining engineers in that country. However this may be, our colonial neighbors may consider themselves fortunate should they secure the services of one so well qualified to advance their growing mining interests. Prof. Phillips has had 40 years of practical and theoretical mining experience; 28 in the mines of Cornwall and 12 on this coast. He is complete master of the business in all its departments, being acquainted with both its science and its practice. He is the author of one of the most complete and useful works on metallurgy and kindred branches extant. He is an accomplished assayer, the inventor of many ingenious devices, knows how to open a mine, put up a mill and manipulate the ores. His record both as regards competence and fidelity is as good as that of any other expert on this coast, and we feel certain that he will not suffer this good record to be tarnished should his labors be transferred to another field.

MECHANICAL PROGRESS.

Bearings Without Oil.

We have already given items of the new substance called "metalline," which some experimenters expect will do away with the use of lubricants in bearings. It seems that the introduction and test of the substance is being pushed forward. Mr. Bateman, member of the Chemical Society, in a recent lecture on "Metalline," as published in *Iron*, gives the following points: "It has been found that the inherent strength of this material is not enough to carry any but light weights, therefore a solid bearing of this substance is inadmissible, but it is inserted in the ordinary brasses, being accurately drilled for the purpose—generally about ten to the square inch. The whole bearing surface is well covered by holes plugged as described, these holes being so drilled as to break joint and protect the entire brass. The protecting ends of the plugs are cut or filed off roughly. A few hours' running completes the fitting and gives a perfectly true bearing surface, the plugs, once down to the level of the brass, wearing no more. The impalpable powder of which the plugs are composed, wearing away, polishes off the asperities and points of brass and iron, the two surfaces come together, there is nothing rough to tear, catch or 'fire,' and so accurate a fit is insured as that no dust, dirt, debris or other extraneous substance can interpose itself and cause cutting of the moving and fixed parts.

"The idea is so new, so opposed to all preconceived ideas, that the natural tendency is to say, 'too good to be true.' But 'facts are stubborn things,' and next Monday morning there will be running, to my personal knowledge, in London alone: Main shafting, 3½ inches, at 150 revolutions per minute; counter shafting, 2½ inches, at 350 revolutions; lathe head (about), 1½ inches, at 2,000 revolutions; loose pulley at 450 and 700 revolutions—all having been at work from one to nine months, and never having had during that time one single drop of oil or other lubricant. In other parts of the kingdom there are main shafting five inches and calendar rolls with 10 tons and more pressure—printing machines, spinning frames, circular-saw spindles, wood-working machinery, sewing machines, cranks, bicycles, etc. On the table are samples of brasses showing the three parts of the process, drilling, fitting and paring oil; also specimens of the drills used, a pair of brasses that have been running in my own shop nine months, and a loose pulley taken down to-day for the first time after nine months' running, at 400 to 450 revolutions per minute, ten hours a day, without one drop of oil. The shaft is unaffected where this pulley has run; there are wire gauges of that part, and three inches off, showing an inappreciable difference.

"I can mention instances where, after such running as with oil, would have necessitated new brasses, these latter are positively unaffected. It is evident that should what is claimed for metalline be borne out by further experience, it cannot fail to be a most important invention. It is not likely it will entirely supersede oil in all directions; but for loose pulleys, pulley sheaves, inaccessible main shafting, machines and factories where valuable fabrics are exposed to injury from oil drippings, etc., it must be rapidly introduced."

PLATINUM-COATED IRON.—M. Dode, of Paris, the well-known discoverer of the Platinum mirrors, has invented and patented a process for coating iron with platinum. The iron first receives a coating composed of lead and copper, and then the platinum is applied. The first coating is prepared by mixing 22 parts of borate of lead and four and one-half parts of cupric oxide in oil of turpentine, and is applied by means of a fine brush. The platinum coating is prepared by converting 10 parts of platinum into chloride and mixed with five parts of ether and permitted to evaporate in the air. The residuum is mixed with a viscid combination of 20 parts borate of lead, 11 parts red lead, and some oil of lavender, and 50 parts of amylalcohol added to the whole. In this mixture the object to be platinized is dipped, allowed to dry in the air, and then heated to a moderate temperature.

NOTES ON FRACTURES.—Prof. Egleston, in a paper read before the American Institute of Mechanical Engineers, states that investigation seems to show that the fracture of almost all the broken steel rails started in defects which escaped observation, produced probably by careless manipulation. Notching or punching greatly decreases strength; drilling must be resorted to for holes. Severe cold has been observed to rapidly increase the breakage of steel rails, which is supposed to be due to the want of elasticity of the road bed.

GILBERT ELEVATED RAILWAY.—A satisfactory trial trip over the Gilbert Elevated Railway was recently made in New York. A train of four cars, containing two hundred passengers, was drawn over portions of the route at a speed of 25 miles per hour, and the feasibility of furnishing rapid transit through the streets of a crowded city was thus conclusively demonstrated. The line is more than five miles in length, and the trip between terminal points, including one stoppage, was made in sixteen minutes.

European Pattern of Rotary Engine.

We find in our foreign exchanges a description of a style of rotary engine devised by J. Congnet, of Brussels, which will enable our mechanics to compare his designs with their own. A metal cylinder is mounted on a frame and provided with covers through stuffing-boxes, in which a rotary shaft passes. Upon this shaft and within the cylinder is keyed the nave of a rotary piston, which extends from the nave to the inner surface, and from end to end of the cylinder, a tight joint between the piston and the ends and inner surface of the cylinder being maintained by metallic packing, consisting of blades or strips of brass, or other suitable anti-friction metal let into slots formed in the sides and end of the rotary piston, which blades or strips of metal are forced outward against the surface of the cylinder and cylinder covers by steam introduced into the slots through suitable holes in the said piston. A tight joint is also maintained between the nave of the piston and the cylinder covers by annular blades or strips of anti-friction metal let into annular slots formed in the ends of the said nave; the said annular packing being pressed outwards in contact with the cylinder covers by steam admitted into the said annular slots through suitable holes. The passage of the piston from one to the other of the chambers into which the cylinder is divided is secured by the use of sliding plates. Steam is admitted into the cylinder through a suitable channel formed by a steam-jacket round the upper part of the cylinder, and the steam is discharged from the cylinder by channels formed by the steam-jacket round the lower part of the cylinder. On each side of the said cylinder is a steam-chest, with a steam-port governed by a slide valve or other suitable means, and the cut-off may be regulated by any suitable means. The steam in the steam-chest, passes partly through a channel to behind the sliding plates, so as to press them inwards. Sometimes two rotary pistons are used, one projecting from each side of the nave upon the rotary shaft. The steam is then admitted and discharged on each side of the cylinder simultaneously. When the engine is to be set in motion, the sliding plates being both closed, so as to divide the cylinder into two parts, steam is admitted between the face of the piston and one of the said plates, and forces forward the said piston towards the second plate; meanwhile, the cam surface forming the back part of the piston in its rotation forces out the second plate, and causes it gradually to retire into its chamber, the cam surface gradually filling the space between the said plate and itself, and expelling any steam behind it through the exhaust channel. When the piston has passed the second plate, the plate returns into position in the cylinder, and steam being admitted between it and the piston, the same result is produced, and the piston continuing its rotation the same action is repeated.

COMPOUND ENGINES FOR LOCOMOTIVES.—M. Mallet has presented a communication to the French Academy on the application of the compound system to locomotives on the railroad from Bayonne to Biarritz. The engine has two cranks, at right angles, driven by two cylinders, one on each side. They have a range of 0.45 m., the diameter of one being 0.24 m., the other 0.40 m. Under ordinary circumstances the steam from the boiler passes first into the small cylinder, then into the large, where it acts expansively, and finally escapes into the chimney. But on starting, and whenever the engine is required to surmount an increased resistance, the steam may be admitted directly into the large cylinder, and the locomotive acts as an ordinary two-cylinder engine. The plan has been adopted in three engines, with four coupled wheels of 1.20 m. diameter; the boiler has 45 square meters of heating surface, and acts with an effective pressure of 10 kg. per square centimeter. They are employed in local traffic, on grades of 0.015. Their action is unexceptionable, their steadiness leaving nothing to desire, even at a speed of 40 km. per hour, and the management being no more difficult than in ordinary engines. The draft, notwithstanding the reduction of the steam jets to one-half, is ample, so that the boiler, in spite of its small dimensions, supplies the want of the engine abundantly. As for the consumption of fuel, the gross cost per kilometer is 4 kg. of Cardiff coal for trains weighing 50, 60 or even 70 tons. The foregoing facts are derived from a service of 40,000 km., performed since the system was adopted. They have, therefore, an important practical value.

A MECHANICAL CHESS-PLAYER.—*Iron* has been favored by the inventor, Mr. C. G. Gumpel, with a private view of a mechanical figure which plays chess, and plays it very well, too. It is not to be confounded with the so-called automaton chess-player, within which is concealed a living player, and in which a heterogeneous congeries of wheels and levers is packed for the sole purpose of deceiving the spectator. The figure, which is modeled and dressed to resemble the stage Mephistopheles, is purely mechanical, and we were satisfied that nothing was inside it excepting the chains and cords employed to produce the necessary movements. It is in a sitting position, the right arm and hand, with which the moves are made, being alone free to move, and the action is amazingly natural. Of course the intellectual operations of the chess-player must be performed in another room, the mechanical part of his duty being ingeniously transferred to the figure.

SCIENTIFIC PROGRESS.

How to Study Science.

Prof. F. W. Clarke has an article in the *Popular Science Monthly* for June, in which allusion is made to the true method of studying science: Every student of science should meet Nature at first hand, and learn to observe her phenomena for himself. Lectures and text books are but minor accessories to study; in the sciences they play a wholly subordinate part; in the laboratory, the field and the museum, the chief work is to be done. No matter what branch of science is to be pursued, the student from the very first must meet it face to face. The biological sciences ought to be studied in the field, collecting; in the museum, classifying; in the laboratory, with the microscope and the scalpel. Far too often is the study of natural history degraded into a mere memorizing of classifications; as if the transitory part of the science were more valuable than the permanent! The student must see, handle and investigate for himself. He is to study the phenomena of life, and not merely the external appearance of a lot of stuffed specimens. Chemistry, and physics also, is to be studied chiefly in the laboratory. It is not enough for a student to see experiments, he must perform them. Thus only can he learn the true scope of these great sciences. By a proper drill in qualitative analysis, he learns to observe closely, and to reason from his facts to their interpretation. Quantitative analysis gives him accuracy of manipulation, and an insight into the absolute value of experiment. This insight also results from delicate practice with instruments of precision in physics; a kind of exercise of the very highest educational value. If the course of study in any science can be capped by an original research leading to the discovery of new facts, so much the better. In a German university the candidate for a doctoral degree in science is absolutely required to carry out such a research, and to submit a dissertation upon it. This is not a severe requirement—every student who has been decently trained is able to come up to it, all the popular notions about the mysteriousness of scientific research to the contrary notwithstanding. Why should we not aim to equal the German standard?

AN ACOUSTICAL APPARATUS.—At a recent meeting of the Physical Society, Lord Rayleigh exhibited an apparatus he has employed to secure absolute uniformity of rotation of an axle for certain acoustical experiments. As described by the *Iron Age*, the axle is driven by a power just sufficient to produce the desired speed, and at equal distances around its circumference are arranged four soft iron armatures, which pass successively in front of the poles of a horse-shoe electro-magnet. The current is rendered intermittent by passing it into the body of a tuning fork, vibrating about 40 times per second, which it leaves through a small platinum stud touched at each vibration of the fork, the current traversing a small electro-magnet between the prongs, and maintaining the motion of the fork; thence it traverses the horse-shoe electro-magnet and returns to the battery. If the driving power is just sufficient to produce the required speed, the axle making one revolution to every four vibrations of the fork, the armatures will be so attracted by the magnet as to be opposite to it at the middle of its period of magnetization; but if the driving power is insufficient, or from any cause the armatures are displaced from their proper position, they will be attracted by the magnet until the error is compensated. The axle also carries a hollow metallic ring, filled with water, to act as a drag. A disk perforated with rings of holes rotates with the axle, and by looking at one prong of the fork through a ring of holes corresponding to the number of vibrations made by the fork, it is easy to see that the uniform rate is maintained by the apparent stationariness of the fork-prong.

RESPIRATION AT HIGH ALTITUDES.—At a recent meeting of the English Royal Society, Dr. William Marcet communicated a paper on "An Experimental Inquiry into the Function of Respiration at Various Altitudes." His experiments were mainly undertaken with the view of inquiry into the state of the respiration of tourists at various altitudes and under the different circumstances met with on Alpine excursions. Pectenkofer's method was adopted in the estimation of carbonic acid, and the experiments were many in number. The original mask worn to collect the air breathed out and the india-rubber bags that received the breath were described. Dr. Marcet confirmed previous experiments in the fact that the quantity of carbonic acid breathed out is greater after food has been taken, and in his experiments on respiration at high altitudes, he endeavored to neutralize the effect of food by taking an early breakfast and a late dinner and doing the climbing between the meals. Experiments were made at the Breithorn, 13,685 feet; St. Theodule, 10,899 feet; the Riffel, 8,428 feet; St. Bernard, 8,115 feet; and the Lake of Geneva, 1,230 feet. In experiments made while sitting, Dr. Marcet finds that there is an increase of carbonic acid breathed out as a person rises above the sea on a mountain excursion, and that this is due to the fall of the atmospheric temperature and to the cold produced by increased evaporation from the body, arising from

the diminished pressure of the atmosphere. In short, more carbonic acid is formed in the body to counterbalance the influence of cold from the causes just mentioned. If, on ascending to a higher level, we should find the same atmospheric temperature as we left at the lower station, still an increased amount of carbonic acid would be expected on account of the cold due to the greater cutaneous and pulmonary evaporation. Dr. Marcet experimented in a similar manner while ascending hills. Walking up rapidly over rocks and grass patches yields most carbonic acid, the amount being 3.155 grms. per minute, which, he said, was attended with the inhalation of the largest volume of air breathed. Ascending quickly at the light of St. Theodule, caused a considerable elimination of carbonic acid through the lungs, amounting to 2.972 grms. On the other hand, walking leisurely up hill at the St. Bernard gave rise to the production of no more carbonic acid than quick walking on the level ground at that same station.

SUBMARINE VOLCANOES.—We find in *Iron* record of two recent observations on the effect of submarine volcanoes. The master of the British barque *D. M. B. Park*, which arrived at Cowes, Isle of Wight, some days ago, from Batavia, reports having seen several submarine volcanoes on January 29th 7 A. M., in latitude 42° 20' N. and longitude 21° 44' W., about 900 miles southwest of Sierra Leone. Large volumes of water were thrown about 100 feet into the air, and the whole sea in the neighborhood was in a state of violent commotion with a strong under-current. The weather was calm, but with clouds and rain; sounds as of distant thunder accompanied the outburst. The other report is from New Zealand, Captain Helander, of the steamer *Go-Ahead*, while on a voyage from Gisborne to Auckland, reports having witnessed a curious phenomenon on December 1st last, between 8 and 9 P. M., when about five miles from land off Open Bay. The sea a short distance ahead of the vessel was observed to be a mass of seething foam, traveling at a rapid rate towards the vessel. The course of the steamer was changed in order to avoid the disturbance, and though it cleared the outer edge of the agitated water, the influence was felt for some time, and the vessel pitched violently until long after the actual scene of the agitation was passed. There is no doubt that the phenomenon was due to volcanic forces, a slight shock of earthquake having been felt at Gisborne on the preceding evening. When we consider that the observed effects of volcanic force on the habitable globe occur on an average once in three days, it is easy, with such examples before us, to imagine that an incessant discharge of the pent-up forces of the interior of the earth is going on, and that not a day, perhaps hardly an hour, passes without some disturbance occurring in some portion of the oceans and continents which the earth comprises.

EXPERIMENTS WITH FLOATING MAGNETS.—Prof. A. M. Mayer describes, in the *American Journal of Science and Arts*, some entertaining and easily performed experiments in magnetism. Several sewing-needles, No. 5 or 6 size, are magnetized with the same polarity, so that all their points are north. Each needle is passed into a small cork that will just float it upright; the corks may ½ inch long and 13-16 inch across. The eye of the needle should barely be above the surface of the cork. Three, four or more of these needles are thus to be floated in a basin of water, and the north pole of a large cylindrical magnet is to be brought down over them. They will immediately take geometrical positions, the figure formed being the smallest when the magnet above is brought most closely to them. Three needles thus take position at the points of an equilateral triangle; four form a square, or a triangle with one in the center; five form a pentagon, or a square with one in the center; six form a pentagon, with one in the center of a triangle of three to a side. Prof. Mayer has obtained regular figures up to a combination of 20 needles. Some of the forms are stable; the needles may be sent out of the unstable into the stable forms of vibration. The experiments may be varied to any extent by the use of two or more magnets, inducing separate combinations.

A NEW METHOD OF DETERMINING THE HEAT VALUE OF FUEL.—With regard to the important question of the heat value of fuel, it has been proved that conclusions from the results of elementary analysis are very uncertain and also that little reliance can be placed on direct evaporation experiments. In a recent paper in *Die Chemische Industrie*, Dr. Weyl points out the faults of these methods and recommends, as preferable, decomposition of the fuel by dry distillation and analytical determination of the solid, liquid and gaseous products of decomposition. In this method the accident of too small a sample being used is avoided, as also too great pulverization and drying at high temperature and the decomposing action of atmospheric oxygen, which is therewith connected, and the whole of the coke is weighed, and its carbon, hydrogen and mineral constituents determined. The water, tar and gas that are formed are measured and their heat of combustion ascertained with the aid of data that have been supplied by Favre and Silbermann and Deville. The final result will, of course, exceed the true combustion value of the coal by the amount of heat equivalent to the work of decomposition into coke, tar and gas. The decomposition of the coal should be done as quickly as possible and at a high temperature.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

VOLCANO.—*Ledger*, May 25: More gold has been taken out around Volcano at this early stage of the season than has been obtained during a corresponding period for many years back. Of course the large hydraulic claims have not cleaned up. Work has been commenced on the old Golden Gate quartz mine. The shaft in the Down's mine at a depth of 140 feet yields good ore from a ledge two and one-half feet thick. The ventilating shaft being sunk on the Volcano tunnel is down 55 feet, half the depth required. The pocket of rich quartz struck in the Keystone last week was soon exhausted. Some of the ore contained from 30% to 50% of gold. The value of the pocket, as near as we can get at it, is somewhere in the neighborhood of \$6,000. Since the pocket excitement subsided, a fine quality of rock has been uncovered in that portion of the mine bordering on the Eclipse company's mine. Parties who have witnessed test trials of the Kendall one-stamp quartz mill say it will crush three tons in 24 hours.

BUTTE.

MINING ITEMS.—*Mercury*, May 24: A large bar of gold, containing some \$32,000, was left at the bank of Rideout, Smith & Co., of this place, on Thursday, being from the Spring Valley Mining and Irrigating Co. A very fine specimen of quartz was left on our table Thursday, having been found in the pocket of Peter Allis, who was found dead near Cow creek a few days ago. The mining claim of C. M. Ury, on the South Fork, is being worked quite extensively this spring. It is a bar claim, and supposed to be one of the richest in the county. Mr. Ury is working a crew of eight men, and is putting through a large quantity of gravel each day. He has got all the machinery needed, and it is running well and at but little expense. No doubt we shall hear good reports from this direction this summer.

CALAVERAS.

HYDRAULICS.—*Chronicle*, May 25: The gravel mines in this vicinity are in full blast. There is an abundance of water and the miners are making good use of it. There will be some heavy clean-ups shortly.

"THE GOLD INDICATOR."—S. W. Howland, who has been prospecting in Calaveras with his "Gold Indicator," has made the discovery that a rich deposit of gold is lying in the crevices of the bedrock in the Mokelumne river, on Mrs. Hill's ranch, at the mouth of Camanche creek, and has formed a company called the Camanche Gravel Mining Co., for mining the ground with a dredging machine, known as Dennison's Patent Incurigator. A barge will be built on the ground and the machine will dig out its own channel by the suction principle, lifting up the dirt, sand and gravel containing the gold by a powerful suction, which will reach into all the crevices of the rocks and bring up its hidden treasure. One of the machines has been used on Middle river for a year past, dredging material for levees on Union island. It is thought that a large pocket of several tons of pure quicksilver, freighted with gold, will be found in the river, as the wastage of a quarter of a century of gravel mining in the numerous gulches and claims above. The ground has never been worked and is considered immensely rich. Mrs. Hill's alluvial farming land is being slowly mined out by Chinamen, who dig out the gravel and replace the earth in its normal condition, paying her a percentage, which yields her a revenue of \$200 a month. Indeed the alluvial banks of the river for miles have been worked over with profit, and it is reasonable to suppose that there is a rich deposit on the bedrock of the stream hitherto untouched.

EL DORADO.

OUR MINES.—*Republican*, May 23: The Pacific has cleared out the old drifts, retimbered where it was necessary and prospected a little, taking out some fine looking ore. The works are now nearly at a stand-still, awaiting the arrival of Thos. Price, who is to inspect and give further instructions as to future work. The Rose is being gone down upon, through a body of good looking rock, and the indications are decidedly favorable for a "big thing." Now down 150 feet. At the Keegan, things are being pushed, but the prospects at present are by no means flattering. If the same company have the nerve to continue operations a few weeks longer, something better may be developed. At the Hallock, things are progressing and look exceedingly favorable. The mill was started up on Sunday evening, with greatly improved appliances for saving gold. A run of 80 tons of ore at the Gross mill, Poverty Point, by a couple of recent comers, last week, yielded about \$15 per ton.

RICH CEMENT.—Hancock, Salter and the Oldfield brothers have opened a fine deposit of rich cement at their claim on Negro hill, just above Placerville. Several prospects made yielded from \$8 to \$15 to the pan, lead gold, some specimens weighing as much as \$2.50. Their claim covers about two acres, and their prospectings have proven that next the bedrock the cement deposit covers nearly the whole.

THE KEEGAN MINE.—Appearances here are

not as flattering as they were some weeks ago. The gentlemen who have the mine bonded, commenced drifting, a short time ago, both north and south from the 60 level. In both directions the level has narrowed almost to "pinching out" dimensions and an experimental crushing of 80 tons of quartz has hardly realized sanguine expectations. Nevertheless, the company are anxious to make a thorough test and inclined to make further explorations, sinking the shaft to a considerable depth, if Mr. Keegan will extend their time, which he will probably do, as it would be much to his interest.

NEW DITCH.—Mason & Kluough have a large force of men at work on a ditch, to bring water from Silver creek, over the ridge, to work their gravel mine, opposite the Pacific house. The ditch will be nearly 10 miles in length, when completed, and will carry over 500 inches of water.

FRESNO.

CENTENNIAL.—*Expositor*, May 20: The developments in this mine, situated near the head of Big Dry creek, are very favorable. The ledge has widened out considerably, and the ore is very rich. The owners of the mine are thinking of incorporating it and selling part of the stock, for the purpose of raising funds to put up a mill.

INYO.

GOLD QUARTZ MINES.—*Independent*, May 18: A number of ledges, that assay well in free gold, have been discovered in the Beveridge district, lying on the easterly slope of the Inyo range, some 12 miles from Cerro Gordo, and on the head of Big Horn canyon. The mineral belt, so far as known, extends from east to west about two miles and from north to south about one mile. The ledges, which run east and west, appear to be permanent, out-crop for a considerable distance, are from one to eight feet in width and assay from \$50 to \$150 to the ton. The gold occurs in the quartz in wires, scales and plates and are throughout associated with auriferous ochre, pyrites, chalcopyrites and galena, the pyrites largely exceeding in quantity all others. The inclosing schist is soft and easily removed in mining, thereby easily showing up large bodies of ore with comparatively little labor. The discovery appears to be a valuable one.

PLUMAS.

BUTT VALLEY.—*National*, May 18: The mines in this vicinity are all in full blast. The water of the Dutch Hill ditch was turned into the big pipe yesterday. The Dutch Hill tunnel is leased to other parties, the former lease having expired. The boys who had the first lease declared a div. of 5,000, and left a week or so ago. There is a chance for a big excitement in this district from the valuable discoveries that have been made during the past season. The "hoss" of Plumas is now the Savercool ledge. It is very rich and extensive. Forty-cent cents were obtained from half a pound of rock, and as high as five dollars to the pound. They have a tunnel in about 60 feet which shows a well-defined ledge eight feet wide, and it can be traced 6,000 feet. The rock prospects as well in one part of the ledge as another. It is rumored that the owners were offered \$50,000 for their claim which they refused, and wanted \$60,000. Baptista Picazoni, discovered a huge ledge not long since while running a bedrock tunnel to tap a channel. It is 20 feet wide and prospect well in free gold. There is a good deal of decomposed quartz and the hard rock shows fine results when pounded.

PLACER.

ABOUT DUTCH FLAT AND GOLD RUN.—*Forum*, May 23: The Gold Run English company will make a general clean-up this week, the yield from which is thought will be very large, owing to the known richness of the ground. Another powder drift is being run towards Potato ravine, the gravel extracted from which is exceedingly rich. The Miners Ditch company are doing extensive and profitable work at Gold Run. This company, having made three successful runs on the Illinois claim, are now at work on the North Star. Washing progresses steadily in the Sachs mine, the results from which are giving satisfaction. With the employment of seven men and the 500 inches of water utilized, the Church and Golden mine is being made to show unmistakable signs of a remunerative season's work. The Canyon creek undercurrents, belonging to Moody & Co., and those of Mr. Kinder's, which take their head at the tunnel of the Gold Run and Miners Ditch companies, are doing unusually well. Washing in the Baker was resumed on Monday. The third general clean-up in the Central mine will be made next week. Good results are looked for as the washing has progressed without interruption. The Lakamp mine now shows a bank of gravel 200 feet in depth. The gravel, although very hard in places, is worked to good advantage through means of holes bored with a 1½ inch drill, in which giant powder is inserted and exploded. The outer bench of gravel belonging to the Boston mine is being operated on by two men and 500 inches of water. The raising of the second incline has been completed in the Franklin, through which the mine is now worked. The bank, which shows splendid in blue gravel, has an average depth of 130 feet, and still increasing as they advance towards the channel. The Polar Star and Southern Cross continue to make extensive progress. Two powder drifts were exploded recently, and five more drifts are well under way, which, when completed, will be charged and exploded. A general clean-up will be made in both mines the first of June. Washing in the Elmore Hill

mine continues steadily. The new derrick, which has been in use about three weeks, is doing splendid work.

TRINITY.

BUCKEYE.—*Journal*, May 25: From A. J. Reed we learn that five companies have been working on Buckeye creek the past winter and that everything has been favorable. Mr. Reed who worked the claim highest on the creek, is the only one who has cleaned up any as yet, his mine "panning out" very satisfactory thus far.

BOALT'S HILL.—Capt. Atkins informs us that water is now run through the entire length of the Buckeye ditch and that a great deal of work is being done in the mine at Boalt's hill. We also learned that a clean-up was made in the mine last week, but was not informed as to the amount taken out.

TUOLUMNE.

HUNTER MINE.—*Union Democrat*, May 25: Hunter mine at Big canyon with the parallel vein belonging to the same claim is incorporated under the name of the "Gold Hunter Consolidated." This is undoubtedly a valuable mine and the fact that Mr. Long has been appointed to the superintendency will be a sure guarantee that it will be managed with honesty, economy and energy, he having had great experience in quartz mining and his long residence here has made him thoroughly familiar with the nature of the veins and leads in this section. Mr. Long is already at the mine and will commence work on the parallel vein immediately. The mill and machinery will be put in repair as soon as possible and work recommenced on the lower tunnel, which it is expected will strike the rich ore of the Hunter chute within 20 feet of its present termination.

SHASTA.

FROM THE MINES.—*Record*, May 25: Latest reports from the mining districts say that the miners are blessed with an abundance of water, and, in some instances, rich gravel. Taken all in all, the outlook is encouraging. Parties just arrived from New river, Humboldt county, report the discovery of new placer diggings on that stream. The diggings are said to be rich, but their extent is not yet known. Considerable excitement prevails concerning this report, as it has been long believed that rich mines would be developed in that locality. The gold is coarse.

SIERRA.

WATER STRIKE.—*Downsville Messenger*, May 27: The Bald Mountain company struck a heavy flow of water in their mine a few days ago. The water broke through the pipe-clay in gang-way 77, and ran about 60 inches for a time, but finally subsided to about 40 inches, and remained at that at last accounts. Several breasts were caved, and the workmen were obliged to leave the mine for a time. If the volume of water will continue through the dry season it will prove of great value.

SAN DIEGO.

HOPED FOR.—*News*, May 26: For some days past there have been rumors of new discoveries of placer mines a short distance from the city. A number of persons have visited them, and from a gentlemen of large mining experience we glean the following facts: The discoveries are at the base of the San Isidro mountains, about 30 miles from San Diego, and two miles north of the Mexican line. There are, up to this time, but two or three claims that are paying anything, although there are a large number of prospectors in the neighborhood. It is probable there are rich mines, both placer and quartz, in that vicinity, though, as yet, they are not found.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, May 29: Daily yield, 350 tons of ore, keeping the California mill steadily running. The ore stopes on the 1200, 1650 and 1750 levels afford no change worth noting, the ore being of a good uniform character and the breasts all showing favorably. The porphyry in the face of the west drift on the 1850 level was softening and showing signs of a near approach to the ore vein at six o'clock last evening, and it is more than likely that this drift will cut into the ore at that point today. The first section of the repairs, reaching from the depth of 500 feet to the surface, will be completed by Saturday next, ready to put in the guides. As soon as this is done, another, and by far the worst section of the repairs will be commenced at the 1500 station, the men working upward.

CALIFORNIA.—The ore stopes on the 1600, 1650 and 1750 levels afford no material change to note, but are each yielding their usual quota of rich ore. The east drift on the 1950 level is steadily advancing, the face in perfectly dry ground, and will complete a connection with the 1950 station of the C. & C. shaft a week from today if nothing happens to cause delay. The south drift on the 1950 level running to connect with the north drift from the Best & Belcher winze on the south line of the Con. Virginia, is making steady progress.

OPHIR.—Sinking the winze below the 1900 level is going vigorously forward, the bottom still in good ore. This winze is now down 108 feet perpendicularly, the entire size of the shaft having passed through rich, unbroken ore for the last 40 feet. What may be the width and extent of this ore cannot of course be told until matters are in proper shape for crosscutting. It is the intention to push this winze on downward to complete an air connection with a drift

shortly to be started eastward on the 2100 level.

SAVAOE.—The east crosscut on the 1640 level is now in a distance of 190 feet, having passed entirely through the porphyry after penetrating the 25 feet of low grade ore first found, the face now being in a splendid character of quartz, which shows improvement with each foot of advancement made.

BELCHER.—The pumps are being lowered and the pump-rods put in the incline shaft from the 2160 down to 2360 level. Sinking this shaft has been discontinued for a short time, in order to finish up the 2360 station. Sinking the south winze below the 1900 level to meet and connect with the south drift on the 2160 level is making good progress. As soon as this connection is made, crosscutting the 2160 level will be commenced.

JULIA CON.—The water is entirely drained from the 2000 level, and two crosscuts east have been started, one 100 feet south of the shaft and the other 200 feet. The first of these drifts will follow up the drill hole recently run until the quartz is reached. The heat is yet very great on this level, the steam created by the hot water being at times almost suffocating.

SIERRA NEVADA.—All the work in the mine is at present being done on the 2000 level, which is being opened up in the most energetic manner. At that point four drifts are being run, one east, one west, one north and still another south.

MEXICAN.—The retimbering and enlarging of the connecting drift with the Sierra Nevada on the 1600 level has already greatly improved the air circulation in both the Mexican and Union Con.

UTAH.—The south drift on the 1350 level is steadily advancing toward the south line, the face in favorable vein material.

HALE & NORCROSS.—Cleaning out and repairing the north drift on the 2100 level, which connects with the Savage mine at that depth, is making about 4½ feet per day, the heat being intense and progress necessarily very slow.

SILVER HILL.—At a point 440 feet north of the main east lateral drift, a crosscut has been started to the eastward, the face of which is in a fine quality of metal-bearing quartz.

YELLOW JACKET.—The north winze below the 2200 level is down 305 feet, following the slope or inclination of the ledge; bottom in quartz and porphyry, quite hard and dry. The new Yellow Jacket shaft is now down 1,467 feet.

JUSTICE.—Daily yield, 80 tons of ore. This ore is of as good or better a quality than any that has been extracted and crushed from the mine for the past two years. The south drift, on the 1300 level, is steadily advancing, the face showing good quartz, with spots of very rich ore.

CALADONIA.—Sinking the joint winze below the 1400 level on the Overman line has been temporarily stopped on account of the strong, steady flow of water at the bottom.

OVERMAN.—The east drift from the 1600 station is being pushed rapidly toward the ore vein. The east drift on the 1100 level is steadily advancing through a splendid body of quartz, which shows little or no ore as yet.

LADY WASHINGTON.—The ore stopes being opened on the south line on the 1000 level show the vein of paying ore at that point to be about 10 feet in width and of excellent quality.

CON. IMPERIAL.—Cutting out, enlarging and timbering the main north and south lateral drift is being pushed ahead with steady vigor, preparatory to a general crosscutting and prospecting of the entire ore vein on that level.

CROWN POINT.—The south drift from the bottom of the double winze on the 2300 level is being pushed vigorously forward to connect with the north drift, which will be started from the Belcher, to-day, on the same level.

ALTA.—The prospecting drifts on the 1350 and 1250 levels are being pushed vigorously ahead, to open up the ore vein, which, when accomplished, will lay bare a large portion of the ore vein ready, whenever it is desirable to do so, to commence the extraction of ore.

UNION CON.—The joint east crosscut on the Mexican north line is now in a distance of 356 feet, the face still in blasting porphyry, carrying lively looking streaks of quartz. It is now in a distance of 388 feet from the north line.

BULLION.—The east drift on the 2000 level is being again vigorously advanced, although it is necessary to use great caution, as the ground in the face of the drift is quite soft and difficult to sustain. The prospects of finding an ore bearing vein of quartz in this drift is quite favorable.

GOULD & CURRY.—Owing to an increase of the great heat in the south drift on the 1900 level, caused by the large amount of water in the main incline below the 1800 level, work in that portion of the mine has been abandoned until the main shaft is completed to that level.

CHOLLAR-COMBINATION SHAFT.—This shaft has attained a perpendicular depth of 2210 feet, the bottom being in hard blasting rock.

SUTRO TUNNEL.—Total length of tunnel, 19,766 feet. During the past week the heat has not increased in the header, but even the regular 100° may be considered pretty warm. The ground is hot and dry, but works well, better than last week. It is the regular Comstock ledge matter—quartz and porphyry with streaks of clay, and occasionally a bunch or feeder of low grade ore.

CHERRY CREEK DISTRICT.

THE MARY ANN.—*Independent*, May 25: A body of rich ore has been struck in this mine. The ore runs from \$65 to \$300 per ton, and has

been drifted along for a distance of 179 feet. The thickness, height and depth of the ore body is not known, but it is believed to be a most important development.

STRIKE IN THE PAYMASTER.—The mass of ore encountered in this mine below and to the west of the old clay chamber, proves to be the largest body of ore yet found in the mine, and is certainly far richer than any one body of equal size in the State.

ELY DISTRICT.

RAYMOND & ELY.—*Pioche Record*, May 18: Driving ahead in all the levels on which work is being prosecuted; there is no marked change to note either way. The work on the 12th, at the head of the winze, consists of excavating to place in the hoisting machinery. The prospecting drifts on the eighth and ninth are both looking very favorable. From 15 to 20 tons of ore being daily extracted. Mill running as usual, half on ore and half on tailings. Are excavating on the surface for the foundation for the air compressor.

MAYFLOWER.—There is an improvement in the bottom of the incline shaft, consisting of streaks of ore and general good indications. There appears to be a general improvement in the appearance of things in the mine.

DAY.—Nothing of special interest to report; same work going on in the tunnel and winze; the winze still in low grade ore, as has been reported for the last two weeks.

ALRS.—Work progressing in the mines of this company the same as in report of last week. Mill running regularly.

EUREKA DISTRICT.

ABOUT EUREKA.—*Sentinel*, May 25: The ore on the dump at the Hoosac, and now being developed in the mine, is free from refractory constituents, and is as good smelting ore as can be found in the district. The first instalment of 50 tons of flue dust went forward yesterday. About 6,000 tons will be shipped. Fair progress is being made at the Eureka tunnel. The face is in good working rock. The flow of water continues unabated. The Prospect mountain tunnel is now in 700 feet, the face being in hard limestone. The contractors are pushing work as vigorously as possible. The product of the Richmond furnaces is still largely in excess of the capacity of the refinery. There is enough crude bullion on hand to run the latter institution for the next four months. The recently developed ore body at the Industry is looking well, and promises to expand into a large deposit. Parties are examining property over in the Silverado district, with a view of investing. The Queen mine is the objective point. The first instalment of Gila bullion passed through Wells, Fargo & Co.'s office Wednesday last. It will be followed by frequent shipments. Work on the Bald Eagle mine is being carried forward vigorously. Considerable ore has accumulated at Mineral hill, and the boys are looking forward to the time when the mill will start up, and flush times begin. The ore shipments to Utah have been very light for the week past, although large quantities have been purchased by Salt Lake buyers. Considerable prospecting is being done on Hoosac mountain, and those holding locations in that vicinity are very sanguine of future developments. Furnaces will start up on Hamburg ore about the middle of June. The Eureka Con. Co. use 160,000 bushels of charcoal per month.

Arizona.

HUMBURG DISTRICT.—*Miner*, May 17: The Mariposa mine is full five feet between walls, all pay ore. Samples taken for an average and assayed, by Judge Walsh, give \$417 to the ton, at the depth of 20 feet. They have been in water rock for a distance of four feet, and find a considerable quantity of ruby silver. The ledge improves in size and richness below the water level; in fact, it has steadily increased from the surface down. The owners are confident that they have a good property. The Black Jack and Yosemite mines, near the Mariposa, are being worked. The Black Jack ore yields by mill process about \$400 to the ton; and the Yosemite, according to Judge Walsh's assay, goes \$325.97. There is a 22-foot shaft on the latter, showing a pay streak of from 12 to 18 inches at the bottom. The walls in all these mines are smooth and well-defined, indicating true fissure veins.

The Hassayampa hydraulic mining company own 1,000 inches of water and 160 acres of ground in Weaver mining district, about 50 miles from Prescott. The ground is loose yellow clay, and will yield from one cent to two and a half cents per pan, and is from 15 to 75 feet thick on a bed of cement gravel. They will bring the water through pipes for a distance of about three miles and a half, which will give them a fall of 140 feet. The company proposes to raise \$30,000 on their stock in the East, for a working capital.

Colorado.

CLEAR CREEK COUNTY.—*Miner*, May 18: Work on the mines here is active with fair prospects. On the Leavenworth mountain claims the Kirtley is considered about the most profitable as well as promising. Eleven men are worked on the day, and five on the night shift. The Colorado Central, the Equator, the Steamboat and the Brannigan are opening up with good ore and prospects.

THE BASSICK.—This mine is taking out more heavy ore than ever before. About 20 tons of ore, which will mill up in the thousands, is piled up in the shaft-house, and the supply of ore from the shaft is so tremendous, that the

large force of ore sorters have to work Sunday and every day to get the ore out of the way, and this from four men's work in the mine to the shift. Solid blocks of rich ore carrying sulphides, sulphurets and antimonial silver, heavy with gold, weighing 20, 30 and 50 pounds, can be seen on the floor of the shaft-house in great profusion. This mine seems to be inexhaustible.

Montana.

FRENCH BAR.—*Helena Independent*, May 16: Work has been commenced here with good prospects. In the first place, there is an abundance of water; and secondly, good use is being made of every drop of it. All the hydraulic claims are running full-handed, and although no clean-ups have been yet made this season the outlook is extremely favorable.

BEAVERHEAD.—Mining is flourishing here. Phil. Shennon is still taking out money with his arastra. Ore from the Dacotah is being crushed in the Carhart mill. Formerly this lode paid well, and present indications are favorable that it will continue to do so indefinitely. Mr. Kemp is operating a mill for Judge Meade at Elkhorn, but the snow being deep it has greatly retarded operations. In fact, there has been a goodly quantity of rain and snow lately in this section of the country.

New Mexico.

LAS ANIMAS.—*Grant County Herald*, May 11: Some of the gulch mining here will turn out fairly. In the Perchs River gulch pan after pan has been taken out, running 20 to 30 cents to the pan. Other gulches, to the number of at least a dozen, in the district, show gold in apparently the same proportion, but being without water no fair test can be made. It is estimated that two of the principal mines in the district could keep a 20-stamp gold mill in constant employ. Dugan has a 40-foot tunnel and two 40-foot shafts on the King proper. Breen, Winter and Clark have done much to develop the Argosy. They have in sight an eight-inch vein, the lowest assay of which shows \$65—and have turned out ore which is conceded to be the richest in camp. The Bobtail mine belonging to Pappin and Pitcher shows a three-foot vein and the last clean-up netted \$52 to the ton. A tunnel of 140 feet has been run on the Weeks mine. Yankie & Co. have a 100-foot tunnel in the King Extension, besides two shafts of 50 feet each. Other portions of the district are being rapidly developed, and no one now doubts the result. There are already 10 well developed mines in the district: the Centennial, Ready Pay, Weeks, Snake, Yellow Jacket, Argosy, Lilly of the West, Montezuma and Bobtail. To add to the value of the district, rich silver mines have recently been discovered in the immediate vicinity. This discovery was made by a Mexican who brought in specimens of the ore and had the satisfaction of hearing them pronounced by experts to be of high grade. He is now sinking a shaft and the ore improves as he goes down. Altogether Dona Ana county has reason to rejoice.

Utah.

SAN PETE.—*Salt Lake Tribune*, May 24: Quite an excitement has been raised among miners over the discovery of rich silver-bearing ore in San Pete valley. Choice samples of the ore from the surface assay as high as \$1,000 silver, a few dollars in gold and 20% copper. But the trouble is no continuous veins are to be found, the ore being discovered in small pockets and petering out at a depth of only a few feet, leaving no trace to follow. The character of the surface ground resembles that of Miller bill in American Fork, but it is believed that there is a large mineral deposit in the San Pets region as there is in American Fork.

THE EMPIRE.—This property of this company is situated in the Park on the westerly extension of the great Ontario vein, and consists of 14 locations. Work on both the O'Brien and Prince Oscar has been prosecuted during the past winter, and the first named of these now has a perpendicular shaft down 125 feet, while the latter boasts of an incline shaft of equal depth. Hoisting machinery has been purchased, we understand, and will be in operation at the mine within six weeks from this date, after which the work of development will be pushed forward with all possible vigor. The future of this enterprise is bound to be great; the success of the Ontario forebadows it. There is a great Comstock in the Park, and the claims of the Empire Co. cover a large portion of it.

MUSICAL BOXES.—The roar of the great May musical festival will not drown the sweet melody which is poured forth by the musical caskets of M. Paillard & Co., 120 Sutter street. These little gems of harmony, made by a branch of the firm in Switzerland, and sold in San Francisco by the makers, are unequalled in their construction and performances. They are elegant articles for presents to friends, and they are charms to possess for oneself. They amuse by their wonderful power, and they soothe and instruct by the faultless execution of the finest musical airs. The excellence of the instruments is sufficiently attested by the high awards which have been made to them by world's fairs and local exhibitions, and they commend themselves to all who come within the sound of their trills and cadences. M. Paillard's establishment at 120 Sutter street, should be visited by all who come to see the sights of the city.

News in Brief.

THERE were 82 deaths in this city last week. A THOUSAND Chinese fishermen are operating at Point San Pedro, San Pablo bay.

HALF a million orange trees are growing at Riverside, Los Angeles county.

A CAR-LOAD of eggs from the East has arrived at San Francisco.

MOHAIR in considerable quantity is being shipped from southern Oregon to this city.

A WATER-SPOUT burst at Barrington, a suburb of Chicago, killing three persons.

UTAH potatoes are selling in Deadwood at five cents a pound.

THE prices of both government and railroad securities have improved lately in the East.

A TREE at Marysville, nine years old and 11 feet high, upon which there are 1,100 oranges.

THE trouble among the settlers in Tulare county in regard to railroad lands continues.

A TON of honey was received at Los Angeles, last week, from the bee ranch of Butler & Co.

JAMES GORDON BENNETT won \$60,000 betting on O'Leary's winning the great walking match.

THE bill creating the Territory of Oklahoma has been agreed upon by the House Committee.

By the jumping from the track of a train at Dutch Flat last week, six cars were wrecked and Charles Cassidy, a brakeman, killed.

GOV. HARTRANFT, of Pennsylvania, has appointed delegates to the International Prison Commission at Stockholm.

THEY have had destructive floods at Deadwood in the Black Hills, also at Denver, Colorado.

THURLOW WEED pronounces Moody the greatest preacher that has appeared since Paul's time.

THE famine in China is pressing upon 15,000,000 of people, while 60,000,000 are suffering more or less distress.

NARCISSE, a Frenchman, shot himself at Pleasanton in the mouth, causing instant death. Cause unknown. He leaves a wife in Paris.

THE baker at St. Vincent's Orphan Asylum, at San Rafael, committed suicide by shooting himself one day last week.

HENRY ROBERTS (colored) was hanged at Shelby, N. C., last week, for murder. He died protesting his innocence.

ALEXANDER H. STEPHENS announces himself as a candidate for re-election from the Augusta (Ga.) District.

THE total receipts of the Cincinnati musical festival amounted to \$67,500; the expenses, \$40,000.

SEVEN large mills at Fall River have stopped for a week, and in a few weeks all the mills will probably run only half time.

IN 1850, the length of the railway lines all over the earth was only 19,000 miles; in 1875, it had increased to 200,000.

A LARGE mass meeting of the Socialist Labor Party was held in New York, May 25th. Addresses were made in English and German.

THE Free Labor Exchange last week found employment for 94 persons, of whom 75 were men, and 87 of them were sent into the country.

THE Maxwell land grant in New Mexico contains over 60,000 acres of coal lands, in which the average thickness of the coal bed is six feet.

CAPT. J. B. MOORE, formerly of this city, now a ranchman in central Nevada, will be a candidate for Lieutenant-Governor in that State.

JOHN BRIGHT said in a recent speech at Rochdale that one-third of the whole land of the United Kingdom, being no less than 23,000,000 acres, belongs to 935 men.

MOSES, chief of the Northern Indians, says he desires peace with the whites. The people of southern Idaho are fearful of trouble with the Bannock Indians.

JUDGE HOFFMAN has decided that the \$19,821.55, recovered from the wreck of the steamship *San Francisco*, belongs to the party of divers who secured it.

THE Pennsylvania State militia is rapidly being placed on a war footing in anticipation of labor troubles at Pittsburg and in the coal regions.

FRANK DALY fell off a freight train near the American river railroad bridge on the evening of the 23d ult., and 20 cars passed over him. He died in a few hours.

On the 11th of April a tornado swept over a portion of the city of Canton, China, destroying 9,000 houses and causing the death of about 10,000 persons.

THERE is an exhibition at the Paris exposition a silver set manufactured by Tiffany & Co., of New York, for John W. Mackey, that cost \$200,000.

OPIMUM smoking is rapidly increasing among the white men and women of Virginia City, who visit the Chinese quarter day and night to indulge in this disgusting and hurtful practice.

THE late tornado in Wisconsin turns out to be more destructive than was at first supposed. Thirty lives were lost and nearly 100 people injured in a single county, besides a vast amount of property destroyed. The track of the storm was from a quarter to half a mile in width and extended over several counties.

STEWART's hotel for women, which was opened not long since in New York, is said to have proved so much a failure that it is to be transformed into a general hotel, the number of boarders having dwindled down from 60 to 15, while the expenses are \$700 daily.

OVER 500 Chinamen arrived lately at Portland, Oregon, direct from China. Great numbers of these people are entering the mines of Oregon, Idaho and Montana, by way of the Columbia.

MORITZ MARKS was drowned last Sunday while bathing at North Beach.

NEW YORK brewers are sending beer to Germany.

Of the 2,500 doctors in Philadelphia, 500 are homeopaths.

THE cars are again running between Vallejo and Sacramento.

LAST month \$2,470,000 of the new silver dollars were coined.

PROF. MARTIN made another successful balloon ascension on Sunday last.

THE Chinese butchers in this city are being arrested for keeping their shops open on Sunday.

THE improvement in the iron trade is thought to denote an amendment in business generally.

ACCORDING to the Yuma *Sentinel*, the condition of Indians on the Colorado reservation is truly deplorable.

IT is rumored in Cheyenne that four companies of cavalry will leave Fort Russell shortly for the Big Horn country.

OKAES AMES was supposed to be worth \$15,000,000 when he died, but the estate will not pan out over \$25,000.

GEORGE FOZARD and Edward Drummond were drowned on Sunday last by the upsetting of a boat off Angel island.

THE citizens of Chicago are arming against apprehended disturbances from the Communists.

THE Russian government is negotiating with the Boston Iron Company for the manufacture of heavy ordnance.

PERALTA accomplished his feat of riding 305 miles in 15 consecutive hours at Fleetwood Park, New York, in 14 hours and 31 minutes, having 29 minutes to spare.

A TERRIFIC rain-storm and flood occurred in Colorado lately, doing great damage in Denver, and on the railroads in that section several lives were lost.

FOUR camels, three young and one old, have been running at large near Mineral Park, Arizona. The old one is supposed to have been one of the 30 brought over in 1855 at the expense of the government. They live on cactus and sage brush.

Nevada County Mines.

Mr. W. Rose, who has just returned from a trip through our California mining districts, furnishes us with the following notes:

Although for a long time dazzled with results of the silver mines of the Comstock, which have diverted such vast amounts of California capital into the State of Nevada, which if invested in the gold mines of California would have shown far richer results, our people are at last coming to realize that it takes two gold mines to run one silver mine, and are commencing with new energy to look after our California gold mines, which have been for a series of years quietly, but steadily, putting money into the pockets of their owners, and adding millions to the wealth of our State.

It is believed that in proportion to the amount of capital invested in their development, the quartz mines of Nevada county in the immediate vicinity of Grass Valley and Nevada City can show richer results than any similar area of mining ground in the world.

Under the prudent and practical management of Mr. Coleman, the Idaho mine has paid 154 dividends, ranging from \$7.50 to \$22.50 to a share. The Providence, Empire, Gold Hill, New York, Greenhorn, Washington and Champion are also being worked with the same flattering results, which if coming from the silver mines of the State of Nevada, instead of the old gold mines of Nevada county, California, would create a sensation in mining circles in San Francisco. The Champion, which is an extension of the Providence and a consolidation of seven different locations, and into which a tunnel has been run for 350 feet, has developed an immensely rich ore body. The Branch Mint, Victoria and the O'Conner, mines upon the resumption of the work, also add greatly to the wealth of our State. While millions have been sunk in mines outside of our State by citizens of California, the mines mentioned above have thus far been successfully worked without appeals to our capitalists or aid from the San Francisco Stock Boards.

STANDARD GEOGRAPHICAL NAMES.—According to Professor Hayden, U. S. Geologist, the future schoolboy will be put to his wits ends to follow out our geographical points in the Great West. There seems to be a scarcity of names and a multiplicity of objects; in consequence of which names are duplicated right and left. Thus, we can find almost any number of "Pyramid Peaks," "Round Tops," and "Bald Mountains," and "Crooked Creeks," and so on, which is all extremely confusing, where identification is necessary. Professor Hayden suggests that the general government issue a map of the country, which shall exclude all duplicates, adding new names for old ones discarded, and which shall become standard authority for our geographies.

NELSON BUSH and a man named Johnson got into an altercation at White Pine the other day, when the latter discharged a pistol three times at his antagonist, shooting him through the hand. Bush then got hold of the weapon and shot Johnson dead. Cause of the trouble, cards.

THE ENGINEER.

Guarding Chimneys from Lightning.

Tall chimneys of manufactories and mills often invite the lightning stroke in places where thunder storms prevail. How to guard them was lately discussed, by Mr. Morrison, before a foreign engineering society. It was his belief that half the chimney conductors in existence are really more dangerous than serviceable. The mischief done by lightning is caused by its determination to force a passage to the earth through bad conductors, such as stone or brickwork. There can be no danger in the case of good conducting bodies with proper earth contact, excepting they be too small. Then the damage will be probably confined to their injury by heating or destruction by melting. Lightning, when it strikes, takes the course to the earth which offers the least resistance, which, in a properly protected chimney, is, of course, the conductor. This it passes quietly down and leaves the chimney itself untouched. I had been in the habit of using insulated copper ropes, till I erected the "Atlas" chimney, when I went in for one of Sanderson & Proctor's three-quarter by one-eighth inch copper taps, attached to the chimney with ordinary staples, which I now consider a very good and convenient form of conductor. The important thing, however, is not so much the form or the insulation of the immediate supports as to see that each terminal is in order. This should, in spite of any little inconvenience, be ascertained personally. The upper terminal rod should be attached to the chimney cap, if a metallic one, and its lower extremity in perfect continuous connection with the rope, rod or tape. Its upper end should project a few feet over the chimney summit, and should be spread out into or be provided with a number of points. The earth terminal should first be threaded through one or more lengths of cast-iron pipe, and then attached to a large piece of old metal, carefully imbedded in the damp soil. The pipe is merely a provision against the injury or corrosion of the buried portion of the rope or tape. This, I think, all that need be said about conductors. The great danger is when, as is frequently the case, the connections are broken, and the rope is allowed, perhaps for months or years, to flap idly about in the wind. To reduce the danger of this, I have sometimes thought of inclosing a wrought-iron tube or rod within the substance of the brickwork, but the idea is one I have not yet carried out. Its advantage, besides that of protection from the weather, would be in its perfect straightness. The efficiency of external conductors is, I fancy, frequently marred by their being closely bent to conform them to the intricate angles and curves of caps and cornices. And now just a word about flues. As gaseous, like liquid, currents cannot turn sharp angles without making a fuss, corners in main flues should be persistently avoided and gentle and regular bends substituted. All tributary junctions likewise should, without exception, be inclined towards the direction of the flow, so that branch currents may be enabled to peacefully and calmly merge into the general stream.

Building a Railway Pier.

A writer in the London *Mining Journal* gives a description of the construction of the Huelva pier of the Rio Tinto railway, as follows: The total length of the pier and of the approach from the station yard was 2,444 feet. The screw pile portion was 1,900 feet long. The distance was made up of 29 spans of 50 feet each, and 30 groups of cast-iron screw piles and columns, eight in each group, placed 15 feet apart from center to center. The pier-head, alongside which the ships were moored, was protected by the shipping deck wharf. This wharf was independent of the cast-iron piling, and composed of creosoted red wood Memel fenders supported by creosoted Memel piles, cross bearers, transoms, and longitudinal wallings. The face of the wharf opposite to each span was close-sheathed with timbers, measuring 12 inches by 6 inches, for a distance of 50 feet, the remaining portion being protected by vertical fenders placed at intervals of three feet from center to center. The depth at low water spring tides at this wharf was 15 feet. There were three floors at different levels throughout the length of the pier, and upon these were laid seven lines of rails. These floors were carried upon wrought-iron lattice girders four feet deep, and were supported by the screw piles and columns. The cast-iron hollow screw piles were 16 inches in diameter, and the lowest length of the pile shaft was fitted with screw blades five feet in diameter and having a pitch of six inches. The principal difficulty was the want of solidity of the foundation, which proved to be worse than was at first anticipated. With two series of lines, one above the other, a greater load had to be borne than if the pier had simply to carry the work of the mines. It was found that the screw piles alone would not give sufficient area of base unless considerable expense was incurred in construction. It was therefore decided to provide additional bearing surface by the introduction of timber platforms, fastened to the piles by cast-iron discs, which clamped the respective piles below a collar cast specially on the pile shaft, so as to rest upon the disc. In this way the load on the pier was transmitted through the columns, piles and

discs to the platforms, which rested on the bed of the river. The platforms at the shore end were weighted to 300 tons, and those in the deep water section to 500 tons. When the loaded platforms ceased to sink, a diver was sent down to fix the discs forming the connection between the piles and the platforms, and the load was then removed.

Maryland and Delaware Ship Canal.

In the Senate recently Senator Whyte asked for an appropriation of \$5,000 for surveys across the Eastern shore peninsula, to ascertain and report upon the best route for a ship canal to connect the waters of the Chesapeake with those of the Delaware. Baltimore has for a number of years urged a project of this kind, and has anticipated great commercial benefits from it if carried out. An effort was made in this direction in 1872, and the Maryland Legislature of that year passed an Act incorporating the Maryland and Delaware Ship Canal Company. An attempt was made in 1874 to get from the State of Maryland an appropriation of \$20,000 to make surveys, but it failed. A similar charter to that above mentioned was granted to the same company by the Delaware Legislature about the same time. The charters per-

A PERFECT RESERVOIR.—A writer for the London *Mining Journal* gives a description of what he calls a perfect reservoir. It was constructed for the storage of water near Maidanpek, in Servia, to supersede the use of two steam-engines which were used at the Servian Copper Company's mines—thereby saving a considerable monthly outlay in fuel, labor, etc. It is formed by an embankment, faced by a wide wall, put across a valley. The wall is about 60 feet high, substantially built, and water-proof, backed inside by beaten earth in the usual manner. The sheet of water impounded is about half-a-mile in length, of variable width, at the deepest point 50 feet in depth. The area is about 29 acres; quantity of water, 93,000,000 gallons. It is usual to place the conducting pipe in the center of the embankment. The engineer in this case did not do so, nor use any pipe; but he cut a tunnel into the rock by the side for the discharge of water, through a valve, in a well, which is also the overflow. What I wished to remark on is the very perfect execution of the work. Most reservoirs known to me have been found when first used to be leaky, requiring supplemental expenditure of money—sometimes large sums—to make them perfect retainers of the water; and in many cases the embankments have yielded to the pressure of the water, caus-

LEAVES AND BLOSSOMS OF AUSTRALIAN BLUE GUM, (Eucalyptus Globulus)

mitted the company to start the route of the canal from any point on the Chesapeake bay or its tributaries, from the Sasafas river southward. The route proposed by the company is by way of the Sasafas river, across the peninsula, to the Delaware river. If this route should be adopted it would simply be a rival canal to the Chesapeake and Delaware canal, and would run parallel to it at a distance of not more than 10 miles. The canal, if constructed as proposed, would be 40 feet wide at the bottom, and 60 feet wide at the top, with a depth of 21 feet below low tide. Such a canal would not be a ship-canal; and, it is claimed, would not be of any advantage to Baltimore. The idea of Senator Whyte is to have a canal constructed which will complete an internal water-way to the West and Northwest, and which will accommodate the naval vessels of the United States.

ISTHMUS OF DARIEN CANAL.—It is about 30 years since a ship canal across the Isthmus of Darien was first projected, and at last the United States of Colombia have got so far as to grant a concession to the Inter-oceanic Canal Company, which requires the determination of a plan within three years. A company must be formed within two years afterward, and the work completed within 18 years more. The concession is for 99 years, at the end of which time, in the year 2000 A. D., the property will revert to the Colombia government, provided the individuality of that Republic has not been lost before that time by annexation with the United States of America, or some other progressive nation.

ing great destruction of life and property. In the present case the embankment and wall were put to a very severe test by a flood which occurred about 12 months ago. The stream was such as to bring down trees and shrubs, which shunt up the overflow, thereby causing the water to flow over the then unfinished embankment and wall 18 inches in depth, but without doing the least damage to either. To show the perfection of the wall, etc., I can say that not a drop of water found or finds its way through. It is of great importance to Maidanpek that the embankment should be very secure, because its failure would involve the demolition of nearly the whole of that village, which consists of nearly 400 dwellings.

ANCHORING TIMBERS.—A writer for the *Polytechnic* suggests a way to anchor down timbers on rock. In brief, the plan is to bore the timbers and the rock, and let in a piece of iron gas-tubing the exact size of the hole; the lower end being expanded in the rock by driving it over a double taper-plug, which is put in at first. The upper end is expanded by a taper-plug, and hammered down flush with the timber. "The cheapest way to get them out is to saw them off and leave them in."

EFFECT OF THE EADS JETTIES.—The shipment of wheat direct from Iowa to Liverpool is an interesting fact. An article on page 11, from the *Davenport Gazette*, gives an account of such a shipment, on terms so low as to defy the competition of any other line.

The Eucalyptus as a Honey-Producing Tree.

Our engraving on this page shows the leaves, twigs, blossoms and seed capsules of the *Eucalyptus globulus* or Australian blue gum. There may be seen the two styles of foliage, the wide opposite leaves which come earliest in the growth of the tree and the long, narrow and pointed alternate leaves which appear afterward. There is also shown the beautiful blossoms with its myriad anthers. About the center of the engraving is the seed capsule, one half cut away, so that its internal structure appears, and lower down is one of the capsules turned toward the eye so that one can look into its capacious cup. All these points are of interest, because our Eastern readers who have never seen the tree which they read so much about, may gain a good idea of some of its parts. In this State where the general appearance of the tree is so familiar to all, the engraving will have a special interest, because it is made to represent the points which will be claimed for the tree as a honey producer.

We are indebted to a contributor of the *Press*, who signs himself "U. K. Lyptus," for an interesting statement of the adaptations of the tree to the apiarian, and that which follows is from his pen:

For all this climate is unsurpassed, the Heaven's sometimes, as last year, fail to supply copious rains to insure a sufficient and lasting crop of honey-producing plants. In the great honey-producing counties of this State forest trees from which honey is obtained are wanting. In the Eastern and Western States many of the trees growing in the forest and by the wayside yield an excellent grade of honey. On this coast, and especially in California where trees make such rapid growth, how easy it would be for the apiarian to set out an artificial forest of honey-producing trees.

What will be the best tree to plant that will make a rapid growth, be useful for fuel and building, and above all yield the most honey in our dry climate? We know of many trees that furnish nectar, none of which succeed so well in our State as the eucalyptus family. To give the history and culture of this class of trees in these columns would be unnecessary, for the pages of the *RURAL* for years back go over that ground sufficiently. The subject of the eucalyptus as a honey producer has not been so fully considered.

The different varieties of the gum bloom at such times when all other kinds of flowers are out of season, and the more so during a dry year when the crop of honey-bearing animals is cut off. The *Eucalyptus globulus* commences to yield nectar about the middle of December, and continues to do so for about five months. During that time the bees seem almost to swarm upon it. It is perfectly astonishing to hear the industrious insects in the very middle of winter merrily humming their gentle tune at a dizzy height amid the swaying branches of some tall gum tree. There can be seen the beautiful yellow-banded Italian and the dusky black, also the white or silvery albino, a hybrid, perhaps a bumble bee, with also a yellow jacket, each and all peacefully drinking out of the same cup. Did any one ever see such warlike "creatures" of different "castes" gathered together so sociably for the one purpose? What other plant or tree could be set out that would offer such friendly shelter and "commercial" inducements to the insect world? Not only do bees find "pastures new and fresh" in this tree, but ants and butterflies participate in the grand open-air banquet. Birds also find an agreeable shelter in the pendant branches of the tree. We would have said a peaceful and fragrant pleasure would be their lot; but, as we have learned from a friend in Los Angeles, the little humming bird will not venture near a tree while in bloom, for the bees will not tolerate any of the feathery tribe on or about it. Woe to the bird that will be so presumptuous as to attempt to alight on its branches. A dozen, nay, a hundred well-poisoned darts will at once be dispatched to slay the intruder. We have found that in a year of plenty bees when at work are not so apt to molest birds when seeking shelter in the foliage of this tree.

The second variety of eucalypti to be considered is what is known as *rostrata* or *iminalis*, or more commonly called red gum. This blooms from the middle of August to about the second or third week of December. It is undoubtedly the most important of the lot, for it comes in at a time when other flowers are scarce, if not disappeared altogether. The bee finds abundant nectar in its flowers to keep them from starvation. The tree is of rapid growth; flowers small and numerous.

Another variety of eucalypti of the iron bark species, of slow growth and flowers twice a year, is sought after by the honey bee. It blooms in June and a second time near the end of December. A fourth variety blooms from July to September, and November to January; but as the tree is slow in making any headway it is not to be recommended for planting by the beekeeper.

Many more desirable kinds of eucalypti are enumerated in the catalogues and works on Australian plants. So far, out of the many kinds successfully introduced into this State, the above are the best suited to the wants of the bee master.

The honey obtained from the eucalyptus is "highly" aromatic, and is said by trustworthy

persons to possess medicinal virtues. It is dark in color, fragrant and a little peppery to the taste. On the whole it will, for its rich dark color and medicinal properties, always find a ready sale. Prof. A. J. King, of the *Beekeepers' Magazine*, in acknowledging the receipt of a sample of honey gathered from the *E. globulus* during the month of December, 1876, and sent to him by the writer, says that "it resembles, in many respects, the honey accompanying the queens we receive from the region of the Alps in Italy." He also mentions the peculiarities of the honey as given above.

Australia furnishes the best illustration of the great productiveness of the gum as a honey-yielding tree. In that country and adjacent islands there are about 100 species of this tree. They constitute 99 of the forest vegetation. The native bees of Australia, as well as the imported, which have multiplied rapidly, take up their abode in the hollow trunks and branches of the trees and gather large quantities of delicious honey from the eucalyptus. A swarm never dies there for the want of provisions; there is an unlimited supply always ready to be collected.

We know of no tree that yields nectar in greater quantities. Hives that were most emptied by the first of December have been by an industrious colony filled to overflowing by the first of January.

In order to collect the honey from the winter-flowering eucalyptus it is necessary that there should be a strong swarm in the hive. To maintain this it is not only expedient to have plenty of honey but also a good prolific queen and a fair supply of bee-bread or pollen. All bee-bread required for brood-rearing can be obtained from any of the varieties named. It partakes of the color of the flower and is gathered by the bees in the early part of the day.

Bees can be noticed working on this tree at all seasons; even on and after a light shower of rain or when a heavy fog has cleared away, the ever industrious bee can be heard away up amid the fragrant blossoms of the eucalyptus. This shows that a change in the weather makes none in the flow of sweets, and that the industrious insects (ants not excepted), always have an opportunity to be busy, rain or shine.

A very interesting incident illustrative of the partiality insects have for this honey has been noticed by us. Prior to the time of the blooming of the gums, under and around the dwelling house, were to be seen thousands of ants. They congregated under everything. Even the inside of the house was infested with this troublesome pest. Just then the *E. rostrata* opened its flowers, and when this tree was found by the little ants to be in bloom they deserted the house and everything about it and transported themselves to the base of the various red gum trees about the place. There they took up their harbor in the cracks in the ground. From that time a black streak could be seen extending up the side of each tree in flower. Ants were climbing up unloaded, while, going in the opposite direction, they were coming down weighted with nectar taken from the greatest honey challenge known among the bee-flora.

In addition to the honey yield of the blossoms, the eucalyptus will serve the apiarian as a wind break; it will furnish him fuel and lumber for hives, stands, boxes and buildings. The dried leaves furnish excellent fumes to the smoker.

We have satisfied ourselves that the eucalyptus is indispensable around an apiary, and we hope others will investigate the matter to their own satisfaction.

Sensations on High Altitudes.

To those in the enjoyment of ordinary health, says the *Rocky Mountain Tourist*, the sensation experienced in crossing the ascending elevations of the great plains and in the higher altitudes at the base of and within the mountain, are, in a notable degree, pleasant. The dryness and rarity of the atmosphere, together with its remarkable electrical effects combined with numerous other peculiarities of climate, excite the nervous system to a high degree of tension. The physical functions are aroused and re-energized, it may be even after years of sluggish, inefficient action. New vigor and tone is imparted, the appetite is keen, the digestion is capable and strong, and the sleep sound. The vital organs, stimulated and compelled from an established routine of greater or less inefficiency, it results that all those lurking ailments to which men in the ordinary pursuits of civilized life are too much subject, at once disappear, and whatever there is to each individual of capacity to enjoy is summoned into fullest action, and one fairly revels in the intoxication of good health. Such are the sensations accompanying the first entrance into the rarified electrical air of these elevated regions, which, with their attending pleasures and benefits, will forever render the Rocky mountains a resort of unequalled allurements for those who, not invalids, yet seek relief from the exhaustion and deterioration of overworked professional or business life.

GOING FOR THE RED MEN.—Every indication now seems to point to a large expedition to the north this season on an Indian hunt. General Crook is a man who keeps his projected movements to himself; but the opinion of military men is that the coming season will witness a large force sent into the field, the abandonment of several old, unnecessary posts, and the establishment of several new ones at more exposed points on the frontier. —*Laramie Sentinel*.

Useful Information.

The Paris Exhibition.

The French International Exhibition of 1878 was inaugurated by President MacMahon on Wednesday, May 1st, with an *éclat* which has given joy to the Parisian heart and has chastened the opponents of the Republic in proportion as it has afforded felicity to its upholders. Every way the opening was auspicious, and the response of the nations invited to exhibit has been so cordial that success is assured, should no untoward calamity appear to frustrate the efforts of the promoters. In consequence of the unexpected demand for space, the area originally contemplated for the exhibition has had to be increased by one-half. The time taken to construct the buildings and arrange the exhibits, so far as they were arranged by the opening day—and that was an appreciable way from completion—was 20 months. The last exhibition, that of 1867, occupied the same site as the present one, but it only extended over the Champ de Mars, on the left bank of the Seine. The Trocadero was not utilized. This time, however, that slope on the right bank has been turned to account by the erection of the Trocadero Palace, which consists of an immense concert-hall, with wings extending on both sides, in a free imitation of the Roman architecture of the eleventh and twelfth centuries. The concert-hall is flanked by two towers, the summits of which will be the highest points in Paris. The mid-building, the bulkiness of which the high flanking towers serve to tone down, is surmounted by an elegant bronze figure of "Victory," with expanded wings and drapery raised by the wind, the work of M. Antonin Mercie. The concert-hall is 30 meters in diameter and is estimated to seat 6,000 persons. On the outside the Palace of the Trocadero is adorned by a cascade of water falling from a height of 26 or 30 feet into an ornamental lake, round which extend the elegantly laid-out grounds, in which figure many striking sculptures by well-known artists. This vast building and its grounds will survive the exhibition. As to the Exhibition proper, a temporary building in the Champ de Mars, on the 1867 site, it is approached from the Trocadero by the Point de Jena, which has been widened and extended so as not to interfere with the ordinary traffic. In front of it are beds of rhododendrons, grass plots, statues, fountains and conservatories. The terrace is 280 meters in length by 20 in width. At intervals are placed gigantic sculptural figures, symbolizing the principal participants in the exhibition. There are three porticoes. The central one leads to the grand vestibule, the right side of which is allotted to England, and left to France. The main avenue is devoted to works of art, the exhibits of the Paris Municipality occupying the center of the building and the French crown jewels being placed at the southern extremity. As to the arrangement of the groups, the visitor desirous of comparing the production of different countries in a particular class, will not have, as in 1867, to make a circular march, but will have to proceed longitudinally. The eastern avenues are assigned to French machinery and French productions, the western to foreign productions and foreign machinery; but the machinery has overflowed into a number of annexes. Each nation has been allowed its own architecture inside the building, the result being a great variety of styles. The English erections occupy a much larger space than that placed at the disposal of any other foreign State.

WASHING WINDOWS.—It is not an easy thing to wash windows so that they will look clear and well polished, and if soap-suds are used, it is quite impossible to do it. The old-fashioned way of taking out all the windows, and washing them in soap-suds, and setting them aside to dry, after the suds have been rinsed off, is, to be sure, the easiest way of cleaning them, but it is also the worst way to make them look clear and bright. First brush them off well with a sponge or brush that comes for the purpose, and then wrap a bit of cloth about a sharp-pointed stick, and wipe out the dust that adheres to the corners, then take some weak tea, boiling hot, and add to it a tablespoonful of alcohol and a few drops of aqua ammonia, or a bit of carbonate of ammonia, the size of an English walnut. Dip a piece of sponge or old flannel, or of old cotton flannel, into it, and rub the glass one way only until it shines clear. Wipe it off with another cloth, rubbing it until well polished. Newspapers used to be much better than any cotton cloth for washing and wiping windows and mirrors, but now that the paper is chiefly composed of wood pulp, they are the worst things that can be used, as they cover them with a linty substance.

TO WASH GREASY WOOL.—Dissolve a large tablespoonful of borax in pint of boiling water. Mix one-quarter of it in the water in which the wool is to be washed. Put in one piece of goods at a time, using soap if needed, and if necessary add more of the borax water. Wash well and rinse in cold water, or in water only slightly warmed. Shake well, and hang where the goods will dry quickly. For 26 years I have used for washing my white flannels water about as hot as would be used for cotton clothing. My flannels are beautifully soft as well as white. I never have any shrink.

DRY PLATE DEVELOPER.—Our photographers may be interested in some statements made by M. Queval in the *Bulletin Belge*: When a dry plate is coated with a preservative principally or entirely consisting of gallic acid, it can be rapidly developed by the following solution: Distilled water, 100 c. c.; crystallized silver nitrate, 4 grammes; acetic acid, 4 grammes. Place the plate, film downwards, in a trough of rain water, so as to moisten the whole of the film without unequally removing the preservative, then pour all over it the above solution; the picture will quickly appear, and will generally be quickly developed. It must be carefully watched, and washed as soon as it seems to be sufficiently intense. All photographers who are in the habit of developing dry plates have observed that when too much silver nitrate has been added to the developer, the intense blacks of the negatives were riddled with small holes. The formula which I have given above does not produce this result, even though the proportion of nitrate be much larger; the reason of this apparent paradox I am not in a position to explain. I have only tried this developer with stereoscopic positives on albumen or albumenized collodion, and I am bound to add that I have obtained very unequal results. I therefore introduce it to public notice with some hesitation, though I believe that by washing off the preservative and by modifying the proportion of the ingredients, a very rapid and energetic development will be obtained.

TO RESTORE OLD, FADED AND ILLEGIBLE WRITING.—The restoration of writing that has become faded and illegible can be accomplished quite satisfactorily, where the ink employed has been an iron ink, by one or the other of the following methods, which are suggested by V. Bibra: Moisten the paper or parchment with a solution of sulphide of ammonium, applied best by means of a brush. Remove the surplus sulphide by rinsing it in water, and dry the document by pressure between sheets of absorbent paper. Writing restored in this manner, however, is disposed to fade again after the lapse of several weeks. A better plan, recommended by the same writer, is to apply, in the same manner as above, a concentrated tannin solution, which is then to be removed by washing in water, and the document dried as before. Writings thus restored show no disposition to lose their intensity for a number of months. The above recipes, are of course, only applicable to iron inks.

GOOD HEALTH.

The Treatment of Bleeding Wounds.

It is now a time of especial activity in the use of machinery and edge tools, both in the shops and on the farm. A few words about the treatment of wounds may be valuable. Dr. C. H. Allen makes the following suggestions: Bleeding is attended with more or less danger. All should observe the difference between arterial and venous hemorrhage. If the blood flowing from a wound is of a bright color and jets out, it shows that an artery, leading blood directly from the heart, has been wounded, and should receive instant attention, lest the sufferer should bleed to death. If the artery be very small, compress it firmly, and it may contract upon itself and the bleeding cease. But it should not be left without a continuous pressure in some form, either directly upon the tube or above it. The usual way is to bring a strip of linen or cotton cloth tightly above the limb till the bleeding stops. The artery may be larger and then the same treatment may be proper, till a surgeon may seize it with a pair of forceps, draw it out and pass around it a strong thread, or ligature of waxed twine or silk. A cut artery can never be absolutely safe unless a ligature has been securely tied. The mode of tying a ligature is of some importance. The ends of the threads should be passed around each other twice, and then drawn tightly. This prevents slipping of the thread, and secures a complete check to the flowing of blood. These directions are important, because the life of the wounded person often depends upon the prompt and proper application of a ligature. In every agricultural school instructions on the proper mode of treating all sorts of wounds should be given. And every man who uses instruments should be familiar with the proper way of dressing wounds instruments may possibly inflict. The most cautious men are now and then careless in using sharp-edged tools. A young man was mowing. He unintentionally disturbed a nest of hornets. They returned the compliment by addressing him in a pointed way. He stumbled, and inflicted a wide and deep wound upon the calf of his right leg. His brother, then present, tore his shirt into strips, tied knots in the middle and brought some about the leg above the knee, bringing the knots under the knee more and more firmly, till the hemorrhage ceased. Two other men were mowing, when one carelessly hit the other with his scythe just above the inner ankle. The blood jetted out freely. The inflictor of the wound ran for help, and on his return found the wounded man had bled to death. Very slight pressure upon the bleeding artery might have saved his life. When one can, press the bleeding artery against the bone above the wound. The services of a surgeon are desirable, but an hour may elapse before he can reach the wounded person, so every one

should be familiar with the simplest way of checking the bleeding from a wound.

If the blood flowing from a wound be dark colored, oozing slowly in a steady stream, but not jetting, as when an artery has been cut, it can easily be checked in the same way. Bleeding from a vein may cease by applying cold water, by holding the injured limb higher than the head. If the lower limbs be cut severely and the blood flow freely, place the sufferer on the ground or floor, raise the limbs upon a chair, apply a bandage firmly about the limb or limbs, and keep it saturated with cold water. By observing these directions many lives have been saved.

We have seen friends, upon receiving a severe cut use a large quantity of rags, as if concealing the blood was stopping it. The compression of knots brought firmly against the bleeding artery just above the wound is worth all the rags of the known world.

The Preservation of the Voice.

In a recent lecture, in New York, on the "Hygiene of the Voice," Dr. Ward said that there are many agents which more or less influence the voice, the four principles of which are climate, dress, diet and exercise. Change of climate will undoubtedly for a time exert some slight deleterious influence on the larynx, but this influence is greatly overestimated. All clothing should be loosely attached to the body. The present fashionable style of dress is decidedly unhealthy. The chest and abdomen are unnaturally confined, the lungs and other organs thus being prevented from acting in a normal manner. The dress should be worn high in the neck, and the sensible female artists avoids as much as possible appearing on the stage in full dress. The throat should not be wrapped in comforters, hoas, etc., chest protectors should not be worn and the feet should be guarded against wet. Food supplies nourishment and warmth, and the article of diet which has the special property of producing heat in the body is fat. The diet of the singer should be bland as well as nutritious. Of the different kinds of meat, venison, turkey, roast beef and lamb are the easiest to digest. Cooked vegetables, unless too highly seasoned, are easily digested; cut cabbage, cucumbers and such like should be avoided. Pastry should be invariably discarded. Dinner at noon, followed by a light tea at nightfall, is a rule which, if rigidly adhered to, will be a safeguard against all ordinary attacks of indigestion. In order that acts of singing be properly performed, it is absolutely necessary that the stomach be nearly empty. Alcoholic beverages should not on any consideration be indulged in by vocal artists.

For the proper development of the vocal chords there are several rules which must be observed. The exercises must be regularly and systematically practiced; they must always be within the register; they should never be pushed to the point of fatigue; they should never be made use of when the vocal organs are attacked by cold, no matter how slight, and they should be practiced while standing upright, so as to allow of free play of the lungs and accessory vocal organs. Bodily exercise is especially beneficial to the singer. In concluding his lecture, Dr. W. said that learning to sing correctly is learning to be healthy.

The Causes of Sleep.

What are we to say as to the cause of sleep? It is very easy to catalogue the predisposing causes of sleep, but most difficult to speak with confidence concerning the direct ones. The first and most general predisposing cause of sleep is a negative one. It consists in the absence of everything that stimulates the senses or oppresses the mind. Darkness or the absence of light, silence or the absence of noise, repose or the absence of muscular exertion, all help to bring on sleep. To some it may seem strange that continuous noise acts like quiet. The truth is that the monotonous repetition of stimuli to the senses produces a level uniformity of impression which is practically for soporific purposes, equivalent to the absence of impression altogether. In this way the influence of a monotonous chant or lullaby, the "hush-a-bye baby" of the nursery, the murmur of the waves, the "sough" of wind through the branches of trees, and the dull roar of machinery in predisposing to sleep may be explained. Sameness of impression also acts in a manner which bears on the operation of another great predisposing cause of sleep—namely, freedom from mental oppressions or activity. It neutralizes the self-consciousness of the mind, by making it cease to think of its own operations. Dr. Carpenter, for example, points out that even when the mind is, by an act of will, directed to the contemplation or evolution of monotonous impressions the effect is the production of sleepiness. He cites as an example a well-known popular remedy amongst scholars for sleeplessness—namely, the automatic repetition of the tenses of a Greek verb. No doubt if a man is troubled by some exciting anxiety which would keep him awake, owing to the hurrying crowd of disturbing fears that it might engender in his mind, he will probably find it difficult, if not impossible, to bring on sleep. But if by an act of will he can transfer his attention to a dull monotonous train of harmless ideas—e. g., many sermons and most poems—he will, by a process of self-quietization, place himself under the operation of a predisposing cause of sleep.—*Science for All*.

The Week.

Among local events the great Musical Jubilee or May Festival has largely engrossed public attention the past week. The attendance at the Mechanics' Pavilion in this city, where the performance came off, has been large, not less than 10,000 people being present, the festival having proved both a pecuniary and a professional success.

The yield from the California gold mines continues without abatement, water being still in ample supply—the whole mining population exerting themselves diligently the while to make the most of it, so long as it lasts. The amount of gold produced by the hydraulic operators will this season be large beyond precedent. From the gulches and elevated diggings there will also be gathered more gold dust than has rewarded labor in these localities for many years past. As a whole the mining communities of California have been well prospered thus far the present season. With our other industrial classes also times are growing somewhat easier, the country demand having absorbed much of the excessive labor that had accumulated in the city. In the latter, too, there has been of late a little more call for work through a slight increase of building and some improvement in our local industries. There are yet, however, many unemployed or poorly paid people in the city, being those not fitted for the performance of harvest work or other severe out-door labor. Decoration Day was observed in this city by a general suspension of business and the performance of appropriate ceremonies. The weather the past week has been much of the time cold and lowering, but generally favorable to the maturing and gathering of the crops, as well also as to the prosecution of mining and our other leading interests.

Mining—How it is Carried on.

Mining at best is a chequered business. There is at least one blank for every prize. And it has been so from the first. There were disappointment and failures while the placers of California were yet in a virgin state. Men packed their blankets out of the mines in '49, satisfied that they would no longer pay wages. The army of the "dead-broke" began to muster even that early. There were tramps in those days—luckless, spiritless, worthless wights—just as there are now. There were feeble, inefficient persons who could not, and vagabonds who would not work, mining having always been afflicted with its full share of the incompetents and drones. But not in these has it found its greatest drawbacks. Paradoxical as it may seem, it has suffered most from men of opposite tendencies—from the slashing, go-ahead fellows—who, visionary, careless and wasteful have so often defeated their own endeavors, and dissipated what the more prudent and frugal had gained. And to this day we have found no sufficient corrective for this evil. After all we have suffered and lost we will not go about mining as we do about every other kind of business.

If a man having too little money would start a bog ranch, he finds another who has some funds, and forming a partnership they two carry on the porcine establishment with as little noise as circumstances will permit. The same when two or three men conclude to embark in lumber-making, they associate themselves together, put up a saw-mill, and run it as quietly as possible. And so of the whole round of industries till we come to mining, which has to be conducted in a way altogether different. For carrying on this, however small the enterprise, a company, with a Board of Directors and a Secretary, must be incorporated. An office must be hired and furnished. A set of books must be provided; always one for recording assessments and another for containing the blank certificates of shares, which certificates are usually embellished with some significant device, as a miner delving with a pick, to show that the hard work of the concern is to be mostly done on paper, or, a goddess of liberty, symbolical of the freedom with which the directors shall be permitted to embezzle the corporate funds. What use is made of this machine in a majority of cases is well enough known. Where one of these incorporated companies has ever achieved a marked and permanent success, a hundred have yielded up the ghost after a short and unprofitable career or survived only to filch money from the pockets of the shareholders. Of the losses incurred through stock gambling, nothing in this connection need be said.

In regard to the latter, it is certainly time it were purged of its more palpable and long-standing abuses. Rightly pursued, mining for the precious metals on this coast ought to be the safest and best paying industry in which our people could engage. Our mineral territory is rich in this class of deposits and of almost illimitable extent. The mines are open to all. They have not been and never can be monopolized to an injurious extent. The natural facilities for prosecuting the business are generally good. It is a healthful, manly occupation, incapable of being overdone or excessively crowded. For its products there is always a cash market. It never suffers from competition. Where rightly undertaken and prudently carried on, it is attended with as little uncertainty as most other callings. With so many advantages in its favor, it ought to have been far more successful than it has been. What makes failure here the more inexcusable is the fact that they might and should have been avoided.

The first thing to be done in correcting past mistakes is the observance of greater economy both at the outset and in current expenses. The substitution of limited partnerships or mere associations might in many cases be substituted for incorporated companies. For the management of every enterprise a man of practical experience should be selected; the practice of appointing persons to these positions merely out of considerations of friendship or to oblige some member of a company, being a very bad one. The plan of letting out work by contract, where practicable, has generally been found to work well. Companies or parties owning properties that are likely to prove lasting should erect comfortable dwellings for their workmen, as by this means they will draw into their service men of families, who, besides being more permanent and reliable, are more apt to take an interest in the business of their employers. This, too, by reducing the cost of living to the laborer, enables him to work for less wages, being at the same time more comfortable and independent. In some parts of California where mine proprietors have pursued this policy pleasant hamlets with a large youthful and a contented adult population have grown up about their works. After a time the workmen are apt to buy these dwellings with the ground about them, and feeling settled, begin to plant their places with trees, cultivate gardens and finally make for themselves handsome homessteads.

As to our boys, let them be turned out into the mines and there set to work earning a livelihood. It may be a little rough on them at first, but once they get used to it they will come to like the business.

The San Elizario Murders.

The persistence and earnestness with which the press of New Mexico and Western Texas continues to comment on the San Elizario massacre, evinces how deep is the public feeling in those sections of country in regard to that matter. This butchery took place now some five months ago, and yet the people and the press off that way seem as much alive to the subject as if it were an event of recent occurrence. That these cruel murders should have aroused general indignation at first is not at all strange, but that this feeling, instead of abating, should, with the lapse of time, have grown more intense, denotes how deep a hold it has taken on the popular heart and how very likely it will be to eventuate in serious trouble unless proper measures be taken to allay it. Indeed, there is little doubt the American residents, supported by the better class of native-born Mexicans, would long ago have proceeded to avenge this most atrocious crime, had not the public authorities, taking it upon themselves, promised to visit the guilty parties with condign and speedy punishment.

In pursuance of such purpose, a commission of three was appointed by the President and the Governor of Texas to investigate and report upon this horror. What may have been the exact finding of these commissioners, if any report has been made by them, has not publicly transpired. With the delay and uncertainty attending their action, the citizens of El Paso have grown restive, the whole look of the business seeming to them not at all reassuring; hence, this growing discontent and a revival of the excitement, that the hope of vigorous measures on the part of the commission had for a time partially abated.

If now the government expects, through the adoption of a non-committal and temporizing policy, to repress this excitement, or, through mere promises, to appease these well-founded demands for justice, it is preparing the way for a disappointment. These bordermen do not like to dispose of injuries of this kind in that way. To an open and manly foe they are apt to be forgiving and generous; to the cruel and cowardly, exacting and implacable. "Remember the Alamo"—how wildly that war slogan fired the Texan heart! In her struggle for independence, it was worth to the "Lone Star" State more than 10,000 armed men. It will be a sad day for the banded assassins on either side of the border, if ever the avengers of this most recent and most dastardly of all these frontier murders, shall raise the cry of "Remember San Elizario." If once breathed it will be the death note of many of them. If these treacherous assassins or the authorities, American or Mexican, flatter themselves that crimes of this kind can be committed without provoking retaliation or notice, they will in good time be disabused of this notion. The best way and the cheapest in the end is to thoroughly and impartially investigate these offenses and bring the guilty promptly to justice. Unless redressed in a public way, these will come to be considered private grievances, causing individuals to be forever seeking for retribution.

The circumstances attending this massacre were of the most aggravated kind, being briefly as follows: Judge Howard, an American citizen, a resident of San Elizario in El Paso county, Texas, having taken up certain salt marshes that had before been open to the use of the Mexican population in the vicinity, these people determined upon taking his life, to which end they collected at the above town in December last to the number of several hundred, coming from both sides of the Rio Grande, and commenced an attack upon Howard and his friends, who sought shelter in an adobe building, which they barricaded and thus kept their assailants at bay. On a promise from the mob, solemnized by the sacred oaths of their leaders, that their lives should be spared, the besieged consented to a surrender. No sooner had they done this, however, than three of their number, Judge Howard, John G. Atkinson and a man named McBride, were seized by the cowardly and treacherous miscreants, and shot in cold blood. This accomplished, the crowd proceeded to plunder the houses and stores of the murdered men, despoiling them even to the clothes they wore. Atkinson, before the shooting took place, had given up to the fiends the sum of \$11,000 that he had about him, on condition that they would release him and his companions. Charles E. Ellis, an old resident in the place, was lassoed, after which his throat was cut and the body thrown into a well, simply because he sought by kindly words to divert the murderers from their purpose before the bloody work commenced.

These men so ruthlessly butchered were all honorable, law-abiding American citizens, their good character being amply vouched for by the people among whom they lived. Concerning one of the victims of this enormity, John G. Atkinson, the writer can say of personal knowledge that he was a young man of fine character and very superior parts. We have been conversant with his history from childhood up, and can honestly say it was without spot or blemish. We might search among 10,000 of our California youth and hardly find one so exemplary in all the walks and relations of life as he. Brave, truthful and industrious, he educated himself by his own efforts and won the confidence and esteem of all who knew him. What at the outbreak of the late civil strife

the county called for soldiers, he was among the first to respond, having served long and well and received honorable wounds in the cause of the Union. As a partial reward for this service he was appointed to several positions of trust under the Government, in the discharge of which he was carried to that remote section of the republic, where he was basely and cruelly robbed of his life. Let the Government see to it that his murderers are punished and that proper reparation be made for the property of which he was despoiled.

Prof. Joseph Henry.

We have already mentioned the death of Prof. Henry, for years Secretary of the Smithsonian Institution. Prof. Henry was born in Albany, N. Y., in 1797. He was educated in that city and became Professor of Mathematics at the Albany Academy, at which place he did much of the work which rendered the electric telegraph possible. From this position he was called by the Government at Washington to assume direction of the Smithsonian fund. This was a large sum of money left by James Smithson to Congress "for the advancement and diffusion of knowledge." Left as it was in such a way, there were many chances that it would be diverted from its original purpose or at least unwisely expended. To the broad-minded policy and the perfect integrity of character of Prof. Henry, science owes a great debt of gratitude. For no one who is familiar with the work that has been done by the Smithsonian Institution, in the way of encouraging original research and in diffusing scientific knowledge, can deny that he has accomplished the purpose of its liberal founder. We only hope that the Lick trusts may be as wisely administered.

In the capacity of Secretary Prof. Henry did much good work in getting into operation the Signal Service, also in investigating the best methods of making fog signals for our lighthouse service. His name appears almost constantly in the scientific publications of America for the last 50 years, and his pen will be greatly missed in the future. Personally, Prof. Henry was of fine physique. He had a commanding figure and a noble intellectual face. He has been well called the Nestor of American Science. In his own social circle he was a most interesting man. He lived his last years in Washington with his three charming daughters, and the intellectual atmosphere of his home formed an agreeable contrast to the prevailing tone of society there. He was witty and could tell a good story as well as enjoy one better than most men. Withal he was a man of most uncompromising integrity. He hated shams, whether scientific or otherwise.

Professional Courtesy.

As the industries of Germany are not to be represented at the Paris Exposition, the Society of German Engineers have invited each of our mining engineers as may visit the French capital to come on to Germany and make an inspection of the mines, iron works, factories and other industrial establishments of that country, provision having been made by the public officials and directors of these various industries for facilitating that object. In tendering this invitation to their professional brethren on this side, these Germans allude to the courtesies extended them at the Philadelphia Exhibition, in terms expressive of their appreciation of these friendly acts, and a desire to reciprocate the same. That some of our American engineers will afford them an opportunity to gratify this desire is not unlikely, as there ought to be a great deal in the mines and work shops of the "Fatherland" to attract the profession, aside from these hospitalities so kindly tendered. In the expectation that such will be the case, the Minister of Commerce has directed, that technical works and maps in the Library of the Royal Mining Academy at Berlin, be open for the inspection of American visitors.

The Society of Civil Engineers of France have taken similar action in regard to the members of the American Institute of Mining Engineers, opening to them their rooms in Paris with privilege of their library and a hall for conversation, study, general meetings, etc., all of which will doubtless be gladly availed of and duly appreciated by such members of the Institute as may visit the great exposition.

THE MUSICAL FESTIVAL.—The great May Festival took place this week and was a decided success, the attendance being large and the audience appreciative. The building is not well adapted to the purpose, being rather large and bar-like even for the immense orchestra and chorus, while the solo singers failed to fill it even with their utmost exertions. Aside from this, however, Manager Bugbee may congratulate himself on the success of the undertaking, which has been not only a matter of great interest to the music-loving public, but to the whole community. Large delegations from the interior have been present, and all seemed to thoroughly enjoy the entertainment. We hope something of the kind will be arranged every year, if for no other purpose than to encourage and foster a love of music among our young people.

Our Electrical Industry.

Its Application to Mining.

What a proud pleasure it would be to the pioneers of electrical science could they but see the applications almost innumerable of their brilliant discoveries. Such men as Franklin, Arago and Faraday spent years of their lives in the study of the then almost unknown force, electricity. Not a thought had they but the pursuit of truth for its own sake, and yet see the results practical, in the narrowest sense of the word, that have come from their labors. Let any one spend, as we did the other day, a morning in the workshop of the Electrical Construction and Maintenance Company, and then say whether or not the study of pure science is of any practical good to humanity.

In the short space of a newspaper article it is difficult to give an idea of what is being done in this direction by men skilled in all that art and science can do to chain this wonderful force and render it obedient to our will. It is really worth the while for any one engaged in almost any business or pursuit to see for himself what he can find here to help him in carrying out his work. It would astound many to see how much is being done. Here in San Francisco has quietly grown up an industry which keeps pace with the latest developments of the science. Let a man in the remotest part of the civilized world give birth to some new combination of forces, and here on the very outposts of civilization, like Minerva full armed from the train of Jove, his invention springs into life.

There is not an application to which electricity can be put but what this enterprising body of men are ready to carry into execution. They manufacture all the necessary batteries, Grove, Bunsen, Daniell, and construct batteries of all kinds. The various telegraphic apparatus, that of Morse, the various automatic arrangements, telephones, burglar alarms, American District boxes, etc., are manufactured and kept ready for use. Besides they take contracts for the construction and equipment of all kinds of telegraphic and telephone lines.

They have nearly finished a very beautiful piece of apparatus for the San Francisco Fire Alarm Department. It is for the purpose of repeating the signals when required. In such moments of excitement it is no uncommon thing for the operator to send out the wrong signal when it is done by hand. But here the apparatus, when once set, an operation in which it is almost impossible to make a mistake, works automatically until the whole alarm has been repeated with perfectly measured strokes four times.

They are also putting into the New City Hall a set of 63 electric clocks, all run by a very simple and beautiful arrangement by a single pendulum.

Their arrangements for plating gold, silver, copper and nickel seem very complete, and the work seems to be very well done. The company owes much of its success to the labors of the well-known electrical engineer, Mr. S. D. Field, and to the foreman of the works, Mr. Syler.

Some interesting applications of

Electricity in Mining

Suggest themselves as worth the consideration of our readers. The telephone is here almost invaluable. As it appears in its latest forms, it is not necessary to use any battery in connection with it, as there is a bell attachment, rung by magneto-electricity, which signals the hearer at a distance of 100 feet. This improvement renders it perfectly adapted to mining work, since it is the simplest and at the same time the most perfect method of communicating at a distance yet known. It is also well adapted to use on the long extent of ditching in connection with hydraulic claims. Several have been ordered; notably, on the North Bloomfield and the South Yuba. Another very simple and useful method of sending signals (from lines of ditching) is by means of the American District Telegraph Company's Box, which has already been described in the pages of the PRESS. There are 12 signals which can be sent by each box, and in addition each box records itself by number at the central office. Now, if it be agreed beforehand that the signals in any certain order he taken to mean, e. g.: 1. No water. 2. Break in ditch. 3. Watchman going east. 4. Watchman going west. 5. Slide. 6. Send help. 7. Heavy rain, etc. Such signals can be sent from stations upon a line 100 miles long, and, as each box locates itself, the point at which assistance is needed is known at once.

Another useful little apparatus is the "watchman's clock." This little arrangement runs by clockwork and is so arranged that the watchman carries with him his own monitor, which never sleeps, is not open to bribery, and records with perfect exactness his performance of his duty at the exact time or his failure to do so.

A very useful application of electricity is the electric light. This is useful in all engineering work which has to be carried on at night. For example, to hydraulic miners again who can work often only through part of the year, when water is abundant, it is of the greatest importance that the night work be as effectively done as in the day time. There is no way of effecting this so economically as by means of the electric light. The current of electricity can be generated by revolving the armatures of a

magnet, the intensity of current being regulated only by the strength of the magnet, and the speed of the revolution. In hydraulic claims this can be done by water-power, which of course is here abundant, and so that the electric light will, except for the first expense for the apparatus, cost simply nothing.

It has always struck us as curious that our miners, quick as they usually are to avail themselves of new ideas, have been so slow to take advantage of the wonderful facilities which are given them by this new agent. Perhaps it may have been from their ignorance as to whom to consult in this matter.

We think it time that some of these labor-saving devices were in still more general use upon this coast, while we are glad to see that there is enterprise enough among our practical mechanics and our capitalists as well, to take hold of a new science and reap from it such a harvest for their own benefit and that of the community.

Widney's Patent Transplanter.

Gardeners and tree-planters have heretofore been disappointed in the use of tools made expressly for transplanting plants and shrubs, and we should not be inclined to devote our time and space to the invention which forms the subject of this article if we were not, after

WIDNEY'S PATENT TRANSPLANTER.

well considering its merits, satisfied that it will prove a desirable article for persons who have many small trees or plants to transplant. One important reason for its success over all its predecessors lies in the fact that its work is better done than it can be accomplished by the most careful hand work. Plants transferred by its agency are more certain of life, and there is less interruption or interference in the course of their growth.

Although positively a labor-saving apparatus,

GEOGRAPHICAL LOCATION OF BODIE AND ESMERALDA DISTRICTS.

we consider a greater value rests in the superiority of its work. The invention is fully described by the patentee, R. M. Widney, of Los Angeles, as follows:

The Object to be Accomplished.

The object of the transplanter is to take up the plant with a solid plug of earth around the roots undisturbed, and resetting the same in a hole, around which hole the ground is undisturbed and ready to receive and nourish the young roots, thus leaving the plant in as near its natural growing condition as possible.

How it is Done.

The transplanter, A, is first used to cut a hole, D, in the ground or in a box of dirt, where you want to set the plant. Next the transplanter is set down over the plant so that the top of the plant runs up inside of the inside cylinder, B. The outer cylinder is then pressed down into the ground, giving it a slight rotary motion, until you have cut to the depth desired, generally two or four inches. (In pressing down on the handles, care must be taken to keep the hands off from the inside cylinder, which must be left loose so as to move freely.) The rotary motion gives a sharp drawing cut.

After cutting down around the plant to the depth desired, lift the transplanter out of the

ground. It will bring up the plant with a solid plug of earth, C, inside the cylinder. Now put the transplanter containing the plant into the hole in the ground (or box) first cut. Set it down to the bottom of the hole so that the bottom of the plug of earth rests on the bottom of the hole; place the two thumbs on top of the inside cylinder, retaining the hold on the handles with the fingers, and close the hand, thus drawing up the outside cylinder while the inside cylinder thus holds the plug of dirt in the hole. The plug of dirt is thus forced out of the transplanter as the wad is forced out of a pop-gun. When this is done, the plant with a solid plug of earth, C, will be left in a hole surrounded by unmoved dirt. Pour a trifle of water around the plant, which runs loose earth into the little crevices around the plug, and the work is completed. After a few experiments the work can be performed with great rapidity.

The object of the outside cylinder is to cut down into the ground and take up a plug of earth. The object of the inside cylinder is to force that plug out.

What the Transplanter has Done.

Mr. Widney has put his transplanter to careful tests to prove its efficiency, and has secured the aid of his neighbors in making trials of it. He writes as follows: "Some three years ago I commenced to set out some 200 acres of eucalyptus trees. I raised the plants and put them in boxes, 20x24, set-

Bodie and Esmeralda Districts.

We have received from Mr. Joseph Wasson, the author, a little pamphlet on "Bodie and Esmeralda," being an account of the revival of affairs in these two singularly interesting and important mining districts, including some of their past history, with a detailed description of mines most developed, tunnels, mills, etc. A resume is also given of the general resources of Mono and Esmeralda counties. A number of maps and illustrations are also given. Included in the contents is the gist of the reports of Profs. Benjamin Silliman and W. P. Blake, the late J. Ross Browne, B. H. Shaleh and H. R. Whitehill. The book may be had through this office. A retrospective and prospective glance is given, together with a detailed account of the mines and operations of the present time. Mr. Wasson has lately visited these districts, and his observations are fresh and interesting.

The accompanying map, which we take from the pamphlet referred to, will assist the reader in determining the relative positions of the districts. Bodie is in Mono county, Cal.; Esmeralda is in the county of that name in Nevada; the boundary line separating the two States passing about midway between the two districts. Distance from Carson (where travel is transferred from car to stage coach) to Bodie, via Aurora, 110 miles; fare \$15. From San Francisco to Bodie, \$36; time, 36 hours. From the junction five miles north of Aurora stages leave for Marietta (45 miles), Bellville, Columbus, Silver Peak and other places of interest in Esmeralda county, within a radius distant from Aurora of from 75 to 125 miles. Roads generally good, with corresponding accommodations.

As Mr. Wasson says, almost a generation has passed since these districts were a leading theme on 'change, and but a limited number of the California people of to-day retain anything more than a vague recollection of the "Esmeralda" excitement—some, of course, to their sorrow; but few can he found who will not readily admit that they themselves were more to blame than the mines in question. No two districts are at the same time so important and less rightly understood. The object of his publication is to present just sufficient of the leading outlines and details of the past and present history and affairs of two of the most interesting districts in the annals of mining, as to enable the reader, in one or two hour's time, to obtain a substantial and intelligent impression thereof.

The following remarks, made by Mr. Wasson in the introductory chapter, though general in character, will be recognized as true by mining men: The progress made in mining for the precious metals during the past 18 or 20 years (speaking of quartz or vein mining, of course) is so striking, that it recalls the remark of a favorite author, concerning the old Goths and Vandals—that they discussed every subject twice: once drunk, that their debate might not lack vigor, and once sober, that they might not want discretion. Speculating in mining stocks is quite a different matter from real mining, and, no doubt, the wildest excitements will be repeated over and over again; but it cannot be in the nature of things that the reckless disregard of all systematic exploration, so characteristic of vein mining in its earlier stages, will ever be repeated on this coast; such a wild use of means and general bad management, pure and simple. The raids of the barbarians, during the dark ages were no more bloodthirsty or heightened in character than the continual "rush" in quest of "new diggings," and the accompanying operations as to development. It was little better than a drunken orgie of rapacity, ignorance and extravagance. There being no longer new worlds to conquer, there is a comparative settling down to the best methods of realizing something from the discoveries already made. A successful soldier, having removed all barriers to prospecting, there is no longer any faith placed in the stories of the early emigrants on northern routes, or of the Jesuits of the southern borders; mining everywhere has become a question of money, muscle and intelligence. The occasional reports of rough life in the Black Hills, sound like the echoes of an almost forgotten past. Doubtless new discoveries will yet be made, but the day of wild adventure is over. The advantage of railroad extensions cannot be overestimated in connection with pushing the discovery of new districts, and their subsequent development. It enables prospectors, wherever there are no mills, to ship ores long distances for purposes of testing and for sale; the advantages of travel, transportation of supplies, etc., are of course self-evident. The invention of nitro-glycerine and its various ramifications have also taken place, and served to revolutionize mining. The substantial monopoly of mining interests on the Comstock, however, is compelling men of means and who are disposed to invest in such enterprises, to look elsewhere. Probably no more striking instance of this fact can be found outside of the two districts treated of in the following publication. Even that able and jealous guardian of Washoe interests—the *Enterprise*, of Virginia, Nev.—in an editorial of date February 10th, 1878, speaking of "Outside Camps," in a constrained manner, says: "There seems to be an impression that there is a drawing away from Comstock shares, and a disposition to search for outside mines. * * * Turning south, Aurora has awakened from the lethargy of years, and 10,000 eyes are turned toward that district and its neighboring district of Bodie."

The recent rain at San Bernardino was the heaviest of the season, one and three-eighths inches having fallen.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, & F

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission and Fremont Streets

Dewey & Co. { Sansome St. } Patent Ag'ts.

R. HOE & CO'S CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Files are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in Mining and Scientific Press.

H. L. TATUM & Co., Sole Agents,

No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CUPS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or slop, and at a merely nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAME MAKE.

Lumber, Shingles, Sash, Doors, Lime, Brick, and Builders' Hardware

Sold at the Lowest San Francisco rates. Strict attention given Country Orders. Boats loaded at wharf for all points on the San Joaquin and Sacramento rivers. Cars of the C. P. R. R. Co. loaded at the yard. Orders received at 22 California Street, San Francisco, or at the hardware store of G. W. Babcock, 955 Broadway, Oakland.

JOHN F. BYXBEE, Proprietor.

THOMAS RICHARDSON, Manager.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1865, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

THE O'HARRA
CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day.....\$ 3 00
Wood, 17 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
Cost of one ton.....67 1/2
From 2 1/2 to 5 per cent. of salt is necessary.
In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

BAUGH & SONS, Philadelphia.

\$1,000 Challenge Ore Feeder.

HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. O. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripo mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO., GREENVILLE, PLUMAS CO., OCT. 16TH, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN, Superintendent Gold Stripo Mine.

One of the principal owners of the Gold Stripo and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machine ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

Woodward's Gardens were never more attractive than at present. A fine lion and two lionesses, all young and not fully grown, have just been added. Balloon ascensions by Prof. Martin are now being made. The popularity of the gardens continues to increase. Rates of admission unchanged.

OUR AGENTS.

Our FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THAYER—San Francisco.
B. W. CROWLEY—California.
A. C. KNOTT—Pacific Coast.
C. N. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMPION—Tulare, Fresno and Inyo counties.
EDWARD S. BAKER—Australian Colonies and Sandwich Islands.
W. D. WHITE—San Bernardino and Los Angeles counties.
J. W. A. WRIGHT—Sacramento county.
B. E. LLOYD—Sonoma and Napa counties.
E. M. DENRY, Oregon.
H. E. HALLER—Marin county.
G. W. MCGREW—Santa Clara county.
W. M. BREWER—Black Hills, Dakota Territory.
RICHARD ALLEN—British Columbia.
R. D. NUNNALLY—Siskiyou County, Cal.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and subscribers against the acts and mistakes of others.

MR. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

ANY PHOTOGRAPHER having a large Camera Box for sale will please notify "N. S." at this office.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

The Mining & Scientific Press,

Is the leading mining journal in America, and it enjoys a large circulation among the most intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, postage prepaid, \$4 a year in advance. Sample copies, post paid, ten cents.

DEWEY & CO. Publishers, S. F.

REGISTER YOUR TRADE MARKS.

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights in the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

A. T. DEWET. W. B. EWER. GEO. H. STRONG.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco Evening Post.)

This volume is now ready. It is a large 12mo of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachap Pass, on the S. P. R. R.; Yuma, Prescott, Phoenix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabazas, in the valley of Santa Cruz; Corraunac Peak, the Ariave Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Outman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indian, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father Kino's map, in which the Mc Crackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndal.

The latter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also, of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for \$2 each.

HINTON'S NEW MAP OF ARIZONA.

Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, \$2.50 each; in covers, \$1.50 each.

Liberal deductions made for the trade. Address

Certificate of Partnership.

The undersigned having, January 1st, 1878, formed a partnership to carry on the business of general machinists and engineers in constructing and repairing machinery under the firm name and style of Birch, Argall & Co., this certifies that the principal place of business of said partnership is situated at 119 Beale street, in the city of San Francisco, State of California, and that William H. Birch and John Argall, each residing in said city, are all the members of such partnership.

WM. H. BIRCH. (Seal.)

JOHN ARGALL. (Seal.)

STATE OF CALIFORNIA,

CITY AND COUNTY OF SAN FRANCISCO, ss.

On the twenty-fourth day of May, A. D., one thousand eight hundred and seventy-eight, before me, J. Robert Read, a notary public in and for said city and county, residing therein, duly commissioned and sworn, personally appeared William H. Birch and John Argall, known to me to be the persons described in, whose names are subscribed to, and who executed the annexed instrument, and they acknowledged to me that they executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal, at my office, in the city and county of San Francisco, the day and year last above written.

J. ROBERT READ, Notary Public.

(Seal.)

Endorsed—Filed May 29th, 1878.

TIMOTHY H. REYNOLDS, County Clerk.

By J. WHALEN, Deputy Clerk.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent, through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips prepared for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

California Fruit Growing Association.

Principal place of business, San Francisco. Location of property, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of May, 1878, an assessment (No. 3), of three (\$3) dollars per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 641 Sacramento Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of June, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the twentieth day of June, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y

Office, 641 Sacramento Street, San Francisco, Cal.

Cherokee Flat Blue Gravel Company.

Location of principal place of business, San Francisco, California. Location of works, Cherokee Flat, Butte County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 39), levied on the seventeenth day of April, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
J. Bandman	11	320	\$ 16 00
A. Caselli	17	4608	230 40
Flint, Peabody & Co.	19	480	24 00
Flint, Peabody & Co.	20	100	8 00
Pfaffner, E. J.	10	480	24 00
Schmidt, Louis	8	128	6 40
Winans, Jos. W.	32	1844	97 20

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of April, A. D., 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of said Company, on Tuesday, the eighteenth day of June, A. D., 1878, at the hour of two o'clock p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Sec'y.

Office, Room 6, No. 313 Pine Street, San Francisco, Cal.

Excelsior Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Potosi District, Lincoln County Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10), levied on the twentieth day of April, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
J. Antonovich	234	100	\$25 00
A. W. Lind	254	50	12 50
M. Michelson	209	44	11 00
J. Michelson	263	100	25 00
H. M. Pearce	248	100	25 00
L. T. King	262	50	12 50
Adolph Wirtner	252	25	6 25
Adolph Wirtner	253	25	6 25
Salvator Russo	239	25	6 25
Peter Wiese	115	50	12 50
Peter Wiese	219	10	5 00
Peter Wiese	220	10	2 50
Peter Wiese	257	30	7 50

And in accordance with law and an order of the Board of Directors, made on the twentieth day of April, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, 304 Post Street, on the tenth day of June, 1878, at the hour of one o'clock p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

FRANCIS P. DEVINE, Sec'y.

Office, 304 Post Street, San Francisco, Cal.

Gover Mining & Milling Company.

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-fourth day of May, 1878, an assessment (No. 35), of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Wednesday, July 1st, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the first day of August, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal.

Summit Mining Company.—Location of

principal place of business, San Francisco, California.

Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of May, A. D., 1878, an assessment (No. 3), of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, Room 6, No. 313 Pine Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighteenth day of June, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the Monday, fifteenth day of July, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the PACIFIC RURAL PRESS for January 25th, and also the MINING AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the PRESS as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

To Ship and Engine Builders, Steamship Companies, Etc.

A Mechanical Engineer, having an extensive experience in Marine Engineering (especially compound) and Iron Ship Building, also in Steam Engines and Machinery in general, is open for engagement. First-class references.

Address and references can be obtained at office of SCIENTIFIC PRESS.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degree to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80 to 98 of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Cananache, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. DEWEY & CO.**American & Foreign Patent Agents**

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Pacific Coast Insects.

We learn with regret that the vicissitudes of life lead one of our most distinguished citizens, Mr. Henry Edwards, to break up his residence upon this coast and find a home elsewhere. We shall lose a man of genial and genuine character and of distinguishing eminence in his branch of scientific research. We shall lose a source of light which, at this time, we most need, because no one knows so well as he the insects which are making inroads upon our agriculture, and no one could have been freer in communicating the results of his studies for the public good.

During the score or more of years that Mr. Edwards has been studying Pacific coast entomology, he has been building up a collection of insects until he has now, we believe, 60,000 species, properly arranged and named. These include all typical forms. This collection is the one which the late Agassiz so much admired, when he visited this coast, and wished to secure for Harvard University. Although we might speak at length of the scientific value of such a collection of Pacific coast insect life, this does not comprise its greatest value from our point of view. We look upon the collection more from the side of practical value. We do not mention the so-called "museum" features of the collection at all. It is rather as a means of educating us and our children in a knowledge of insects which they must master or the insects may master them. A collection like that of Mr. Edwards is to the student of entomology what a library is to all of us. It is so much knowledge stored up, classified and always accessible. We must have entomologists and if Mr. Edwards retires from the field, others must come up to do and extend his work as each new year may require. If these followers of his have his collection for reference, and by it to study each new pest which makes itself known by its evil work, they can learn in a few moments necessary points which otherwise they might have to search for far and wide before they found them. We can ill afford to lose this advantage in our future struggle with injurious insects. Although Mr. Edwards has made his entomology a labor of love during all these years, and counts his times nothing, he cannot afford to lose the money actually expended in its material result, the collection. It has a value elsewhere and he must realize elsewhere if not here. He will part with it for simply the amount of money invested in its material making up, if it be bought for the public benefit, and that is \$12,000. It has been proposed to raise the money among citizens who can well afford to give of their wealth for securing the collection for the University or some other public institution. Four citizens have subscribed one-half the amount, \$6,000, providing the balance can be raised by voluntary contribution. Here is a chance for our men of wealth to put a little of their money where it will be a lasting benefit. We trust they will not be backward in contributing toward securing the collection and placing it for the public good. It ought not to be allowed to leave the State.

MECHANICS' INSTITUTE ELECTION.—The annual election of the Mechanics' Institute took place on Monday, for the election of seven of the fourteen persons constituting the Board of Trustees. The election was one of the most exciting the Institute ever had, party feeling running high and a strong force of voters turning out. The election resulted in favor of the Opposition ticket, by the following vote: Regulars—L. B. Benchley, 266; Jonathan Kittredge, 269; James Drury, 267; David Kerr, 266; George H. Hopps, 271; J. A. Bauer, 266; J. K. C. Hobbs, 265. Opposition—D. A. MacDonald, 301; Robert Sherwood, 298; Samuel H. Wheeler, 308; Samuel Dinmore, 309; Edward McGrath, 293; Adolph Schmolz, 295; H. L. Davis, 304.

ALL the Powers have accepted invitations to the Peace Congress, wherefore matters look much more pacific in Europe.

THE JUSTICE OVERWINDER.—An apparatus to prevent the overwinding of hoisting cages is in operation at the Justice mine and is found to work to a charm. It has been in use two or three days and never fails. Day before yesterday while two cars loaded with rock were being hoisted, Superintendent Curtis directed the engineer to turn on all steam, stand back from his engine and let things take their course. The cage was coming up at lightning speed—everything just bouncing—and the engineer's hands were twitching nervously, when, at the depth of 100 feet below the top of the shaft, the cage moved a lever and half the steam was shut off at the engine. A moment after the cage was ascending at a moderate speed and presently appeared at the mouth of the shaft, passed the proper stopping place and moved on upward toward the sheaves. Just before it

THE LATE INDIAN SCARE IN IDAHO.—The facts in regard to this business, says the *Idahoan*, were as near as we can learn, about as follows: Some 150 Bannocks, men, women and children, with their tents and baggage, with permits from the agent at Fort Hall, while on their way to eastern Oregon, killed a few cattle and otherwise trespassed upon the property of citizens, behaving defiantly when demonstrated with, without committing violence upon persons. They do not appear to have been generally armed, and the fact that they travel with their families and property, forbids the idea that they intended a hostile demonstration. The cattle owners were, however, exasperated and the inhabitants alarmed, and a slight indiscretion might have produced deplorable consequences. But the Indians having passed into Oregon, the Governor and Major Collins

FIG. 1.

ROOT'S ROTARY HYDRAULIC ENGINE.

reached the point of danger, however, the cage pressed another lever, a powerful brake was applied to the hoisting reel and the cage, with its load, was instantly stopped. All this was done without the engineer moving a hand, and had he been sound asleep the cage would have

stopped just the same. From what has been said above mining men will be able to obtain a good idea of the apparatus and the manner in which it works.—*Virginia Enterprise*.

The Lick Trustees have secured a State patent to the land in the vicinity of the Observatory site on the summit of Mount Hamilton.

agents permitting large bodies of Indians to roam over the country committing robberies and terrifying the inhabitants, should be forbidden by the authorities at Washington. Under this most reprehensible practice, another Indian war may, through sheer accident or imprudence, be precipitated upon us at any moment.

Root's Rotary Hydraulic Engine.

The attempt to produce rotary motion by means of revolving instead of reciprocating members has often been made by inventors for centuries past, the greater speed and steadiness of motion, the simplicity and fewness of parts and the directness of application being desiderata well worthy intelligent and persistent effort. To this search for something needed, we owe the almost countless rotary engines, blowers and pumps, actual and projected, which have, with but few exceptions, accomplished no practical end. All of these are divisible into three or four general classes at most, one of the most successful, whether as a driving or a driven member, being that employing two pistons precisely similar and meshing into each other as true gear-wheels. One of the most practical of these employed as a blower, the *Polytechnic Review* formerly described, more on account of its importance than of its novelty, it being (see Fig. 2) essentially two gear-wheels of circular pitch-line, each having two teeth and playing in a case with semi-circular ends, or sides. The same makers, P. H. & F. M. Root, Connorsville, Ind., now present to the public a machine on the same principle and designed as a driver, even employing it whenever simplicity is a great object in producing reciprocating motion.

Fig. 1 shows it in perspective and Fig. 3 the principle of its transverse vertical section. As will be seen, there are two pistons or followers, each having two gear-teeth rolled from any suitable curve and at all times closing direct passages through the casing. Thus the passage of any fluid under pressure can only be accomplished by revolution of the pistons in opposite directions. As the leverage and abutments are such that pressure of any fluid tends to cause such revolutions, the application of the device as a hydraulic engine or motor is at once apparent. In the sectional cut the four packing strips are disposed with the intention of producing tightness without that undue or unnecessary friction which would result were the piston peripheries to contact with the whole inside surface of the casing. The set-screws shown permit of adjusting these packing strips as desirable, taking up wear evenly. Spur-wheels without the casing, on the piston-shafts, ensure proper presentation of meshing tooth-faces and that regularity of the piston's action not attainable with two-toothed gears, and which for sewing-machine and organ use is an essential.

The entire absence of valves and complication and the extreme simplicity of the mechanism commend it for many uses (especially domestic) where small noiseless motors, free from nuisance of smoke, steam, gas or acid fumes, are desirable. The shafts are of steel and the interior operating parts of brass. There is an automatic device for starting and stopping.

COMMENCEMENT AT THE UNIVERSITY.—The commencement exercises at Berkeley on Wednesday were largely attended and very interesting. The essays and orations of the graduates were creditable. Formal transfer of the Law College, founded by the beneficent gift of Judge Hastings of this city, was made. The Judge delivered an eloquent address, and response on the part of the trustees was made by Mr. Bishop. At the alumni meeting an able address was made by Samuel Williams, and a poem was read by Mr. Barker. The new building for the college of the Mechanic Arts is progressing finely, and will soon be enclosed.

THE DRAINAGE CANAL.—The engineering party have commenced the survey for the Sacramento River Drainage Canal District. The first camp will be at Denver, Solano county, which will be the headquarters for the time while the soundings of Suisun bay are being made. Col. Isaac Smith is Chief Engineer in charge of the work.

FIG. 3.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

From Arizona.

An Important Land Office Ruling.

EDITORS PRESS:—In March last, a letter was sent from this place to the Commissioner of the Land Office in Washington, suggesting the desirability of an official "ruling" in regard to the actual time when a mining claim is forfeited if the work required under the act of Congress of May 10th, 1872, is not performed.

The special case to which the letter referred was of this nature: A locator had taken up a claim here on February 27th, 1877, and until noon of February 26th, 1878, had not worked upon it. At that hour two men came on the ground and represented that they had arranged with the locator to do his assessment work for the preceding year. A few minutes before the advent of these men, a prospector had relocated the lode in the belief that it was vacant, but the new comers warned him off, and, commencing work, alleged that their resuming possession before the year expired, made the title of the original locator as good as if his work had been fully completed. Here is the Commissioner's answer, the italics representing words which were under-scored in the original:

WASHINGTON, D. C., April 15th, 1878.

Referring to your letter of the 21st ult., I have to state that a mining claim must be located in accordance with the local laws and Congressional enactments, and the amount of expenditure required by local laws must be actually made upon the claim to entitle the party claiming the same to hold it. The Congressional enactment requires that not less than the amount therein specified must be placed upon the claim annually. It is only where parties comply with the local laws and the Congressional enactments that they can legally claim mining land.

Very respectfully your obedient servant,
J. A. WILLIAMSON, Commissioner.

The above is a very important decision and proves conclusively that a person who has failed to do his assessment work, does not in reality "resume possession" of a lode by simply walking a mile or two and setting his foot on the outcrop a few hours before the year expires. He has lost possession by allowing himself insufficient time to complete his work in accordance with the law. If, while there is a default as to labor and the land is necessarily vacant, a locator enters into possession, he will hold it, unless the former claimant renews his title by the requisite expenditure before the year is finished. This decision will make it an unsafe thing in the future for a locator to sit down and do nothing in the expectation that at the end of the assessment year he can get a brother or friend to relocate a claim for him which he has previously held and so control it for another year by merely paying the recording fees. Some one may slip up before him and derange his well-laid plans. If the law could be successfully evaded from year to year in the manner indicated, it would be an easy matter for an active, sharp fellow to hold the mines of an entire district at a nominal cost in money.

The Decay of Ore in Mineral Veins.

I learn from a friend that San Francisco capitalists have little confidence in the mines of this district, because the surface ore bodies, they affirm, decrease in quantity and value in going down 40 or 50 feet. It is quite true that deposits of ore found in quartzite here get smaller and poorer under slight development. What they will prove to be in the deep is only a matter of opinion as yet. In our syenite country rock the lodes are better defined than in the quartzite, but the ore is not nearly so rich usually as in the latter. They too get poorer after running down 20 to 40 feet, but improve again towards the water line. The improvement in the Hannibal, Stonewall Jackson, General Lee, Buckeye, Mexican and other mines that are opened from 85 to 150 feet in depth, is all that could be wished, and we may hope that in the quartzite the same result will follow development. There is nothing peculiar or discouraging in our surface ores not continuing as rich as they are in the croppings. Near the grass roots, the ore that is saturated with water during the winter becomes dry in early summer, and decay or loss of the precious metals is checked. At a greater depth this drying out and preserving process is less effective and disintegration and decomposition goes on the whole year. A firmly-encased fissure will collect more moisture and lose its metal more completely than a deposit protected by the country rock. It may be well to remind those who underrate our mines because they behave in the way referred to, that the same thing has happened in every mining district on the Pacific coast, yielding chloride or free-milling ore. The pioneers of Reese River district will remember how down-hearted mine owners were in 1864, by the "petering out" of their rich surface ores. At a depth of 20 to 40 feet, \$10 assays were common, where the top ore assayed from \$200 to \$2,000 per ton. Until the water-level was reached and preserved sulphuret ore came in, there was nothing permanent about the Lander hill mines, though they are now pointed

to as types of mining permanency. The history of almost every district is the same, and hence the reason why a period of depression and something like abandonment is sure to follow a prospectors' excitement over very rich croppings. The galena and carbonate ores seem to hold out better, but even in the now justly celebrated mines of Ruby hill, in Eureka, Nev., there have been times when false but ready-tongued prophets foretold the absolute exhaustion of some of the best claims. I remember having an argument in 1872, with a person who had been through the works of the Champion mine, of the Eureka Consolidated company, in regard to the prospective value of that property. He asserted that the large surface ore body had first dwindled down to a narrow streak, and then, when followed in various directions for a long distance, had completely given out, never to come in again. I told him that I believed the Champion would be a greater mine 10 years from that time than it ever had been previously, and I still think so.

As to the mines of Globe district, time will prove that they are very valuable, but they must come into prominence by actual money-yielding merit and not by speculative "operating" in San Francisco. It will take years to bring them into a really profitable condition, for the experts who have strutted over our hills for three or four days and told us a good deal more than they themselves ever knew, have made it a hard matter for mine owners to secure financial aid, but time will remedy this evil in defiance of all opposition. J. D. E.

Globe District, May 23d, 1878.

Mining Around Auburn, Placer County.

EDITORS PRESS:—The Jenny Lind at New-castle, perhaps better known as the Schnabel mine, from the name of the proprietor, has been opened to the depth of about 450 feet and has gradually improved from the surface downward. When visited by the writer in 1866, it paid from \$5 to \$6 per ton. It now yields from \$9 to \$10 per ton, and is evidently paying handsomely. Its past history and progress resemble in some respects the Hayward mine of Amador. Its present condition is certainly unusually healthy, while it gives promise of a brilliant career in the future.

The St. Patrick, at Ophir, is represented to contain the richest rock of any mine in the vicinity, and great hopes are entertained for it under its present management. Economy seems to be the order of the day and if it fails to pay, the fault will not be at the door of prudence and energy.

Mr. A. O. Bell, on Bald hill, has pumped the water from his shaft and is preparing to go down in search of another rich pocket. This hill has doubtless a fortune in it for many a man if he only knew where to find it. It is a nice field for some rich company to win or lose a very large amount of money.

The Rock Creek mine, owned by Messrs. Molin & Heenan, three miles north of Auburn, gives a very promising prospect for the depth attained. An incline shaft is now 80 feet deep, the ledge widening from the surface down. At this point it is from three to four feet thick. The quartz contains some sulphurets of lead, iron and copper, and has thus far averaged \$30 per ton. They are preparing to erect hoisting works here to be run by water power. Among the recent enterprises inaugurated here may be mentioned that of

The American River Dredging and Mining Company.

Under the immediate management of Mr. C. P. Chapman, a gentleman of considerable experience in mining matters, besides having much personal interest in the success of the enterprise. The company is made up chiefly of Boston capitalists. The claim is situated a few miles above Auburn on the Middle Fork of the American river—widely known as one of the richest of the many rich streams that gave up their golden sands to the early miners of California.

The particular location is Brown's cut, lying between Kennebeck and Murderers' bars, from which it is stated millions have been extracted in the past. The dredging machine used is similar to the one illustrated and fully described some time since in your columns. But for the benefit of such as may not be familiar with its construction and mode of working, it may be stated in brief, that the dredging part consists of a cylindrical tube which is forced by steam power down into the sand or gravel, and there, the air being extracted, it fills immediately with the contents of the river bed, when it is hoisted to the surface, swung round over a sluice and emptied.

The machine here built will have power to raise 1,000 tons per day of 10 hours (a depth of 45 feet), and will be in readiness for operations about June 10th. In its construction the company have greatly improved on those put up at Oroville, having, evidently, profited by the experience gained therefrom. They have made the scow, for carrying the machinery, shorter, narrower and higher and strengthened it much by trussing and otherwise, so as to sustain hundreds of tons if necessary. They have also lessened the weight of the suction tube at least one-half, and use double the power—a 50 horsepower hoiler by Hodge & Co., Boston, being now on the ground for the purpose. With

these improvements and the rich ground to work, results may be looked for that will astonish the old miners of '49, who, at the most, could handle but about two tons per day.

A. C. K.

The Yellowstone Park.

Protect the Yellowstone Park by all means possible and practicable. It is a creation that no vandal should be suffered to gaze upon. Secretary Schurz's request for \$15,000 to improve and protect it should be granted without a dissenting voice. The report of the Superintendent of the park shows the absolute necessity for a live guardian—one who can shoot. The Superintendent says that the act of March 18th, 1878, set aside and dedicated the Yellowstone National Park for the benefit and enjoyment of the people, and provided formally against trespassers, and for the preservation from injury and spoliation of all timber, mineral deposits, and natural curiosities and wonders within it, and their retention in their natural condition; also against the destruction of fish and game and for the construction of roads and bridges therein. No appropriation has as yet been made to execute this legislation within my personal knowledge, which is confirmed by official publications and those of travelers. Valuable forests of pine and cedar timber have been prostrated and travel impeded by the careless use of fire. Bison, elk, antelope, bighorn sheep, and other beautiful and valuable animals have been slaughtered by the thousands merely for their tongues and pelts. Great masses of ancient timber, fossils, geysers, cones, and beautifully scalloped pool borders which made the region valuable have been broken up to obtain transportable specimens, which have been made articles of fraudulent commerce. The preservation of these animals and wonders, and the construction of roads, bridges, etc., are necessary to carry out the act. The opening of the great Yellowstone route by steamboats, and the approach of several railroad routes, in rapid construction toward it, show the immediate need of practical means, both to preserve the park from irreparable damage, and to make the beauties enjoyable.—E. C.

COMPRESSED AIR FOR MOTIVE POWER IN CITIES AND IN MINES.—The advantages of compressed air over steam in mines are, that it assists rather than injures the ventilation, keeps the air cool, and avoids the injurious effect which steam exerts on timber and on certain kinds of rocks. In the cities, compressed air will not frighten horses as much as the puffing of a steam-engine, but it is not pretended that it will be less expensive. It would avoid the labor of firing and the annoyance of ashes and coal-gas that are the most disagreeable features of the steam cars on our elevated roads. We confidently expect to see mechanical means take the place of horses for motive power in cities, and it seems probable compressed air may be the most convenient agent, with reservoirs for compressed air located at intervals throughout the city, and engines attached for compressing the air. These might be placed in vaults under the sidewalks, and carriages and wagons could be arranged with reservoirs, which could be charged as often as desired at these street reservoirs, an operation which would occupy but a few minutes; and it would require but a very small reservoir to contain, under the very high pressure assumed, sufficient power to run a carriage three or four miles. The saving in pavements and horse-flesh and in the keep of horses would, in a single year, probably pay the entire outlay required.—Engineering and Mining Journal.

BENTON.—Concerning this town, located in the southerly part of Mono county, the Carson Appeal remarks as follows: There are about 600 persons in and around Benton, the greater portion of them being engaged in assorting ore and in other departments of mining. Idlers or non-producers are scarce in Benton. Work in the Comanche mine, the oldest location in this quarter, is for the present abandoned. The Carrick mine, owned by the Comanche mill and mining company, is turning out a daily average of ten tons of very rich quartz, which is being crushed at the Comanche mill. The Carrick mine employs about 20 men. The Diana company, working about 30 miners, is taking out rich ore, which is being reduced by the company's five-stamp mill. Several smaller mining companies are also getting out ore, and generally doing well. Benton, for the benefit of those not geographically posted, lies about 50 miles in a southerly direction from Aurora.

DON'T GO THERE.—The United States Consul at Buenos Ayres, the capital of the Argentine Republic in South America, warns people in the United States not to come to that country with much expectation of bettering their condition, and not to come at all unless they have money enough to get home with in ease they do not find some employment or business. The Consulate is flooded with Americans who have been disappointed in not finding work, and who have no means of getting back to the United States.

It is said by those who claim to be posted, that a bonanza of large proportions has been uncovered in the Independence mine at Tuscarora, and that the company will declare a dividend next month.

Black Mountain District.

Concerning this locality, situate in Esmeralda county, Nevada, a correspondent of the *Stock Report* writes as follows: Work on the various mines here is progressing steadily and prospectors swarm on every hillside, all meeting with good success. The principal mines being worked at present are the Endowment and Combination, incorporated and having their offices in your city. The Endowment Co. has been operating a little over a year, and with such success as to require an enlargement of their five-stamp mill—heretofore the ore has been of such a character that it could be profitably worked by raw process; as depth is gained it is found necessary to roast it, wherefore the Endowment Co. is putting up a 10-stamp mill with Howell's improved roaster, which is being pushed to completion under the management of the most experienced mill men. Their mine is in splendid condition, having several fine bodies of high grade sulphuret ore assaying up in the hundreds. They expect to have their mill completed and running in a short time, when this mine will come to the front as one of the solid bullion producing mines of the coast.

Adjoining the Endowment and on the same lode is the property of the Combination Co. It is but recently that active operations have been going on in this mine, which is efficiently and economically managed. With but a small force, a working tunnel, upwards of 600 feet long, has been driven in the mountain, and crosscuts have developed a fine ledge at a depth of about 400 feet, proving in its character and extent fully as good and extensive as the adjoining mine. Ore bodies have been opened up here that would amply repay the expenditures necessary for a mill, but the management pursue the wise policy of first proving their mine, so they can understandingly build what is necessary. Exploration still continues with success in the main tunnel, but aside from that several smaller workings have been opened showing up splendid ore; in one prospect tunnel they have got a streak of ore assaying from \$200 to \$600 per ton, and increasing as depth is gained on it. Should developments of the next few months equal those of the past the Combination will equal if not rival its fortunate neighbor, the Endowment. It will take time and many a hard knock and not a little money to thoroughly develop all our promising claims, and should your capitalists devote but a trifle to this section that is thrown away on so-called bonanza countries their dividends would not all be left-handed.

Solid Silver.

The Salt River (Arizona) *Herald* of the 18th says: Two prospectors arrived, a few days since, at the Agua Fria smelter, 20 miles east of Prescott, with 280 pounds of ore, which was interspersed with native silver, in the shape of wire, spikes, feathers, daggers and all conceivable forms twined in together, constituting the handsomest lot of silver specimens ever found in any country. The smelter put the mass through and the result was found to be 110 pounds. The ore is from a new camp, between 20 and 40 miles southeast of old camp Reno, Maricopa county, in the Sierra Ancha mountains. There are some 15 men in the camp, which is situated at the head of Cherry creek. Messrs. Golen and May, the two prospectors above mentioned, found a large dyke, capped over with iron, and, about 20 feet from it and running parallel with it, a stringer which showed chlorides and considerable horn silver. They began to open it and found the rock very much decomposed on top and quite rich. They took out about a ton and a half, which they considered worth \$3,000 or \$4,000 to the ton, before the rock began to harden, but at a depth of a few feet the ledge or seam became solid, the carbonates and chlorides gave out and bright native silver made its appearance. At one point it was four inches thick, wedged-shaped, with the big end up. They took out the most of what they could find of this character, as before mentioned. They will return and sink about 100 feet on the stringer, when, if it does not at that depth join the main ledge, they will cut across it and explore it below the iron cap, with the expectation of finding a rich streak somewhere in it. The ledge matter in the stringer contains native silver in small quantities throughout, but not enough to make it an object to work for that alone. It is quite likely that in sinking this streak will open out again.

ANOTHER PROCESS.—William Shewan, an old amalgamator, claims to have discovered a process by which ores can be worked without the use of tanks of any kind or slum reservoirs and will yield a greater percentage of returns than the old methods, while the mills may be worked to their usual capacity. Such a process would reduce the cost of milling by at least one-third, and Mr. Shewan should lose no time in making it known to some competent mining or mill man.—Virginia Chronicle.

SULPHATE OF MAGNESEA.—An epsom salts mine has been discovered about 12 miles from Chattanooga, Tenn. The deposit is two feet thick and is easy of access. It is pure and only requires crushing to make it marketable.

HEAVY shipments of quicksilver are made almost daily from Calistoga, California, and there are good indications of a revival soon of work in nearly all the mines in Sonoma county.

MECHANICAL PROGRESS.

ELECTRIC LIGHT.—A large number of prominent gentlemen, says the *Railway World*, assembled at the Pennsylvania depot, West Philadelphia, last week, to witness the experiment of illuminating that huge structure by means of the electric light. The experiment proved a brilliant success. A newspaper could be read with comparative ease at a distance of 100 feet from the light, and the shades of color in clothing were also distinctly visible at the same place. The gas lamps burned dim and yellowish in the intense whitish glare, which rendered the depot almost as light as day. In the machine used the light is produced by electricity generated from the apparatus, which consists of four magnets with an armature rapidly revolving between them. The power is from a steam engine, which drives a shaft on which the armature revolves. The shaft makes 1,100 revolutions per minute, and the current is taken from the commutator by a simple arrangement, and from thence carried to the wires. These wires are run through the building and connected with lamps of a special invention. The light is produced by the combustion of carbon by a contrivance by which the current of the machine is made to regulate the lamp. The upper carbon burns at the rate of a little over an inch an hour, costing for each lamp two cents per inch. This is the sole cost of the machine except the running of the machinery.

TEMPERING FILES.—After the files are cut the necessary hardness must be given them. For this purpose, says the *Iron Age*, the following composition is used: 2 parts (by weight) of salt, 15 parts of rye grist and 30 parts of burnt cow hoofs, all ground together and mixed with a sufficient quantity of water to make a pasty mass, with which the files are covered. When dry they are placed in a fire. If during the heating the coating should drop off at certain places the files are promptly withdrawn and the place exposed is covered with dry hoof powder. It is returned to the fire, where it is left until a temperature is reached which best suits the steel of which it is made. Then the file is plunged vertically into the bath specially prepared for the purpose, care being taken not to move them to the right or left, as that would cause warping and make them unsalable. The bath is made in the following manner: 28 parts of salt are dissolved in about 5 parts of water, to which a handful of iron scale is added. After tempering the files are washed, brushed and dipped into lime-water to prevent rusting. As soon as they are entirely dry the tangs are softened by being plunged into red-hot lead. Whenever it is only necessary to give the files a black color, it will suffice to dip them hot into ordinary oil. Before packing them it is well to paint them with turpentine mixed with white lead and lampblack.

A HILL-CLIMBING LOCOMOTIVE.—We read that an interesting series of experiments are about to be carried out at the Royal Arsenal, Woolwich, to test the efficiency of a special kind of locomotive engine which has been constructed for the new trench railway. This railway is designed to be laid upon the surface of the ground wherever it may be found necessary to construct earthworks or to transport material, the ordinary methods of reducing irregularities by cuttings and embankments being out of the question in field operations. The engine is, therefore, designed to ascend and descend sharp gradients, and is also fitted with an apparatus for hauling up and lowering loaded trucks. A hill too steep to be ascended with a load behind may be surmounted by the engine alone, and it may then wind up the load after it. An experimental railway running up and down hill in irregular fashion is being formed near the butts in the Government marshes adjoining the Royal Arsenal, for the purpose of the trial.

THE LARGEST ELECTROTYPE EVER PRODUCED.—The Electro-Metallurgical Company of Brussels, has lately completed a colossal statue of Jan van Eyck, in bronze, by the system of electric deposition. The galvanic process occupied several months, although a thickness of but six to eight millimeters was attained. It is probably the largest object which has been produced by this method, being over 12 feet in height, and is regarded as a much more perfect imitation of the model than could be obtained by casting.

GALLIUM WORKING.—Gallium is a hard and malleable metal; it takes under the hammer the polish of the anvil, but rapidly grows harder and brittle, and is then liable to fly to pieces. In spite of its relatively considerable hardness, gallium leaves on paper strongly-defined marks of a bluish-gray color. It retains its luster in the atmosphere of a laboratory constantly loaded with acid vapors, and undergoes no alteration in appearance in boiled water. In aerated water it tarnishes slightly.

A STRONG BOX.—The silver vault now in course of construction in the Sub-Treasury will be 47 feet in length by 24 in breadth and 12 feet high, and will hold \$40,000,000 in silver when finished. The cost of the iron and steel work employed in its construction was about \$20,000, including the doors and their levers. The floor of this vault will be iron and steel two inches thick, and under this will be four feet of concrete.

Locomotive Boiler Building.

As we have noted before, the Master Mechanics' Association of the Eastern States has been at work, during the last year, collecting facts and opinions concerning the best material and design in building locomotive boilers. Although we are not building locomotives on this coast, our mechanics will be glad to know what is considered the best practice at the East. In its report of the last meeting of the Master Mechanics' Association, the *Railroad Gazette* notes the points made by the committee charged with this investigation:

In answer to the question, "Which have you found to be the best material for the shell of the boiler, iron or steel?" the preference is very decidedly in favor of steel. The committee say: "Those who have used it longest are most decided in their preference for it."

"In regard to the best thickness of metal for the sheets of a boiler, from 48 to 52 inches in diameter, to carry a working pressure of 130 pounds of steam, the opinion was unanimous that in the case of steel, three-eighths inch was sufficient and the best thickness to be adopted, taking all things into account, and in the case of good iron, from three-eighths to seven-sixteenths was considered the best thickness of metal."

To the question, "What is the best form of boiler for the ordinary eight-wheel American style of locomotives?" the committee find that a majority prefer the plain or straight boiler, sometimes called the telescope boiler. "Distortions of every kind," say the committee, "should be avoided in the form of the boiler whenever it is possible to do so, for the reason that the pressure within tends to change the shape or form at such points unless strengthened by stays or braces: therefore the form nearest a plain cylinder will be the strongest and require less bracing, other things being equal."

"With the use of comparatively pure water, forming no scale of consequence, a dome would, perhaps, be unnecessary where the steam-space above the water was sufficient; yet, as an opening of some kind large enough to permit access to the inside of the boiler is a necessity, such opening, as regards weakening the shell of the boiler at that point, is, perhaps, as objectionable as a dome. If the former can be made so as not to weaken the boiler, there is no reason why the dome cannot be attached in such a way as to be equally as strong at that point by flanging the sheet upward inside the dome and the addition of a ring of suitable proportions riveted to the inside of the boiler at the foot or flange of the dome."

To the question, "At what point on a straight boiler should the dome be situated to give the best results, all things considered?" not much difference of opinion is expressed in the answers sent to the committee. "All agree that it should be either directly over the tube-sheet of the fire-box or at some point between that and the middle of the length of the boiler. There seems, however, to be no good reason for locating the center of the dome any further forward than the tube-sheet in the ordinary eight-wheel locomotives, for the reason that it is desirable to carry as much of the weight of the boiler on the drivers as possible and also that that point is the most central from the points where steam is generated."

The best material for fire-box sheets? The testimony is unanimous in favor of steel.

On the subject of ruptures the committee say: "Mr. Woodcock, of the Central Railroad Co. of New Jersey, mentions one case of a rupture of a side sheet while the boiler was being filled with warm water"—the first case of the kind coming to the notice of the committee. After considering Mr. Woodcock's account of this novel occurrence the committee submit the following explanation: "The sheets of the fire-box and the mud-ring having cooled off to about the temperature of the surrounding atmosphere, when water at a considerably higher temperature than the mud-ring was allowed to fill the water-space, and as it rose upward along the sheet, the latter, being thin, soon became of the temperature of the water in contact with it, and expanded in proportion to its temperature, while the much larger body of metal remained comparatively cold, and, being cold, would be shorter than on the line which had become warm from the water in contact."

As a remedy for ruptures, corrugations or channels in the sheets at points liable to such strains are recommended.

The cost of repairs of boilers, the committee report, is very largely influenced by the character of the water used in them; and the committee believe "that it would be economy in the end to spend comparatively large sums of money in many instances in order to procure water that is free from ingredients forming these injurious and objectionable deposits."

In relation to cleaning out boilers the drift of sentiment seemed to be against blowing off, and in favor of allowing the boilers to cool down and then to wash them out with warm water from hose.

CULTIVATING THE YANKEE PROCLIVITY.—A "Whittling School" has been opened in Boston, with the design of familiarizing boys with the use of tools. There are between 30 and 40 pupils, and more applicants than can be accommodated. The tuition is free, and practical woodcutters are engaged to give instruction. The course includes 24 lessons, and is only designed to direct the talents of natural "whittlers"—not to make finished workmen.

SCIENTIFIC PROGRESS.

The "Challenger" Investigations.

Those who have been waiting for the official record of the famous *Challenger* deep-sea explorations can now be gratified by a work published in two volumes by Harper & Bros., of New York, which is entitled "The Atlantic," and gives a preliminary account of the general results of the exploring voyage of H. M. S. *Challenger*, during the year 1873, and the early part of the year 1876. The author is Sir Wyville Thompson. The descriptions of methods employed and locations explored is accurate, and the results are fully detailed.

By means of constant use of the trawl it was found that while vegetable life ceased to exist at a depth of about 150 fathoms, no depths were too deep for the presence of animal life. The absence of light, and the presence of cold which comes very close to the freezing point, do not appear to be insurmountable objections. Of course the types of life are low at great depths, consisting largely of *Foraminifera*, of which the minute *Globigerina* form an important part. So numerous are these little animals that from 500 down to 2,000 fathoms the sea bottom is invariably composed of what is called "globigerina ooze," consisting of the shells of globigerina. So that at these depths the sea is at the present time, as it has been for ages past, laying down a deposit of chalk exactly similar to that which makes its appearance in England. At the depth, however, of 2,500 fathoms or more, the bottom is a pure red clay, from which the carbonate of lime has entirely disappeared. Sponges and stalked crinoids are found in the deep-sea fauna, but it is mainly composed of very minute organisms. An entirely new family of these was discovered and named after the ship, *Challengerida*.

But the most important results were obtained from the observations made upon Atlantic currents and upon the temperature of the water at different depths. These two subjects are so closely related that neither can be properly understood without reference to the other. The fact that the temperature at 1,000 fathoms depth may be several degrees higher at one point than at another is due entirely to the currents. Were the waters stationary there would be uniform temperature throughout the ocean at the same depth and in the same latitude. It would also be true that the water would be hotter at the equator than anywhere else. But with a surface temperature from 25° to 27° centigrade, at a depth of 300 fathoms the thermometer has fallen lower than it does either north or south of the equator. The isotherm of 4° C., which in latitude 22° N. lies at a depth of 700 fathoms, has at the equator risen within 300 fathoms of the surface. South of the equator again it falls to a depth of 400 fathoms. The simple explanation of this is that Arctic and Antarctic under-currents are flowing toward the equator and rise there in order to replace the water drawn away by surface currents toward the poles. These deep under-currents are colder in the South Atlantic than in the North, for the reason that the great South Atlantic basin of which we have spoken opens out much more freely toward the pole. One curious circumstance will strike the reader, and that is that "the mean bottom temperature of the seven deep soundings (in that part of the ocean) is 0.4° C." and in some places goes as low as 0.6° C., which is equivalent to 31° F., or one degree below the freezing point.

PRIZE BLOWPIPE APPARATUS.—Some months ago we announced a prize of \$250, offered by the English Society of Arts for the best set of blowpipe, in a case, which could be sold for one guinea. The prize has been awarded to Messrs. Letcher Bros., of England, and they have deposited a standard box with the Society of Arts, which the recipients of the prize undertake shall be equaled by every box sent out. The apparatus and reagents are contained in a stained deal box, 10½ inches by 4½ inches by 3½ inches, which weighs, when full 3 pounds 9½ ounces. The box is provided with lock and key. It contains 42 articles—blowpipe, spirit-lamp, grease-lamp, hammer, anvil, pestle and guard, platinum forceps, brass forceps, lamp tweezers, test tube holder, chisel, magnet, file, scissors, cupel striker, hone spatula, platinum wire, platinum foil, tin foil, magnesium ribbon, pastille and cupel holder, charcoal pastilles, boiling dish, open tubes, closed tubes, glass rod, blue glass, litmus paper, turmeric paper, Brazil wood paper, soda paper, carbonate of soda, microcosmic salt, borax, bone ash, fluor-spar, assay lead, nitrate of cobalt, bisulphate of potash, oxide of copper, chloride of silver, and potassium iodide and sulphur. The packing is so arranged that the greater part of the apparatus and reagents are contained in a wooden block, with a variety of holes and recesses, each receiving a separate article. It is, therefore, simply necessary to lift out the block and everything is set free, for none of the pieces of apparatus in any way interfere with each other. The repacking is effected quickly and easily, as each article fits into its own place and an unfilled opening at once indicates that something is missing. If ordinary care is used, therefore, the traveler need not be afraid of leaving anything behind. No paper, wadding or pads are required and yet the contents of the box are securely packed.

Experiments on Color Blindness.

A valuable note has been presented to the Royal Academy of Sciences of Belgium by Prof. J. Delboen and D. Spring on natural and artificial color blindness. In order to explain the curious phenomenon of color blindness, or Daltonism, Young and Helmholtz have formulated the following hypothesis: The eye possesses three kinds of nerve elements, which, excited separately, cause the sensations of red, green or violet, these colors therefore being the subjective fundamental ones. The colors of the spectrum as well as compound colors would accordingly have the property of exciting, simultaneously, but in varying proportions, each one of these specific energies; red, for instance, would only feebly affect the violet and green elements, but would strongly agitate the red ones. It would be understood from this theory that no natural color, however it may be, even though it were one of the colors of the spectrum, which are acknowledged to be the purest we know, would create a truly simple sensation; the colors seen always comprise red, green or violet, although the true color may contain only one or two of them. This hypothesis applied to color blindness would give as the cause of the phenomenon the absence of one or two of these three energies, the most frequent being that of the red. Without discussing the objections which may be made against this hypothesis, a modification may be added which naturally suggests itself. It is possible that with those who are color blind the red elemental nerves are not entirely paralyzed, but that the green and violet simply predominate. If this supposition were correct, it would follow that in placing between the eye of one color blind and the light a transparent substance colored red, it would be possible to establish the equilibrium, because by such means a part of the green and violet rays is extinguished. The substance first used was fuchsine. Experiments were made with silk ribbons, chosen by a person who was color blind. It was notably a bright red which he could not distinguish from a certain brown, and a violet which made upon him the same impression as blue. The interposition of fuchsine prism produced a remarkable effect upon all color-blind persons examined. The colors which they confounded usually were not only notably different, but the color and tone of blue or brown remained almost intact; while violet, and especially red, acquired an aspect and a brilliancy entirely unknown to them.

TRANSMISSION OF SOUND.—*Nature* says that Prof. Hughes, the well-known inventor of the type-printing apparatus so largely employed on the Continent, has made the wonderful discovery that some bodies are sensitive to sound as selenium is sensitive to light. If such a body be placed in the circuit of a small battery it will be so affected by the sonorous vibrations when spoken to as to replace entirely the transmitter of a Bell telephone. Conversation, music, and all the sounds transmitted by an ordinary telephone are easily reproduced. A mere scratch with the finger-nail, or a touch with the soft part of a feather, is distinctly transmitted. The sonorous vibrations produce strains in the conductor, which cause variations in the resistance of the circuit.

THE TOTAL ECLIPSE OF THE SUN.—On the 29th of July next a total eclipse of the sun takes place under such circumstances as to present opportunities that occur scarcely once in a generation, for the study of some of the most interesting phenomena with which astronomers have to do. The path of the totality of this eclipse runs diagonally across the center of the United States from Montana to Texas, and is somewhere about 140 miles wide. Many of the best points for observing the eclipse are therefore directly accessible by railroad, and several expeditions might be sent out fully equipped to as many different points, without spending so much money upon them all, as it would ordinarily take to equip a single expedition to a more distant point.

A WANING STAR.—The "new star" which appeared in Cygnus so suddenly in November, 1876, has now fallen to a small ninth magnitude star; while its spectrum, which, when it was brightest, was a continuous one, with bright lines and bands, has become exactly like that of a faint nebula, consisting of only one single line in the green. According to Lord Lindsay's careful measurements, the wave-length of this line on Augstrom's scale is 4,986, which coincides sensibly with the strongest line in the spectrum of nitrogen.

AN ATMOSPHERE FOR MERCURY.—Prof. Watson, of Ann Harbor, agrees with Prof. Peters, of Hamilton College Observatory, in finding that his observations on the transit of Mercury, indicate an atmosphere about that planet. He however insists that the time of the contact with the sun shows perturbations due to some force not recognized among the planets commonly accepted, and that Leverrier's planet Vulcan is responsible. He does not expect that Vulcan will be seen until 1885.

LONGITUDE.—A detachment of officers of the U. S. Hydrographic office are now engaged, with the aid of the Brazilian Submarine Telegraph Company's cables from Lisbon to Pernambuco, in determining the longitude of the principal South American cities; notably Pernambuco, Bahia, Rio de Janeiro, Buenos Ayres and Valparaiso.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

COPPER.—*Ledger*, June 1: At the Newton mine improvements are being pushed. Next month they will take the water out of the shaft and resume the extraction of ore. Heretofore roasting operations have been conducted in the open air. That the fumes may not be a source of annoyance to the neighborhood, a dozen roasting furnaces are in course of erection, and the smoke from these will be destroyed by condensation.

PLYMOUTH.—Work at the Hite mine has ceased, the ore being too poor to pay. The Phenix holds its own well. The Alpine mine has been sold to satisfy a judgment held against it by the Bank of California, which bought it in. The ten-stamp mill of the Montecard mine is running on good ore.

CALAVERAS.

GWYN MINE.—*Chronicle*, June 1: The sinking of the shaft here an additional hundred feet, for the purpose of opening a level at the depth of 1,500 feet, is about completed. The shaft is cutting the largest and best ore body yet discovered in the mine. So far as the permanency of the ledge is concerned, that was established years ago; still, the fact that no drifting will have to be done to find the ore body in the 1500 level is encouraging. The batteries are kept engaged on rock from the 1400 stopes, the yield of the mine continuing steadily at largely remunerative figures.

UPPER COUNTRY.—Champion, at West Point, stoping. Excellent rock and lots of it. San Bruno, Mosquito, closed down. Blue Jay driving ahead with customary vigor. Plenty of good rock. The new machinery on the San Joaquin has been started up and works well. Very active operations on the "John the Butcher" mine. Banner still lying idle.

EL DORADO.

PLACERVILLE QUARTZ CO.—*Mountain Democrat*, June 1: Last week a survey of this mine, formerly the Pacific, was made, including the new shaft and the drifts and stopes on the 300 level, and the tunnel through which the old incline was worked. A cave at the head of the tunnel, which defied the efforts of former owners to penetrate, and which resulted in the sinking of what is known as the new shaft, has been caught up and securely timbered to the hanging wall. The head of the incline is open, and, though full of water, it appears to be all sound. Operations have been commenced to drift from the shaft, at the depth of 220 feet, to the incline. This will afford the necessary ventilation, and the work of stoping can at once be proceeded with. From the shaft, on the 300 level, there are four drifts, north, south, east and west. There is also a north drift from the west drift. The west drift runs through to the slate. The east drift, 90 feet in length, is all in green stone, and in this, as well as in the west drift the walls are full of quartz stringers, sometimes reaching the dimensions of respectable ledges. Some stoping has been done in the north drift and a winze sunk about 20 feet. In the bottom, where the ledge is four feet wide, there is lots of free gold in sight. From a blast put in here, Monday, some very rich specimens were obtained. The dust from the drill-hole prospected splendidly. Prof. Price, while here, made a careful examination of the mine, and left satisfied with its prospects.

FRESNO.

STRUCK PAY DIRT.—*Reporter*, May 25: Duff and Blair have been prospecting during the winter near the old adobe crossing of the San Joaquin, about 10 miles from the toll house, and have struck what they believe to be a real bonanza of pay dirt. They will build a ditch some two miles long, much of it flume, which will cost about \$1,500, and hope to be able to begin washing by the middle of June.

INYO.

NEW COSO MINE.—*Coso News*, June 1: One of the new furnaces here was started on Monday, May 20th, and has been running ever since, with some interruptions caused by labor troubles and the inexperience of some few of the employees. However, they have done very well. Up to this morning at 7 o'clock, there have been smelted about 200 tons of ore, producing 32 tons of bullion, the gross value of which here (lead and silver) amounts to \$14,006.46. The large, or 50-ton (No. 3) will probably be started some time next week, and perhaps the third one (No. 2). The amount of coal that has been used is about 25 to 30 bushels per ton of ore, 5% of iron ore, very little lime, and about 25% of slag. An improvement on these figures may be expected next week, as Mr. Williams will have become better acquainted with the ores and the efficiency of the furnaces.

MONOC CONSOLIDATED shipped 20 tons of their rich bullion last Thursday, and had remaining at the furnaces 16 to 18 tons, all of which was the product of the furnaces for the preceding three days—the average being about 12 tons per day. Both furnaces are running and turning out bullion daily at about that rate, the bullion retaining its usual high grade. They are now taking out large quantities of ore from the levels 50 feet below the Confidence level, a large por-

tion of which carries the rich horn-silver, the native chloride of silver, or kerargyrite. Sinking on the ore body on the 1000 level is progressing satisfactorily, and is looking splendidly, hiding fair to exceed the expectations of all.

DEFIANCE.—Both the furnaces started up last Tuesday morning, under the direction of John S. Gorman, and are running nicely. It is believed that ore can be had from the mines in sufficient quantities to supply the furnaces for a long time.

LAKE.

GREAT WESTERN QUICKSILVER MINE.—*Lake County Bee*, May 28: The shipments from the mine, during winter, have averaged 450 flasks per month, and it is expected that 600 flasks per month will be shipped during spring and summer. Mr. Rocca, Superintendent, is putting up wooden furnaces with glass roofing. His nephew has recently arrived from Italy and will remain at the mines. Mr. Robert Armstrong has taken charge of the adobe yard.

NEVADA.

OPENING AN OLD CHANNEL.—*Transcript*, June 4: A company has been formed for tapping the Blue lead under the Town Talk bill. The tunnel is now in 200 feet, with 300 feet more to run before reaching the channel, which is expected to be rich. A perpendicular shaft is to be sunk from the top, to strike the tunnel at the end of the 500 feet, which will afford a free circulation of air for the miners in taking out the gravel.

STARTING OPERATIONS ON THE BYRNE MINE.—Robert M. Fryer, Superintendent of this very valuable property, informs us that work will be started here on the first of June, after which it will be pushed vigorously and without interruption, some 40 or 50 men being employed. The chances for opening up a large paying estate here are equal to any in the county, the gold being here, the company strong and the management good.

PLACER.

RECONSTRUCTION.—*Dutch Flat Forum*, May 27: This is the name of a mining claim located at the mouth of Canyon creek, on the American river, embracing a large piece of ground known as Pickering bar. Being a river mine it can only be worked during the low stage of the water, and as that season is close at hand six men have been engaged for the past few weeks making preparations to have this mine worked through nearly all of the processes known to ancient and modern river mining. Wing dams, pits sunk to bedrock, in which force suction and Chinese pumps will be operated by over or undershot wheels, also tail races, tunnels, etc., will be brought into requisition. This mine is expected to make a good record, as late last fall a prospect hole was sunk to bedrock, from which a small amount of gravel was taken, (heretofore being driven out by the rising of the river,) which yielded \$80 to the car-load. The proprietors are White, Thomas & Co., most of whom reside at Gold Run.

POVERTY BAR.—In the early days of California this bar, on the Middle Fork of the American river, was a place of great repute. Of late years it has been neglected. Now, however, some old miners have gone in again, traced up and found the old pay dirt more extensively than they expected, and are, at present, opening a claim that may re-establish the reputation of the old mining camp. The names of the men of the company are Early, Marks, Cochrane, Wilson and Carroll.

IOWA HILL MINES.—The Independent hill mining claim has been sold to a San Francisco company for \$5,800. The Morning Star mine shut down on Monday to clean-up. Good returns are expected. The Enterprise mine, under the superintendency of D. W. Spear, is progressing finely. They will run two weeks longer and then clean-up.

THE BRUSHY mine has its location two miles south of Gold Run, contains 15 acres of gravel, and is owned by Everhart & Bros. This mine, which has been hydraulic since January 26th, employs nine men and uses 200 inches of water. Several clean-ups have been made, with favorable results.

SHASTA.

FURNACEVILLE.—Reading *Independent*, May 30: The Afterthought mine has shut down, for the reason that the buildings were not sufficiently large to shelter the vast amount of machinery and works that has been necessary to have to work the ore. The carpenters are now busy at work, and the mill will start up again in a few days with everything prepared for a continued work.

SIERRA.

MONTE CRISTO.—*Downieville Messenger*, June 1: The tunnels, with the exception of the Basalt Rock Co., who are washing tailings, and the Empire, sinking an incline into prospected ground, are all paying; some of them handsomely. Towle is yet driving ahead at Echo City in the belief that he will yet, contrary to popular belief, strike a paying channel. Brady & Bro. have returned to Fir Cap, and will work tailings of the Shamrock Co. this summer, some of whose dirt was wonderfully rich. J. Billings, at Sebastopol, is getting good pay in the old Pioneer ground, having lately taken out \$500 from a place less than five feet square. Some parties have lately relocated the old Alma ground, into which they will drive a tunnel. Jas. Alexander, at Reese's ravine, is pipping with remunerative prospects. At Little Grizzly the Los Angeles Co., to whom the mines at that place were bonded for \$60,000 last fall, with privilege of prospecting them until July next,

are driving their main tunnel across the channel expecting soon to strike rock. A shaft 12 feet deep was sunk on this channel some time since, from the bottom of which a drift of 50 feet was run, showing fine prospects with the rock raising slowly towards the main tunnel.

TRINITY.

NUCKET.—*Journal*, June 1: Prater & Fisher found a specimen of heavy gold in their claim, opposite the Arkansas dam, Tuesday of last week. The piece weighed \$92 and was nearly solid gold, there being but two specks of quartz on it. This claim and that of Chapman & Fisher, adjoining, has furnished a number of nice specimens in times past.

PROSPECTING.—Mr. A. L. McWhorter, of Burnt ranch, was in town, this week, and speaks hopefully of the prospects on Lower Trinity. From him we learn that Dr. Fonda is engaged in prospecting Denver bar, by sinking a shaft, and if satisfactory results are obtained, work will forthwith be commenced on a ditch to that point. A company has already been organized for this purpose and \$10,000 capital paid up.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, June 5: There is no change in any of the ore-producing sections of the mine, or the quantity of ore extracted and milled. The ore breasts and stopes on the 1650 and 1600 levels continue to show well. Sinking the joint Ophir winze below the 1900 level on the north line is making good progress, considering the extreme hardness of the rock. A donkey engine is being erected to do the hoisting from this winze. The retimbering of the Consolidated shaft was much impeded by the striking of a pocket of water at a point about 75 feet below the surface, during the first part of the week. This water pouring into the shaft turned the current of air downward, which greatly increased the heat and caused the delay. It has now, however, entirely drained, and the guides are now in the shaft down to the 500 level, and work on the lower section of the shaft, commencing at the 1500 station, has been commenced and is making good progress.

BELCHER.—The east drift on the 2360 level is steadily advancing toward the ore vein, and will have 60 feet or more to run to reach it. The north drift on this level, running to connect with the south drift from the Crown Point, is advancing at the rate of five feet per day, the face in very favorable ground.

ALTA.—Sinking the main shaft is being pushed steadily ahead, the bottom in good blasting ground, and the flow of water steady and strong. The north drift on the west side of the ore vein on the 1250 level is now in 310 feet, and is being pushed vigorously forward to open up that portion of the mine.

CON. VIRGINIA.—Daily yield, 350 tons of ore, which is being crushed as fast as it is extracted. The drift south from the California mine on the 1950 level has reached the north line, and is now being driven southward to connect with the joint Best & Belcher winze. This connection, when completed, will thoroughly ventilate the 1950 level of the mine. Sinking the winze in the west ore body below the 1650 level is making good progress. West crosscut from winze No. 1 on this level is still advancing, the face in good ore. A drift south has been started from the east crosscut on this level, the face of which is in excellent ore. Repairing the main south drift connecting with the Gould & Curry mine on the 1550 level is going steadily forward.

OPHIR.—A station is being cut out in the winze, on the ore vein at a depth of 100 feet below the 1900 level, for the purpose of starting a drift westward to connect with the east drift from the 2000 station. The full size of this station is in good ore, but it is more than likely that it is but a very short distance to the westward at that point to the west side of the ore vein, as the winze in its descent cut what was evidently the west wall some 50 feet above the station, and the general features of the quartz indicated an almost perpendicular position of the ore vein. The ore which is being taken from the winze below the 1900 level is being milled as fast as it is extracted, and will go far toward helping to pay the running expenses of the mine. The repairs to the main shaft above the 1465 level are being pushed steadily ahead.

SAVAGE.—The east drift on the 1640 level is now in a distance of 224 feet, the face still in solid quartz. This gives a distance already penetrated by this drift of 78 feet of quartz and ore. This shows that the ledge at that point has great width, strength and promise, having cut in its course many bunches of excellent ore, and the general features being such as to warrant its extent both above and below this level in a well-defined fissure.

WELLS-FARGO.—This mine has again started up under the able superintendence of Mr. J. H. Crossman, and is to be now developed in a manner commensurate with its real worth. The location could hardly be a better one, being on a due north and south line with the Alta, Julia and the east ledge in the Consolidated Virginia and Ophir mines. A line of heavy croppings runs through the entire length of the claim. A double compartment shaft has been sunk to a depth of 528 feet. At the depth of 60 feet below the surface a fine vein of mineral bearing quartz, assaying from \$20 to \$30 per ton, five to eight feet in width, was passed through. It is now the intention to retimber the shaft and put the machinery all in good working order, and then to open a station and

start a drift east to again cut and prospect the fine ledge passed through near the surface.

YELLOW JACKET.—The north winze on the 2200 level is down 347 feet on the slope; hot-ton in hard, dry ground. The dam on the 1730 level operates finely thus far, the water raising to the vertical height of 130 feet in the incline. This obviates the necessity and work of pumping about 60,000 gallons of water daily. The new shaft is down 1484 feet, with the bottom still in hard, tough working ground. The new pump engine and machinery is approaching completion, as also is the blacksmith shop and other outside arrangements.

SIERRA NEVADA.—The east crosscut on the 1700 level is still continued, the face in porphyry and vein matter, showing no important changes. The west drift at the 2000 station of the south winze has reached what appears to be the west wall of the vein and has been discontinued. A diamond drill will, however, be run some distance further west to make sure that the wall has been actually reached.

SILVER HILL.—Sinking the main incline is making good progress, the bottom in fair blasting ground and the water giving but little trouble. The east drift on the 900 level is being pushed vigorously forward to reach the main ledge.

BEST & BELCHER.—The south drift from the bottom of the joint winze on the 1900 level is steadily advancing, the face in very favorable quartz and vein matter.

JUSTICE.—The Pacific mill was shut down day before yesterday, and the shipment of what ore is being taken out to the Santiago mill, on the Carson river, was commenced. There is but little change in any of the ore-producing sections of the mine, there still being considerable quantities of low-grade ore in sight.

JULIA CON.—East crosscut No. 1, on the 2000 level, 100 feet south of the shaft, is being vigorously pushed forward, the face in vein matter, and is following up the course of the diamond drill recently used on that level.

OVERMAN.—Sinking the double incline winze below the 1400 level is proceeding as usual, the bottom in very favorable quartz and vein matter. The flow of water is still quite strong.

UTAH.—The south lateral drift on the 1350 level has been driven steadily ahead and is now within eight or ten feet of the south line of the mine, the face in lively vein matter. This drift will be pushed ahead until a connection is completed with the Sierra Nevada mine, which is very necessary for ventilation purposes.

GOULD & CURRY.—Sinking the main incline below the 1800 level is making steady though slow progress, on account of the great heat. The connecting drift on the 1600 level with the Savage is being repaired, in the hopes that it will assist in ventilating and cooling the lower levels of the mine.

UNION CON.—Enlarging and retimbering the north drift, connecting the 1600 level with the Sierra Nevada, is being pushed vigorously forward, in order to increase, if possible, the circulation of air through that portion of the mine.

HALE & NORCROSS.—The pumps have been kept running steadily during the week, but owing to changes at the Savage, and but the pumps of one mine being run a portion of the time, the water has been held at a distance of 20 feet below the 2100 level, without trying to make any considerable gain in reducing the flow.

MEXICAN.—The joint Union Con. east drift on the 1600 level is being steadily advanced without any change of value to record, the face being still in porphyry.

BULLION.—Sinking the main incline below the 1840 level is making the heat of progress, the bottom in good blasting ground. The east drift on the 1840 level is being steadily pushed ahead, the face in quartz and vein matter.

LADY WASHINGTON.—The face of the north drift on the 1150 level continues in fine quartz, showing bunches of excellent ore. The ore stopes opened by the Justice directly on the south line of the mine on the 1000 level are opening up handsomely, and are showing an excellent face of good ore.

CHOLLAR-COMBINATION SHAFT.—Sinking the combination Chollar-Savage-Norcross shaft has made fair progress during the week, taking into consideration the extreme hardness of the rock in the bottom a large portion of the time, and the steady flow of water, which averages about 41,000 gallons per day.

LEVATHAN.—The main drift east at the 765 level from the incline is now in about 25 feet, and is evidently nearing the vein, judging from the good stringers or feeders of quartz met with in the face of the drift.

CON. IMPERIAL.—The enlarging of the main north and south drift on the 2400 level, preparatory to crosscutting both east and west at several different points, is going vigorously forward.

CROWN POINT RAVINE.—Sinking the shaft is going steadily forward as usual. The rock at the bottom is porphyry of a medium hardness which blasts and works well.

TROJAN.—The ore stopes on the 400 and 450 levels are showing well and are yielding a considerable quantity of good ore, which is being shipped to the Vivian mill, on the Carson river, for reduction.

ELY DISTRICT.

THE ALPS.—*Pioche Record*, May 25: The drift on the 1200 level of the Mazaepa has been run west 25 feet during the week. Winze below the 1200 is in on water, with more or less ore throughout. Mine producing considerable quantities of ore from the 7th, 8th, 9th and

Total rain during the season, from July 1, 1877. 35.17 in

Protection to Levees.

[Written for the Press by W. M. RYER, M. D.]

We hold these truths to be within the observation of all persons, that earth, the deposit of rivers, when thrown up and subjected to the action of waves and currents of water does gradually or suddenly wear or wash away. That the smallest current of water, though no wider than the hand, cuts a channel through earth that has been undisturbed for ages. That larger streams with currents and waves dissolve and cut away every earthly restraint to their course.

If we go to the fields we see the ground channelled with water courses. If we go on the hillside we find them furrowed by the water of rains or springs. There is no fact in nature more clearly presented to us than this, *running water washes away any earth that may be an obstacle to its course.*

With this natural law before us as daily witnessed by all persons, it becomes a wonder why levees have been constructed without reference to it. The levees of the Sacramento river are composed of alluvium of excellent quality for the purpose; they were thrown up at an immense cost, and were expected to restrain the waves and currents of a swift running river, and this with the earth in direct contact with the water. If earth never yet resisted currents of water, why should we have expected it to do so on the Sacramento? Earth, loosely thrown up, we have believed would protect millions of property, and because it has failed to do so we despair and declare the reclamation of the best land in the State impracticable!

Stopping Short of Success.

We have demanded success without having fulfilled the requirements which command success; on the other hand, with ages of experience before us, we have refused to learn, and have stopped our labors omitting that which would have ensured success. Levees of proper height, with sufficient base, and composed of as good material as levees which have stood the action of the waves of the sea or the currents of rivers for centuries in Europe, have been constructed on the Sacramento river. When the river was two feet higher than the bank these levees commenced to waste and cut away, and the owners placed thousands of sacks of earth to protect them, thus attempting to do under unfavorable circumstances that which could have been done by a different and more economical way at a time when there was no water present. The immense expense and effort made to protect the levees during the existence of high water, seems to show that the protection of levees is believed a necessity even by those who would not foresee when constructing their levees, that the bare earth subjected to a current will surely be washed away.

Good Material for Levees.

The levees of the Sacramento have been constructed of alluvium of a weighty and cohesive nature; and they have been built upon foundations not liable to settle; and on a river whose banks are exceptionally permanent. The deltas of the rivers of the continent in no case present more favorable conditions for reclamation than does the Sacramento; and yet these sustain levees that neither the freshets of rivers or the storms of the sea do wash away. Now why should disaster visit one, and success the other? The answer is brief and simple. The Sacramento levees were not covered or protected in any place; but all the levees on the continent are covered and protected as high as waves or currents can come.

What May be used in Protecting Levees.

Upon the manner of protecting levees we do not profess to be expert, yet the importance of the subject demands all the space which the *RURAL PRESS* can accord to us, and we give our observations as follows: The question of expense is in California a prime consideration, we therefore dismiss stone and iron as material not available. Redwood timber is endurable, but in a sloping levee, the carpentering would have to be done most perfectly; and even then, this covering would be liable to get out of repair when most needed. The buoyancy of timber together with the action of waves, makes it liable to break the attachments and float away. This was manifest last winter from the loosening effects of waves and the lifting power of water, raising whole lines of fences and floating them away. By far the cheapest and most used material for protecting levees on the lowlands of Europe, is the willow, pine and other brush too small for fire wood, and of but little use except for this purpose. For the purposes of protecting banks and levees there is no material in such general use as the small twigs of willow and other trees which grow upon the banks of streams. These the Dutchmen carefully save and transport in boats to the levees they wish to protect; and these the Sacramento river levee builders have always burned, and then have expended thousands upon building levees, which, unprotected, were as certain to wash away as that water will wash uncovered earth.

In constructing a levee let it never be forgotten that the protecting properties of a levee are only in proportion to the weakest part of the

levee; we would therefore impress the necessity of the most careful attention to all the details, and the most thorough watching, that every part is well done; for where water is your adversary, there can be no compromise. The Hollander takes twigs of willow, sycamore, pine, alder, etc. These are often brought down the Rhine in boats, even from 50 to 100 miles. These twigs, from one-quarter to one inch in diameter, are sufficiently exposed and dried, so they will not grow, for no trees should grow upon a levee exposed to currents; although growing trees are desirable outside of a levee and on the banks as a protection from waves and currents.

How the Small Branches of Trees are Used.

Care is taken that nothing much thicker than one inch is used, and these are carefully laid, each twig parallel and as close to the other as possible, the lengthway of every twig extending and forming a dense mat, with others similarly placed from the high-water line to the base of the levee. Every twig is most carefully placed on the outside of the levee, until the mat, or

ramento has thus been protected. It is quite certain that five men can thatch and firmly cover with twigs as much levee as 100 men can build; such being the case, how strange that any should thus neglect to protect that which they build. We Americans build houses of brick, put on iron doors, and go to vast expense in making houses fire-proof, but we invariably make every partition in the house of wood and leave them hollow, and then wonder why our fire-proof houses burn. We build levees, leave them exposed to the direct action of waves and currents, and then declare that levees cannot be built that will stand the currents of the Sacramento. The banks of the Sacramento in no place washed away last winter sufficient to cause a break in any levee; therefore the fault was not in the foundation. On the other hand the levees commenced cutting away when the water was but two feet on their base, and continued to cut as the water became higher, until the breaks occurred.

Land in Holland worth \$400 and more per acre, and no better than our Sacramento over-

FACE OF LEVEE, SHOWING PEGS AND WIRE LACINGS.

thatch, is from six to nine inches in thickness. Each twig is transverse to the axis of the levee and none run on a line with the axis.

When the thatching is thus laid on the outside of the levee, the workmen proceed to secure it. This they do with pegs, two or three feet long, with a diameter of two or three inches. These pegs are driven down, leaving enough of the top exposed for the workmen to twist a wire or willow over them. When this is done, the pegs are driven down, thus compacting the mass of thatching and pressing it tightly on the levee.

Every peg is placed about 18 inches from the other, and the wire or willow, extending to its neighbors, holds the thatch so firmly that currents or waves cannot displace them, and so long as this thatch holds together, no levee can wash away.

When the levee is thus thatched six or more

flowed land, is there protected from the sea, whose surface is 14 feet above the land, and whose waves go many feet higher. Day and night the sea breaks its force upon these levees and centuries pass away, but the levees continue as barriers to the water. These levees are constructed of earth no firmer than the earth on the banks of the Sacramento. Twigs of willow and other trees are made effectual in protecting the levees of that country, why should they not be in this?

The engraving on this page will give the reader an idea of the practical construction of the style of levee protection which is practiced in Holland, and proposed for use in this State. One cut shows a section of the levee with the pegs reaching through the thatch into the earth of the levee. The other cut shows a view of the face of the thatch with the ends of the pegs and the connecting wires. The whole construc-

SECTION OF LEVEE, SHOWING METHOD OF PEGGING THE THATCH.

inches, properly pegged and wired, then six inches of earth may be thrown upon it to protect the thatch from the tramp of cattle and fire. A levee thus protected will endure four years. Then it may be removed, provided a proper grass may not have grown upon it, sufficient to protect it from currents or waves.

Every tree, hush and such grasses as alfalfa (with its single root) growing upon a levee, cause a whirl of water around them during a freshet, which rapidly cuts down a levee.

The outside of a levee should be at all times open to inspection, and, therefore, nothing but grasses with matted roots should be permitted to grow upon it.

No greater mistake can be made than the seeding of alfalfa and the allowing of weeds to grow upon the levee, for these harbor and feed animals which burrow in the levee, and when the current is rapid, the water whirled around the alfalfa and weeds and cuts away the earth.

Simple but Effectual Protection.

With a manner of protection so simple, and which ages of experience has shown to be effectual (for two-thirds of the levees of the Continent have been thus protected for centuries), is it not strange that not one levee on the Sac-

Mining about Clifton.

A correspondent of the *Tucson Star* thus describes the various branches of mining in progress about Clifton, the principal mining center of southeastern Arizona.

The Longfellow copper mining company's smelter is situated in the triangle between two steep mountains, on the west bank of the San Francisco river, and nine miles distant from the mine. These works (from Patterson, New Jersey), cost, it is estimated, \$100,000, a considerable part of which sum was "wasted," as the Superintendent said. The works turn out 5,000 lbs. copper in bars of 250 lbs. average weight. This company employ some 200 men at the mine and works, principally Mexicans, with a considerable number of freighters and coal-burners, in the mountain adjacent. Average of wages paid here, \$2 a day, in L. C. M. Co.'s "checks" or promissory notes, printed on stout red cloth, and payable entirely in merchandise at the Company's store in Clifton, or if a considerable amount, half in greenbacks and half merchandise, at M. Lisinsky's store in Silver City, N. M., 120 miles distant. The copper thus extracted is shipped via Silver City to El Moro, Colorado, and thence to Baltimore, Md., for seven cents a pound, at which market the bars are worth at present rates, 18 cents per pound. Placer mines are being worked around and about Clifton on the river San Francisco. From some of them 50 cents to the pan has been taken out, but \$2.50 a day is the average, which about pays a man's way in that remote corner of Arizona. The gold thus extracted goes \$17 to the ounce. Above Clifton there are several American mining in hatea and wheelbarrow diggings. From the latter \$5 per day have been taken. The Bentz brothers are preparing to ground-sluice there, and Pinkard & Johnston are about to commence hydraulicing; they expect to find several old channels of the river in the present bank. Others are turning over the gravel benches in search of the glittering treasure. There are three signs on Longfellow street, one reads "Postoffice;" the second, "Strangers are not admitted to eat with the workmen;" third, "Attention! this is not a hotel, it is private." A neat store, well filled, is the rallying point and center of commerce, where everything is kept, from a bottle of whisky to a paper of needles. Butchering morn is the social event in Clifton, and as it happens only at daybreak every second morning, considerable scuffling takes place for beef and sheep meat at 12½ cents per pound. There is a fine opportunity at Clifton for a baker, with 100 men to supply who do not care to cook for themselves and who deplore the mess system; a number of heads of sheep or beef cattle could also be kept near town on the side grasses of the vicinity, and a fair profit made from butchering them at Clifton.

Giant Powder in a Cook Stove.

Giant powder cartridges are articles that ought to be handled with considerable caution. This is a self-evident proposition, and has been demonstrated by numerous examples. The latest affirmative test on this subject is furnished by Billy Watson, whose cabin did adorn the slope of the Newark Valley range, but at the present time is scattered over considerable territory. Billy has been absent from his humble abode for some weeks on a prospecting trip out to Muncey creek and vicinity, and before his departure placed half a dozen of the rock-rending explosives in his stove oven, in order to secure them from being spoiled by the dampness during his absence. When he returned to the domicile he was hungry, and without thinking of the contents of his stove, he built up a roaring fire, sliced off some bacon and started to put on the tea kettle. That reminded him that there was no water in the house, and seizing the pail he journeyed to the spring about 100 yards distant. It is lucky he did, for the trip probably saved his life, and gave him a chance to relate to us the inevitable sequence to that incident. We think that Billy exaggerates when he likens the explosion to an earthquake, and his statement, that that there was nothing left of his late residence but a hole in the ground is to be received *cum grano salis*. No doubt things were mixed, shook up and scattered, but his story about there not being timber enough left to furnish material for a tooth-pick, and that the stove lids lit in Ruby valley, is absurd. However, William saved the water pail, and is of the opinion that haked giant powder cartridges are a species of viands liable to raise things more effectually than a case of yeast powders. — *Evreka Sentinel*.

LEAD.—The *London Mining World* is of the opinion that the price of lead has reached its lowest point, and that the tendency will be upward in the future. To support its theory, the *World* reviews the unsettled condition of business during the last three or four years in England and America, and claims that the mines of Spain and Germany cannot be worked at a profit at the present price of the metal, and that the home consumption in this country will absorb the whole of our product. We certainly hope the predictions of the *World* may prove true, as the present price of lead is a serious impediment to the successful operation of our low-grade mines, and an advance in the price would have a tendency to promote production, and have a healthy influence on our mining industry.

tion is seen to be very simple and it has been proved to be very effective.

A GOON RECORD.—The Central City (Colorado), *Register* discourses as follows: Although one of the smallest counties, Gilpin has furnished half the yield of the State, and is increasing its production yearly. The mineral belt here is about 10 miles wide, extending into neighboring counties. The production in gold and silver, up to the present time, has been nearly \$40,000,000. Eighteen quartz mills are at present at work, turning out about \$5,000 in gold daily. In 1877 there were less than 1,500 men engaged in mining, milling and kindred pursuits, and their production amounted to \$2,300,000, or over \$1,500 for every man engaged. The prosperity has really just commenced. It is as enduring as the hills, and with the excellent facilities now afforded for transportation by the Colorado Central railway, must soon increase many fold. Mining has developed from chance, and guess-work into a grand science. The ore channels are as numerous as the veins on our hands. They were never richer, never in such trim to yield the royal metals as to-day.

Mining in Utah.

Fully 25 millions of home and foreign capital is invested in our mines, all of which when judiciously expended and honestly and economically managed, is paying a fair, and in many cases, a liberal profit. And the developments so far made show that there is room for the profitable use of four times this amount. The varied and inexhaustible wealth contained in these mountains, has so far hardly been touched. In Beaver county, the largest body of argentiferous ore in the known world has been partially uncovered, and in Washington county, so far as investigation has been carried, an amount of treasure exists which it would be difficult to over-estimate. The lack of transportation facilities in that remote region sadly retards progress, but it is not in the nature of the American people to stand at difficulties; and it is a safe thing to say that now it is shown sufficient business exists to justify the building of a railroad (to the Beaver mineral region, at least), the road will soon be forthcoming.

In that portion of the Territory, too, iron mines of really fabulous extent are in plain sight; while coal in vast fields pervade the entire Territory. It requires no great stretch of faith to see these resources, at no great distance of time, utilized, and Utah become foremost in her silver production and the equal of Pennsylvania in her iron industry. Only eight years have elapsed since capital and enterprise were first applied to the work of mining in this Territory, and perhaps not more than half that time since the work was legitimately embarked in, and the same skill, economy and correct business management applied which are necessary to success in other undertakings. Such a beginning augurs well for our future progress; and now that the Mormon scare is pretty effectually laid, and a fair field is open to all who wish to join in our useful labors, we look to see the work of development carried forward at an increased rate, and the annual output of our mines correspondingly extended. —*Salt Lake Tribune.*

Black Hills.

The total assessed valuation of this county made one year ago aggregated something over \$300,000. Of this year's assessed valuation 57 individuals and firms alone aggregate the handsome sum of upwards of \$600,000, or nearly twice the total valuation of last year. It is only within the past two years since the region around the Black Hills was settled, after much difficulty, and with considerable loss of life. Within that time what a great transformation has been effected! Deadwood is now a city containing between 4,000 and 5,000 population, with three solid banking institutions, two churches, a public school, two theaters, an evening and morning newspaper, and wholesale and retail stores of all classes equal to any that can be found in any city in the country of three times the population of Deadwood. There are now over 700 stamps in operation, and it is not unreasonable to expect that during the season 2,000 additional stamps will be up. Wealthy capitalists have come in and purchased many mines at large figures, and are now building extensive mills. Gold paying ore is being found everywhere, and new camps are being worked and discovered daily. The "helt" theory is exploded, and the gold-bearing territory will most probably prove to extend within the two branches of the Cheyenne river, an area of 1,500 square miles, sufficient to make the gold supply permanent. Our climate is delightful in summer and mild in winter, with the exception of occasional snow-storms. Our country produces good crops, both roots and cereals, in abundance, and we raised sufficient potatoes last year for our own consumption. Our grazing lands are fertile, and in another year all the necessities of life will be as cheap here as in Eastern cities. —*Lawrence Co. Times, May 11th.*

COLD AS ICE AND PURE AS CRYSTAL.—The eastern border of Independence valley is a lofty, ragged and jagged range of mountains, mainly composed of dolomite and quartzite rocks. The range is deeply indented by many dark, gloomy canyons and gorges, from each of which flows into the open valley streams of the purest spring water. At the base of the mountain, at a point nine miles east of Tuscarora, one of those springs, having a volume of about 1,500 miners' inches of water, comes roaring out, a new-horn river, as clear as glass and as cold as ice. This spring forms one of the sources of the Owyhee and in the early summer months is a favorite resort of trout, salmon trout and Columbia river salmon. At a point in the valley 15 miles to the northeast of Tuscarora there are several of the most remarkable hot springs in the State. The water of these springs, which pours out in large volume, is boiling hot and comes seething and hissing from the depths with a noise like buried thunder. Perhaps at some time in the near future an enterprising citizen may utilize these roaring cauldrons for either the purposes of irrigation or for bathing the dusty denizens of Tuscarora. —*Times-Review.*

THE *Chico Enterprise* says that the business of making lumber has fairly commenced there for the season. The Sierra Plume and Lumber Company make 40,000,000 feet of lumber annually, and has 260 miles of flumes, 200 miles of telegraph line and employ 500 hands. Chico has entered into an experiment of competing with Michigan for the Australian lumber trade.

USEFUL INFORMATION.

New Method of Protection from Rusting.

According to the *Iron Age* a process, depending like that of Prof. Barff on the formation of an unalterable magnetic oxide, for the protection of iron against oxidation, has been patented in England by Mr. George Bower, of St. Neot's. The means by which he accomplishes the desired end is, however, in every way different from that used by Prof. Barff, and which we described some months ago. It is well known to every tyro in chemistry that if we pass steam over red-hot iron the steam is decomposed, hydrogen being set free, while the oxygen goes to the iron to form the stable magnetic oxide (Fe_3O_4). On this reaction depends the process of Prof. Barff, who places the articles in a heated chamber, and then passes in superheated steam, for a time dependent, of course, on the thickness of the film required. Mr. Bower has, however, discovered a process that will most efficiently coat the iron, and at the same time simplifies the whole of the working details. The agent he employs is the oxygen of the atmosphere. The articles are placed in a chamber constructed of fire-brick or iron, and fitted with inlet and outlet pipes; air is passed in and the chamber closed as completely as possible. The temperature is then raised to the requisite degree, which varies with the nature of the articles, and which ranges from a dull to a bright red heat. At the end of every hour the inlet and outlet pipes are opened and the air renewed, the pipes being again closed. This process continues until the required thickness of oxide is formed, which will, of course, depend upon the purpose for which the articles are designed. The cost of thus protecting iron depends simply on the amount of fuel used, with the labor and wear and tear of apparatus involved; so that the process has, it is claimed, the advantage of being the cheapest as well as the most effective yet brought before the public. The coating has been severely tested, both as to hardness, homogeneity and capability of withstanding all the ordinary oxidizing influences likely to be brought to bear on it, and has not been found wanting. It is found that the process, as at present carried on, answers best with cast iron; but with a cheap and easily applied modification, the details of which are not yet made public, it is found to answer equally well for all other descriptions of the metal.

NOTES ON THE TELEPHONE.—The telephone has been successfully adopted, says the *Railroad Age*, by the Central Pacific railroad, as a means of communicating between stations over the mountain division. Boxes are to be placed a few miles apart and the track walkers are required to report by means of them on each round. For use at stations where business will not justify the employment of a telegraph operator there is no doubt that the telephone will prove a valuable adjunct, and we expect to hear of its common adoption. The *Detroit Free Press* gives an account of the working of the telephone during the recent burning out of its building. The telephone in the editorial rooms communicated with the residence of the managing editor, a mile and a half away. When the fire attacked the editorial rooms, the bell at the residence began to ring violently. As the fire increased in intensity the ringing of the bell became more impetuous, pealing in gusts as the fire seemed to surge around the companion bell in the burning building. It was an embodiment of Poe's lines on "The Bells," where the rising and the quelling of the fire could be calculated by the rising and the falling of the anger of the bells. At last the clamor of the telephone bell became unbearable to those in the room and the bell was muffled with cotton, which partly stopped the alarm. But here the strangest part of the telephone's action comes in. From the speaking tube came the roar of the fire, and it would seem that the swish of the water from the engine, and the pouring of the floods from the roof could be plainly heard. The crackling of the burning timbers, and at last the crash of floors and falling partitions came, and every sound of the conflagration in all its inflections was faithfully reproduced. The sudden stoppage of all sound showed that communication was broken and the voice of the wonderful instrument stilled by the scorching flames.

MANUFACTURE OF CHLORIDE OF LIME.—A new process for the expeditious manufacture of dry chloride of lime has been invented by Mr. E. Malet, of Paris, which consists in the employment of mechanical means for stirring, agitating, or mixing the powdered lime and the chloride of lime as fast as it is formed, in such a manner as to expose all the molecules of these substances in succession to the continuous action of the gaseous chlorine, which is introduced under favorable conditions for combining with the lime, and is rapidly absorbed by the latter. In order to insure regularity, it has been found necessary to couple at least two apparatus together, so as to admit of the chlorine being directed into either as required. The process is very rapid, and is carried out with great facility, and without any waste of chlorine. The progress of the operation may be constantly watched by persons near the apparatus, which emits no injurious odors. The apparatus is cheap in construction, and occupies but little

space. The manufacture may be regulated at will, as examples of absolute homogeneity (as may be ascertained by testing) may be taken at any time during the operation. As the chloride of lime manufactured in this manner is homogeneous in every part it is not liable to become decomposed, as is the case with chlorides manufactured in layers, more or less deep, and in a state of rest, and a source of considerable loss is thereby avoided in the manufacture of this product, which is liable to deterioration from the influence of climate and other influences resulting from its composition.

TESTING LUBRICATORS FOR ACIDS.—A new and simple method of testing grease and oil for acids is recommended by Dr. Weiderhold to those who use either grease or oil as lubricators for machinery. Either cuprous oxide or copper-smith's scale is put into a small test tube, which is filled with the oil to be examined. If the latter contains no fatty or resinous acids there is no change in its color, but if there is any the oil is colored, becoming light green in its lower portion within a short time, if the amount is small, the intensity of the color varying with the amount of the acid. Oil containing resinous acids is turned blue. These reactions appear within 10 to 20 minutes at an ordinary temperature. They are accelerated, however, by the application of heat. This method is far superior to most of those proposed, as it is very readily and easily employed. Dr. Weiderhold states that the action is so striking that it cannot be mistaken by any one, even though the experiment were made for the first time. The coloring of the oil is probably due to the fact that the fatty and resinous acids decompose the cuprous oxide, metallic copper and cupric oxide being formed. The latter enters into combination with the acids and produces salts which, dissolving in the oil, give it a green or greenish-blue color.

THE ENJOYMENT OF LABOR.—Ruskin never said a truer thing than this: "If you want knowledge you must toil for it; if food, you must toil for it; and if pleasure, you must toil for it." Toil is the law. Pleasure comes through toil, and not by self-indulgence and indolence. When one gets to love work his life is a happy one. Said a poor man in Brooklyn the other day, with a family of 11 to provide for, "If I were worth a million dollars I should not wish to do much different than I do now every day, working hour after hour. I love it a thousand times better than to rest." He has for nearly half a century been surrounded by workers and has caught the spirit of industry. He loves his work better than his food and sleep, often begrudging the time required by each. He is happy who has conquered laziness, once and forever!

GOOD HEALTH.

The Philosophy of Hot Bread.

A correspondent sends the *Journal of Chemistry* the following query: "Physicians often recommend for sick people oatmeal or graham pudding, made by stirring the meal into water and boiling a few minutes, as one of the first things to be eaten when the stomach will not bear hearty food. Why is the meal thus prepared any more easily digested than new bread or hot muffins, which are considered unhealthy? Is not the same chemical change necessary in the one as the other, which can only take place by standing for several hours after cooking?"

The two cases are by no means similar. The oatmeal or graham flour is made digestible by boiling, the starch granules being ruptured, so that their contents are more easily acted upon by the digestive fluids. In the making and baking of bread the same change is accomplished. The difference between hot new bread and that which is older is essentially the same as between "heavy" and "light" bread. It is its "lightness" or porosity which gives to bread its ready digestibility. When new, it is softer, from the steam of the water it contains; and this makes it difficult of mastication and liable to form a close and cloggy mass, which, on passing into the stomach, is less easily penetrated and acted upon by the gastric juice. By cooling and drying it becomes firmer and more friable, so that it is more thoroughly mixed with the saliva in the mouth, and goes into the stomach in better condition for the process to which it is to be subjected there.

If the bread is hot enough to melt the butter eaten with it, this makes the matter worse. The melted grease fills up the pores of the bread, and interferes with the action of the saliva and gastric juice. The fatty matters in pastry are objectionable for the same reason, and also on account of the chemical changes which they undergo in the oven.

Bread becomes more digestible by toasting, chiefly because it is made drier and firmer—that is, if the toasting is properly done. The slice should be rendered crisp throughout its entire thickness. If it be merely scorched on the surface, as often happens when the slices are thick and Biddy is stupid or in a hurry, the interior is merely softened and made like new bread, and consequently less digestible.

What English people call "bread jelly" is a light and nourishing article for weak stomachs, in some cases preferable to the oatmeal or wheat porridge. It is made by steeping stale bread in

boiling water, and passing it through a fine sieve while still hot. It may be eaten alone, or after being mixed and boiled with milk.

How to Sit.—*Hall's Journal* persists in robbing us of our comfort in this style: All consumptive people and all afflicted with spinal deformities sit habitually crooked, in one or more curves of the body. There was a time in all these when the body had its natural erectness, when there was the first departure on the road to death. The make of our chairs, especially that great barbarism, the unwieldy and disease-engendering rocking chair, favors these diseases, and undoubtedly, in some instances, leads to bodily habits which originate the ailments just named, to say nothing of piles, fistula and the like. The painful or sore feeling which many are troubled with incessantly for years, at the extremity of the backbone, is the result of sitting in such a position that it rests upon the seat of the chair, at a point several inches forward of the chair back. A physiological chair, one which shall promote the health and preserve the human form erect and manly, as our Maker made it, should have the back straight, at right angles with the seat, the seat itself not being over eight inches deep. A chair of this kind will do more towards correcting the lounging habits of our youth than multitudes of parental lectures, for then if they are seated at all they must sit erect, otherwise there is no seat-hold.

How to Eat Oatmeal.—Oatmeal, cracked wheat, and similar hoiled breakfast dishes often become more or less indigestible, says the *Journal of Chemistry*, from being "hoiled" in the usual Yankee style. They are soft and "go down" easily, and are shoveled or spooned into the stomach, with no delay in the mouth en route. They need mastication as really as beefsteak does—not to save one from choking (which many people seem to suppose is the sole reason for chewing), but to mix them thoroughly with saliva, which is a digestive agent and not a mere lubricant to expedite the passage of dry food down the esophagus. A friend of ours was lately complaining that oatmeal did not agree with him, and we found on inquiry that he was in the habit of eating it in this hurried way, without insalivation. He was much surprised when told that he ought to "chew" it, or at least to detain it for a moment in the mouth before swallowing it; but after a brief trial he admitted that he had no more trouble in digesting it. If the oatmeal or wheat is not thoroughly cooked it is all the more important that it should be masticated, as the half-softened grains offer considerable resistance to the digestive fluids.

DEATH RATES IN CITIES.—The *Sanitarian* for May furnishes some interesting statistics of the death rates in different cities of the Union during the month of March last. New York exhibits the largest ratio of any northern city, being 25.69 per 1,000 inhabitants. This, however, is far exceeded by Charleston, S. C., where the ratio is 32.89. As a rule, the southern cities show a larger death-rate than northern ones. In New Orleans it is 24.5; in Washington, 23.55; in Nashville, 22.21; in Mobile, 24.11. St. Louis, however, shows one of the lowest rates in the table, viz., 9.39, while that of Baltimore is only 18.26. Of northern cities, Boston has a death-rate of 20.38, New Haven, 18.44; Syracuse, 18.25; Brooklyn, 18.19; Providence, 18.06; and San Francisco, 17.25; while many others are considerably below even these figures. The lowest rate in the list is that of Yonkers, in New York, where the mortality for the month was only 8.27 per 1,000.

KEEP THE HEAD COOL.—An interesting paper was read at a recent meeting of the Royal Society on "Experimental Researches on the Temperature of the Head," in which the writer, Dr. Lombard, showed that mental activity will at once raise the temperature of the head, and that merely to excite the attention has the same effect in a less degree. This is a curious result, as appearing to show that anything of the nature of volition involves a waste of nerve tissue which is not involved in involuntary perception and observation. There is no difference, we believe, between the temperature of the sleeping body and that of the waking body, or between that of the waking body and of the head, so long as no act of effort is involved. But if even the least intellectual effort raises the temperature of the head above that which it reaches in amused and idle observation, it would seem to show that there is a waste involved in volition which belongs to no so-called "automatic" action of the mind. And that is itself a fact of no slight significance.

MRS. PARTINGTON ON DISEASES.—Diseases are very various—very. The doctor tells me that poor old Mrs. Hazo has got two huckles upon her lungs! It's dreadful to think of 'tis really. The diseases is so various! One day we hear of people's dying of "hermitage of the lungs," another of "brown-creatures;" here they tell us of the "elementary canal" being out of order and there about the "tear of the throat;" here we hear of the "newrology in the head" and there of an "embargo" in the back. On one side of us we hear of a man getting killed by getting a piece of beef in his "sarcofagus," and there another kills himself by "desilvering his jocular vein." Things change so that I don't know how to subscribe for any thing now-a-days. New names and "rostrums" take the place of the old and I might as well throw my old yerb hag away.

The Week.

The weather the past week has been propitious to all our leading industries. The outlook for the mines, which continue to yield bountifully, is exceptionally good. An increasing demand for labor has tended to further meliorate the working masses and placate the malcontents; never here of the communistic or other more dangerous kind. Commencement at the State University passed off on Wednesday last in a manner creditable to the faculty and graduating class, and gratifying to the friends and patrons of the institution. The provisions of the proposed new Constitution are being discussed with a freedom and breadth indicative of radical changes in the present instrument. The first step towards settling the great problems of irrigation, tule land reclamation and the disposition of the mining debris, was taken during the week, the State Engineer having entered upon this work, for which the Legislature, at its last session, appropriated the sum of \$100,000. Salmon fishing, retarded by the lateness of the run, is now active and the canneries are likely to do a good business before the season closes.

It is believed that Chicago can save \$200,000 per annum over the present cost of gas by lighting the city with electric lights, and the proposition is now being thoughtfully considered by the business men of that city.

PROF. MARTIN and C. A. Mahoney, an *Alta* reporter, who made a balloon ascent from Woodward's Gardens, last Sunday, were badly bruised while trying to land, owing to the violence of the wind.

THE result of a test case, tried at Philadelphia, foreshadows that Allegheny county must pay for all the goods destroyed in the Pittsburgh labor riots.

Moving the Mining Debris in the Slate Creek Basin.

From what is being said by our mountain contemporaries on the subject, we infer that increased attention is being paid to the reworking of the hydraulic tailings which have been deposited in great quantities along the beds of some of the interior gulches and rivers. We have heretofore described at some length the character of these deposits, as we find them at several places in Placer and Nevada counties, making mention of the efforts about to be made there to utilize the same. At a number of points in the mining districts further north this auriferous debris has made extensive lodgment; notably so along Slate creek, Sierra county, where also a grand project has been inaugurated for moving and reworking these accumulations. Skirting this creek, which runs through a broad basin-like valley, are several of the old channels known as Pliocene or "Dead Rivers," being gold-bearing streams that in a former age have been so filled up with alluvial drift, volcanic ash and lava flows that nearly all surface indications of their existence have been obliterated. Slate creek, which at times is quite a large stream, takes its rise in the deep canyons and spurs about Pilot peak, Plumas county, and running southwest discharges into the North Fork of the Yuba, receiving in its course the detritus from Whiskey Diggings, Gibsonville, Gardner's Point, Howland Flat, St. Louis, Pine Grove and several other important hydraulic camps situated along the main stream or its confluent. Gold washing commenced in the Slate Creek basin at an early day and has been steadily and successfully pursued there ever since, the mines here having paid as well as in any other part of the State. Their production has, in fact, been notably large, the quantity of gold dust annually sent from La Porte, shipping point for this section of country, having formerly been estimated by the ton. About the richness of the original stock of gravel in this neighborhood there can, indeed, be no question; it being equally well known that a large percentage of the gold still remains in the tailings, the more valuable portions of which, being too heavy to be easily floated away, have lodged along the bed of the stream, filling the upper section thereof to a great depth.

At a point on Slate creek about one-fourth of a mile below the mouth of Rahbit creek, one of its tributaries, there occurs a considerable fall, caused by a heavy reef of hard rock crossing its bed. By cutting away this rock for a short distance an open channel would be secured having sufficient descent to run off the entire body of tailings deposited along the stream above. Once past this barrier these tailings would not again make lodgment, the fall in Slate creek below being ample to carry them on and empty them into the Yuba.

The quantity of this debris now resting in the bed of Slate creek can be estimated from the fact that it has filled up the channel to an average depth of 40 feet and a width varying from 150 to 800 feet for a linear distance of 15 miles, this being apart from the large quantities deposited in the numerous branches of the main stream. Of this material the Alturas company, owning the principal outlet and already organized for active operations, have title to 3½ miles, covering an area of 320 acres of the heaviest and richest of these deposits, besides 600 feet extending up Spanish Flat ravine. This company also own two ditches, have a sawmill for cutting all needed lumber, and a franchise for the water flowing in Slate creek. They have done much work upon this property in the way of cutting down bedrock, tunneling through rocky points to increase the fall by shortening the channel, in the hope that they would by these means be able to move the mass of gravel and continue washing, without incurring the greater expense of excavating a passage through the rocky barrier that constitutes what is known as the falls.

Having, through recourse to these cheaper expedients been unable to prosecute operations on a large and uninterrupted scale, this company have determined to adopt the more effectual plan of cutting through the reef near the lower end of their claim and thereby secure ample grade to run off the gravel from their own track and the entire basin above. As this work is not at all formidable, either as regards the length of time or the amount of money required for its execution, the company ought to be able to readily command all the pecuniary aid needed and push it to an early completion. This scheme constitutes the third or fourth of a similar kind lately set on foot in the State, and all of which if properly managed ought to lead to good financial results. Of the others, one to operate on Shirlair canyon and two along Bear river and its branches, we have made some mention during the past few months, taking occasion then to state that, while these tailing deposits are very extensive in certain parts of our California gold fields, only in a few instances, like those here alluded to, do they exist under conditions favorable to their being hauled with profit, the great trouble being want of sufficient fall or outlet to move them economically and effectively. Where this can be had without too great cost the reworking of these auriferous slums opens a very alluring though limited field for the investment of capital.

Air Compression Tunnel and Mining Tube.

Among the topics of interest at the present time spoken of in the city in mining coteries is the issuance by Mr. H. R. Leonard, the mining engineer and architect, of a statement respecting his invention of a *modus operandi* for effectively reaching the bedrock of rivers and tunneling with safety beneath the waters. Old miners well remember the success that rewarded the efforts of many enterprising men who sought the golden ore over 20 years ago in the beds of several of the chief rivers of the State, and how not a few got suddenly wealthy in a day. Difficulties, however, then insurmountable, and so frequently met with, brought in their train so much of discouragement that river mining, in course of time, became almost entirely abandoned. Now and again new efforts were made by men of energy, means and good pluck to succeed in rendering bedrock mining a tangible and reliable enterprise of the country; but as far as we have ever heard no one has been fully satisfied with the results financially. Now we hope that something has at length been thought of which will meet the requirements of this class of labor, and thereby lead to the "better times" which once made California the envy of the world.

Mr. Leonard's brochure is clearly written, avoids puzzling technicalities, and is just such a statement as the least learned miner, as well as the wealthy capitalist, can readily understand. We regret being unable to give it as much space in our columns as would be of interest, but some of it we quote for the benefit of our readers who may be unable to obtain the entire pamphlet:

"It is not the wish of the inventor to convey the idea that the bedrocks of all the rivers in California are covered with gold in as great abundance as is here quoted of portions of bedrock that have been worked on the Yuba; he simply wishes to state that in numerous cases within his own knowledge, and in very many cases of which he has learned from the experience of others, large quantities of gold have been gathered from the bottoms of our rivers, and he now provides a means for protecting the miner and enabling him to obtain all the gold that is on the bedrock where he works. It is believed, however, by the inventor, that his air compression tunnel and mining tube will afford the means of practically solving this great problem, and that tunneling under the bed of a river will be made comparatively easy and entirely safe.

"A general description of the apparatus and its application to tunneling under water may be thus stated: A tube is made of iron, of suitable diameter, in sections of convenient lengths, and bolted together and made air and water tight. This tube is driven through the sand and gravel to the bedrock by pneumatic force. Where its sinking is retarded by rocks, these can easily be removed by blasting in the ordinary way of sinking shafts. The tube, when completed, is supplied with proper air locks at the top and bottom. Those at the bottom of the tube are four in number, each of three chambers, and each of these provided with doors for ingress and egress as required. As many as 40 men can be worked on one claim with perfect freedom of action. The tunneling over the bedrock is performed like ordinary tunneling, and the water entering the tunnel from seepage or otherwise is driven out by atmospheric pressure by air compressors, operated by steam power, and is kept out by the same atmospheric pressure, under which the miners work. All proper appliances are provided for hoisting by steam in the usual way. The tube and chambers are well provided with safety valves, gates, etc., so that the workmen can, at their own convenience, protect themselves from over-pressure of air.

"The great advantages claimed by this means of operation are, that the miners are able to tunnel over the bedrock and pick and scrape up the whole surface, and can see the work before them and save all the gold within the claim. By the use of this apparatus the miner can work all the year round—being in no way affected by the high water."

So fully confident is Mr. Leonard of the successful operation of his invention that he announces himself ready to put up his machinery on any claim and wait for his compensation till it is a demonstrated success. He adds to his own statement a handsome endorsement by B. S. Alexander, Col. U. S. Engineers and Brevet Major General U. S. Army stationed on the Pacific, and from what we hear, the inventor has enough of friends around him to incorporate, whenever he is ready, a "mining tube and air compression tunnel company," and to manufacture to any extent the entire apparatus.

THE HOE CHISEL TOOTH SAW.—We have been shown letters from sawyers and owners of various mills, which leave no doubt that the improvements in the Hoe chisel tooth saw, made under the supervision of H. L. Tatum & Co., agents in this city, are considered a decided success. Messrs. Hanson, Ackerson & Co. have recently ordered 32 of these saws, ranging from 1½ to 60 inches in diameter, for their Tacoma, Washington Territory, mill.

In three days a man panned out of the black sand on the Santa Cruz beach, \$23 in gold. JOURNAL

Notices of Recent Patents.

Among the Patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

SELF-TAPPING CAN FUNNEL.—A. W. P. Ladd, S. F. This device, which the inventor calls a self-tapping can funnel, consists in the employment of a tapering or conical receiving vessel, having a suitable discharge pipe or nozzle, and provided with a cutter or piercing device so that a can may be placed upon it and its contents discharged into the funnel. It is simply a sort of shallow dish, made somewhat funnel-shaped, having a sort of nozzle of suitable size or shape to enter a receiving can. This funnel-shaped dish is set on top of the receiving can, and has a vertical cutter or knife projecting up from it. When it is desired to pour a can of coal oil for instance into the receiving can, the can of oil is set down on the dish, when the cutter pierces it and the contents run into the dish and thence into the receiving can. The device is useful for tapping and emptying any cans that contain coal oil, turpentine, alcohol, or other fluids that will flow through a funnel.

GATE.—A. G. Rockfellow, Ashland, Oregon. The patent covers an improved gate, which can be used either as a house-yard gate, to be opened and closed by hand, or as a farm-gate, to be opened and closed by cords leading to and over pulleys at a distance from the gate. The object of the invention is to provide a gate with adjustable bearings, hangings and fastenings, which can be quickly and easily adjusted to the varying conditions of the gate in wet and dry weather, so as to always preserve its freedom of motion and operation. The bearings and fastenings are strong and substantial and at the same time ornamental, so that the gate presents a handsome appearance and is convenient to operate.

BOILER COVERING.—Gilbert C. Fowler, S. F. The improvements relate to the manufacture of such plaster material as is used for surrounding steam boilers, steam pipes and other heat-radiating surfaces with a non-conducting coating or covering in order to arrest waste of heat. Mr. Fowler adds some new ingredients to those commonly in use for the purpose of preventing the cracking caused by alternate expansion and contraction of the material. The new pulp is also a good non-conductor and mixes well with other substances so as to form a homogeneous mass which forms a durable non-conducting shell or case.

AMALGAMATOR.—J. H. Hohart and Chas. W. Stuard, Oakland. This invention is an improvement in that class of amalgamators in which the pulverized ore, black sand, tailings or other material containing valuable metals, is carried into and beneath a body of mercury. It consists in the employment of a series of chambers containing mercury, into which the feed and connecting pipes dip and through which the sand is forced by gravitation, suitable distributors being employed. Between each pair of the series are placed sluices containing riffles, the whole terminating in a tailings or settling-box.

DERRICK.—J. D. Winters, Grand Island. This invention relates to certain improvements in wagon derricks, and consists in a novel method of attaching the foot of the derrick to the wagon, in combination with a device for raising the derrick from a horizontal to a vertical position upon the wagon. The arrangement is such that the derrick can be carried conveniently on the wagon and raised quickly and easily to a vertical position when desired.

UNLOADING NET.—J. D. Winters, Grand Island, Colusa county. This patent covers an arrangement for connecting and disconnecting the two parts of a netting, such as is used for unloading header wagons. The arrangement is extremely simple and strong, and the disconnecting apparatus obviates the necessity of using a spring or other device of doubtful strength and action.

CROWN POINT.—The annual election of the Crown Point mining company was held on Monday last. The report of the Secretary for the present year shows receipts amounting to \$575,391.35, of which \$369,101.53 came from assessments and \$133,500.76 from bullion. The present liabilities are \$49,445.02, of which \$42,461.35 is overdrawn at the Bank of California. During the past year the expenses of the mine were reduced \$372,863. The Superintendent's report is an exhaustive review of work accomplished, and holds forth the hope that at great depths a body of pay ore will be developed. The following Board of Trustees was elected: J. P. Jackson, J. D. Fry, C. L. Weller, J. H. Robinson and A. K. P. Harmon. The stockholders' meeting then adjourned. At a subsequent meeting of the Trustees C. L. Weller was elected President; A. K. P. Harmon, Vice-President; James Newlands, Secretary and S. L. Jones, Superintendent.

The South Pacific Coast Railroad.

There is no one agent which has done as much to render possible the rapid development of the western regions of the United States as the railroad. Not only has it developed the physical resources of the minor regions, but by bringing into intimate personal acquaintance people from the remote parts of our immense country, it has done much to do away with sectional prejudice, and that whole class of serious misunderstandings which have already proven so dangerous to the existence of our government.

It is, therefore, with no little pleasure that we record each new move forward in this direction. Of late the narrow-gauge system has done much to make possible the extension of railroad facilities to new and undeveloped regions like those of the larger part of the Pacific Coast. We regard these narrow-gauge roads of the very greatest importance to our sparsely settled mining, timber and agricultural districts, and for this reason devote some little space to the newest example in that direction, the Bay and South Pacific Coast Railroad.

This road is projected to run from San Francisco to Santa Cruz, and its route is shown in the accompanying map. The upper end of the road as far as Newark is called the Bay and Coast Railroad, the remainder of the road the South Pacific Coast Railroad, though the officers of the two companies are at present identical and the roads are practically one and the same. From San Francisco the start is to be made on one of the two fine double-ended ferry boats, *Newark* and the *Bay City*, which were built for the company. These vessels are to run to

The Northern Terminus of the Road.

At the mouth of San Antonio creek. Here, owing to the recent improvements of the Oakland Harbor Commissioners, there is an opportunity for a fine landing. A large wharf has been built, 800x220. An engine-house and turn table have been built, and sheds are soon to go up. An artesian well 275 feet deep has been sunk and yields a good supply of fine water. The wharf is firmly and solidly built, the piles being run through 30 feet of tough mud and then through two or three feet more of good hard sand. There is 10 feet of water at present at the wharf at low tide, and four dredgers are at work clearing out the bottom to the depth of 15 feet. An interesting little feature of the engineering is the utilization of the mud from the dredging for embankment. Usually this is removed by towing the mud scows out to deep water and discharging it, where it at least does no good, if it does not occasion positive harm. The mud here is a very tough blue clay and the engineer in charge, Mr. W. P. Drumm, has built a railroad wharf 1,100 feet out to deep water, and has had the mud discharged from the dredger into the flat cars on which it is hauled to the place where it is needed on the road. It dries out rapidly and makes a very solid embankment.

From the creek landing the road runs across the marsh to the end of Alameda point around the residence of Gov. Haight, then down through the town of Alameda, and then along the coast through numerous small stations to

The Future Town of Newark.

This town site is very similar to that of Oakland, is almost perfectly level and will no doubt in time be a business center for the surrounding fertile country. At present there are built a round house, offices, etc., and the car shops, where are built all the cars used on the road. Mr. Martin Carter has charge of this work, he employs from 30 to 40 men in putting up these cars which are built from the wheels up. The iron work, with the exception of the wheels, which come from the East, is all done in San Francisco. The locomotives are built at Baldwin's, Philadelphia.

The Rolling Stock

At present consists of 100 platform cars, 10 box cars, 9 hand-cars, 4 baggage cars, 14 passenger cars, 8 locomotives, and is being constantly increased.

From Newark the road runs across the great marsh which forms the head of the Bay of San Francisco, and so reaches Santa Clara. The greater part of the road up to this point is not

of any special interest from an engineering standpoint, as it runs along a perfectly level country. But it is very solidly built, even across the extensive marshes. It is ballasted very thoroughly with gravel from Los Gatos creek. The country through which it runs is apparently of the most fertile kind, the grain was almost everywhere on a level with the tops of the fences, and along the track the wild mustard grew frequently over the tops of the cars. The road thus reaches

San Jose.

Where a neat and commodious station is built. Thence it runs about nine miles up a gentle incline to the foothills along Los Gatos creek to the pretty little town of

Los Gatos.

This is at present the end of the road, stages

grade of on an average 70 feet to the mile has been secured from Los Gatos to the summit of the road in tunnel No. 3. From Los Gatos the road runs along the creek for one and one quarter miles. Here it crosses the creek by a combination Howe truss of 87 feet span. Then follows half a mile of the most difficult work on the road. The track runs along the face of a high, shingly bank. In running the preliminary survey the men had to be lowered by ropes in order to establish their points, and of course on such a steep incline the cut and fill are both extremely difficult. The town of Lexington is familiar to all travelers on the old Santa Cruz road as one of the stage stations. It contains a hotel, a stable and a blacksmith shop. The next mile and a half is on a fair level piece of ground with no special difficulties in the

the road has not been definitely located, though preliminaries have been run. The road will, however, take in Felton on its way to Santa Cruz. It will probably run down Bean creek for one and one-half miles from tunnel No. 4 to the spur which will necessitate tunnel No. 5, of about 1,200 feet, and then to Felton at the junction of Zyante creek and San Lorenzo river.

Felton

Is a small town, which is at present the terminus of the Santa Cruz and Felton railroad. It is the center of the great lime industry and the terminus of several lumber flumes.

The Tunnels

Of this road are so extensive that some special mention of them is necessary. We will take them up in their order and recapitulate: Tunnel

No. 1, caved in, now an open cut; tunnel No. 2, 190 feet; tunnel No. 3, 6,155 feet; tunnel No. 4, 5,800 feet; tunnel No. 5, 1,200 feet, probably. The ground in which they are built seems, as far as yet opened, to be of nearly the same nature, a dark, clay slate, firm when first opened, but swelling on being exposed to the air and necessitating very solid timbering.

The tunnel is arched at the top and its sides incline slightly from the spring of the arch to the floor. The distance from the crown to the floor is 16 feet three inches. The span of the arch is 13 feet. The width of the floor is 11 feet four inches. The timber is all 10 by 12-inch stuff. The arch is made in six pieces. Each is three feet 10 inches on the top and three feet four inches on the bottom. A flat rod of iron runs through each of these joints, connecting each set of timbers firmly with the adjacent ones. Behind the timbers, four by four-inch lagging is placed all around throughout almost the entire length of the tunnel. This is necessitated by the shifting nature of the ground. The tunnel is quite dry and the air of the tunnel No. 3 is strongly impregnated with petroleum and at one time the whole face of the tunnel ignited and flamed up for several seconds. Large numbers of fossil shells have been found in those excavations. They very much resemble the clam and periwinkle shells found at present on our beaches. They have been pronounced by Mr. R. E. C. Stearns, as belonging to the tertiary period. Tunnel No. 3 is at present in 600 feet at the north or Santa Clara end. The south or Santa Cruz end is giving much trouble, as the ground is full of water and very uncertain. A small drift, six by six feet, has been put in about 160 feet, and it is the intention to widen this out to the full size as soon as firm ground is reached. The faces of tunnel No. 4 only have been opened and the rest of the tunnel work is all in the future. It is expected that it will take at least a year to complete these tunnels, and that by the time they are down the rest of the road will be built and the connections only will have to be made.

The highest point on the road is the center of tunnel No. 3, which is 803 feet above the sea level and 690 feet below the crest of the range at that point. The tunnel beds falls three feet in 100 each way from the center. The maximum grade on the road is 90 feet to the mile. The average grade from Los Gatos to tunnel No. 3 is 70 feet to the mile. The maximum of curvature is a 16° curve.

There are several engineering features which we hope to speak of more fully in the future, when the mountain work is more fully developed.

From what we have seen of the road, we predict for it a promising future. The beauty of its mountain scenery will certainly render it one of the most popular roads in the State, and we think it will secure all the passenger traffic to Santa Cruz, as well as do much to develop the industrial resources of this region.

The officers of the company are as follows: A. E. Davis, President and Treasurer; B. B. Minor, Secretary; Thomas Carter, Superintendent; G. H. Waggoner, General Passenger Agent.

A fire at Weaverville, Trinity county, last week, which commenced in Chinatown, owing to the carelessness of Mongolians, destroyed 15 houses and caused a loss of \$6,000.

CONSIDERABLE interest is being manifested in the approaching election.

MAP SHOWING THE ROUTE OF THE SOUTH PACIFIC COAST RAILROAD.

making connection here with Santa Cruz. The track is laid and ballasted to this point, and a through train leaves here at present at 6:30 A. M. daily, the trip to Alameda being made in two hours and a half. Returning it arrives at 7:30 P. M. Los Gatos is said to produce the best flour in the State. It is the center of supplies for that part of the country. It contains a couple of hotels. The one near the railroad has recently changed hands, and under the management of Mr. Eddy promises to be a pleasant stopping place. The mountain work proper begins at Los Gatos, and several lines were run before the present and most feasible one was adopted. This piece of engineering is being carried on under the direction of Mr. E. H. Mix, to whose kindness we are indebted for many of our facts. The road finally selected continues up Los Gatos canyon until at its head it pierces the mountains in several quite extensive tunnels. These tunnels are of course expensive, but by this means a very moderate

way. It is proposed to establish in this little valley a station for that part of the country. Here comes the second crossing. From this point the work becomes more or less difficult from the rough and irregular ground which makes cutting and filling both quite heavy. The road crosses the creek six times before reaching tunnel No. 3, at a distance of seven and a half miles from Los Gatos. Tunnel No. 3 is where the road pierces the main ridge, and is just at the county line, one end opening into Santa Clara county, the other into Santa Cruz. The center of this tunnel is the highest point on the road. It is to be 6,155 feet long, and will be spoken of more in detail later. The road then runs for 4,500 feet through a steep canyon, heavily wooded. This part of the road may be described as extremely picturesque and expensive. Then comes tunnel No. 4. This runs for 5,800 feet through a spur which it was decided to pierce for the purpose of opening up the fertile region beyond. Beyond this point

[From a previous issue of the Press.]

An Improved Fileholder.

An article which is valuable mainly for its usefulness, if simplified without being made less effective, is improved. The fileholder illustrated herewith is an invention of this sort. Like the short horse soon curried, its operation is briefly described. Its merits, however, are not so quickly noted in words as observed by sight.

To file newspapers, or other printed matter, the round rubber band slipped over the inclined end of the upper bar into the notched end of the lower bar. With the lower bar resting on a table, the upper bar is swung vertically or sideways, leaving the points for receiving the papers entirely unobstructed. The hinged ends of the bars, being rounded and held elastically, the upper bar is easily and naturally brought back to the right position, where it is quickly fastened by slipping the adjustable band over the incline.

Among the advantages gained by this holder are the following:

It can be opened and closed quicker than others.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or a small number of papers.

Devoid of all surplus material, it approaches nearer to bookbinding than other fileholders. With less material, it is lighter and less cumbersome than other holders.

It has no protruding ends to tickle the reader's ribs; no sharp corners or metal parts for defacing furniture.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. Consisting of so few parts, the two strong rubber rings are the only portions possible to wear out. These can be replaced at trifling cost. The file is adjusted but 52 times a year for a weekly paper. A sample holder can be opened and closed 1,000 times without showing depreciation.

Having, as a publisher, considerable use for fileholders, the inventor could find none of the hundred different kinds patented or in use devoid of decidedly objectionable features. For this reason he adopted and used some of the simplest forms conceivable. After several years' use and repeated improvements, the device we illustrate has proved the best.

The patent was allowed in April, 1876, since which time many holders have been used, giving full satisfaction. About 100 have had constant handling in the Free Reading-Room, Oakland, Cal., rendering full measure of satisfaction.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.

From our own experience and the testimony of others, we do not hesitate to recommend this simple article as the best of its kind.

Samples will be mailed from this office for 50 cents, post-paid.

Orders will be received by the S. F. News Co. The price list will also be furnished by same company on application.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send out no hut worthy men.

MR. W. J. WOODLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Patent Solicitors.

No. 202 Sansome St., S. F.

**Designing
and
Engraving
at
This Office.**

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.**TO QUERISTS.**

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and subscribers against the acts and mistakes of others.

PACIFIC RURAL PRESS,

A first-class 16-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 130 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 130 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

Much Obligated, Etc.

PORTLAND, OREGON, June 20th, 1877.

DEWEY & Co., Patent Solicitors, S. F.—Gents: I am much obliged to you for courtesy shown me, and am much pleased with the manner in which you have done my business, and assure you, will cheerfully recommend you to my acquaintance needing such services. Hope to have a case again before long, of my own. I have been an inventor all my life, but let others reap the benefit, or had work taken from me. Please have the extra copies of my patent, etc., mailed to me direct, and oblige.

Yours truly, J. H. WOODRUM.

APPRECIATION ABROAD.—We copy the following from the *Mining and Metallurgical Gazette*, of London, England: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the 'United States Mining Laws and Instructions, by the Commissioner of General Land Office, taken from our talented contemporary, THE MINING AND SCIENTIFIC PRESS, of San Francisco. The documents have now been issued in a handsomely bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

PROMPT AND SUCCESSFUL.—Messrs. Dewey & Co.—Gentlemen: Your Circular letter, 12th inst., informing me of successful termination of my application for patent received. Please accept thanks for the prompt and successful manner in which you have managed this business. Yours respectfully, J. H. CAVANAUGH.

Walla Walla, Dec. 24th.

Certificate of Partnership.

The undersigned having, January 1st, 1878, formed a partnership to carry on the business of general machinists and engineers in constructing and repairing machinery under the firm name and style of Birch, Argall & Co., this certifies that the principal place of business of said partnership is situated at 119 Beale street, in the city of San Francisco, State of California, and that William H. Birch and John Argall, each residing in said city, are all the members of such partnership.

Wm. H. BIRCH. [Seal.]
JOHN ARGALL. [Seal.]STATE OF CALIFORNIA,
CITY AND COUNTY OF SAN FRANCISCO, } ss.

On the twenty-fourth day of May, A. D., one thousand eight hundred and seventy-eight, before me, J. Robert Read, a notary public in and for said city and county, residing therein, duly commissioned and sworn, personally appeared William H. Birch and John Argall, known to me to be the persons described in whose names are subscribed to, and who executed the annexed instrument, and they acknowledged to me that they executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal, at my office, in the city and county of San Francisco, the day and year last above written.

J. ROBERT READ, Notary Public.

(BETWEEN BROADWAY AND WASHINGTON.)

OAKLAND, CAL.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. E. Redding, appears complete in the *Pacific Rural Press* for January 20th, and also the *MINING AND SCIENTIFIC PRESS*. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the *Press* as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

Steel Castings,

Solid and Homogeneous. An invaluable substitute for expensive forgings, or for Cast Iron requiring great strength. Send for circular and price-list to

CHESTER STEEL CASTINGS CO.,

EVELINA STREET, - - - PHILADELPHIA, PA.

STEAM ENGINES AND BOILERS.

One new Straw-burning Portable Engine, made by Ransome, Sims & Head, Ipswich, England. This is a very superior engine, sent here as a sample engine for exhibition; one second-hand Straw-burning Engine, 8x10 inch cylinder, (Rice); one second-hand Wood-burning Engine, 8x12 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 7x10 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 5x10 inch cylinder, (Hoadley); one second-hand Wood-burning Engine, 6x12 inch cylinder, side engine; one new Stationary Engine, independent cut-off, 12x24 inch cylinder. [The Straw-burning Engines named are free from infringements.]

One large sized Rock Breaker, Varney & Rix, size 9x15; one Wood Splitting Machine; one 36-inch cylinder Russel Separator, (with extra cylinder, and Lauffenberg shoe - very cheap, on account of owner's death; (will be sold with or without any of above engines.) All of the above second-hand engines have been in shop and overhauled, and are in good working order. Various other machinery for sale. Purchase made on Commission. Machinery repairs solicited. Specialty of Portable Engines and Boilers for threshing.

J. W. RILEY, (Box 2361) San Francisco.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 83 to 85 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day.....3 00
Wood, 1 1/2 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
Cost of one ton.....67 1/2
From 2 1/2 to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:
JAMES W. WEBSTER, Paymaster Mine, Reno, Nev.
LEWIS CHALMERS, Manager Eschequer and IXL Mines, Silver Mountain, Cal.

J. S. COXE, Vice-President Tehama County Bank, Red Bluff, Cal.
R. H. CAMPBELL, Superintendent Afterthought Mine, Redding, Shasta County, Cal.

For further information, apply to

D. J. O'HARRA, Reno, Nevada.

FOR SALE.

One Engine, 14 by 30 Inches, Link Motion.
One Engine, 12 by 24 Inches.
One Engine, 9 by 18 Inches.

Boilers to match each Engine. Each of the above will be sold at a very low figure.

ROBERT M. CONE, 226 Fremont St., S. F.

Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

Engraving.

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates. Send stamp for our circular and samples.

THE BERKELEY GYMNASIUM,

(A Preparatory School to the University.)

A First-Class Boarding School,

Established in the interests of higher education, and in opposition to the cramming system of small colleges and military academies of the State. The next

Term Will Commence July Twenty-Fourth

EXAMINATION OF CANDIDATES FOR ADMISSION,

July Twenty-Second and Twenty-Third.

By request, instructions have been provided during the summer months for students preparing for the August examinations at the University. For catalogues or particulars, address

JOHN F. BURRIS,

Berkeley, Cal.

NOTE.—We desire to call special attention to the organization of our Grammar Department, separate from the Academic, and solicit the patronage of parents and guardians of small boys

GREAT ENTERPRISE!

—THE—

Sierra Flume & Lumber Co.

Have over 100,000 Acres of

SUGAR PINE, YELLOW PINE, SPRUCE

Fir and Cedar Lands,

10 Saw Mills, 3 Planing Mills, 1 Sash and Door Factory,

149 Miles V Flumes,
10 Miles Tramway,
157 Miles Telegraph Line,
13 Telegraph Stations,

Employ 475 Men and 550 Oxen & Horses.

The Sugar Pine is unsurpassed in quality, and the whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to any other hard Pine for Flooring, Stepping, etc.

The Spruce has great strength, durable when exposed, and especially adapted to Bridge and Ship Building, while the Fir and Cedar are as valuable for a great variety of purposes.

Last year thirty millions of feet were cut and the estimate for 1877 is fifty millions; fifteen millions are now on hand, thoroughly seasoned by the hot climate of Red Bluff and Chico.

Large orders can be filled on a days' notice for all kinds of

BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial work may be accomplished without delay at the usual cost for green lumber.

Orders for the interior filled at less than San Francisco prices and freights.

DOORS, SASH and BLINDS always on hand in large quantities. Address

SIERRA FLUME AND LUMBER CO.

PRINCIPAL OFFICES:

Red Bluff; Chico; San Francisco—corner Fourth and Channel Sts.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 25th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

PALACE THESE LARGE, FINE, NEW DINING ROOMS are exceedingly popular. The best of everything on the tables. RESTAURANT, Dinner furnished at the low price of NO. 218 SANSOME ST., S. F. FIFTY CENTS, from five to eight P. M. Visitors to S. F. should try the Palace.

R. HOE & CO.'S

CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with

Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, and now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Files are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

H. L. TATUM & Co., Sole Agents,
No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CURS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or slop, and at a mere nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAME MAKE.

Ice at \$1.00 Per Ton.

PICTET ARTIFICIAL ICE

COMPANY, (Limited).

Room 51, Coal and Iron Exchange.

P. O. Box 3083, New York.

The "San Francisco Law Journal."

Published weekly, in 8vo size—like the California Reports—contains all the decisions of the California Supreme Court, soon as rendered, with syllabus and statements of facts; and also, important decisions of other courts of last resort. Two volumes each year, commencing September first and March first, with full index, so it can be nicely and cheaply bound.

Price, only \$6.50 per year, or \$3.50 for six months, strictly in advance. We print a "Legal Directory" on the Journal cover of lawyers' address cards, kept corrected for the year, for \$3, or six months, \$2 in advance. Journal and card both one year in advance, \$9. Six months, both, \$5. Remit by postal order or registered letter, specifying what date or number to begin. Back numbers furnished. Single numbers 25 cents each. Legal briefs and transcripts our specialty. Address

BAGGETT, SCOFIELD & CO.,
Washington St., Cor. Montgomery St., S. F.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING MAY 21ST.

OSCILLATING WATER METERS.—Alvah C. Austin, Oakland, Cal.
 ORE WASHERS.—Charles O. Bagley, Oakland, Cal.
 PAPER REINFORCERS.—Julius Blumel, S. F.
 NEWSPAPER WRAPPING AND PARTING MACHINES.—Pleasant A. Chaffant, Independence, Cal.
 BOILER COVERING COMPOUNDS.—Gilbert C. Fowler, S. F.
 AMALGAMATORS.—John W. Hobart and Chas. W. Stuard, Oakland, Cal.
 SELF-TAPPING CAN FUNNELS.—Arnold W. P. Ladd, S. F.
 MEDICAL COMPOUNDS.—Charles C. Wainwright, Bishop Creek, Cal.
 WAGON DERRICKS.—John D. Winters, Grand Island, Cal.
 NETTINGS FOR UNLOADING WAGONS.—John D. Winters, Grand Island, Cal.
 WATER-GATE OR STOP-VALVE.—Alvah C. Austin, Oakland, Cal.
 WASTE TRAPS.—David Healey, Los Angeles, Cal.
 TRACK CLEARERS.—George Royal, Truckee, Cal.

TRADE-MARKS.

MEDICINAL PREPARATION.—Chas. R. Burrage, S. F.
 REMEDIES FOR COUGHS, COLDS, ETC.—Alice C. Simpson, Danville, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Encourage Your Home Paper.

Now that spring is fully open and mines are in full blast in all directions, the miners, who are beginning to harvest, should remember the PRESS, which is at all times laboring in their interest. Those whose subscriptions have run out should renew them without solicitation on our part, and should induce others to take the paper. The MINING AND SCIENTIFIC PRESS has labored diligently and steadily in upholding the mining interests of this coast for many years, and has devoted a large proportion of its space to the subject. To the mining community, therefore, we mainly look for encouragement and support. Miners should do all they can to foster and assist their home journal, and not only assist it pecuniarily but with practical suggestions and hints. We are always glad to receive letters from practical miners and mechanics on topics with which they are familiar. Such things are of value to others in the same business, and we will be pleased to disseminate such information as far as we can.

The amount it costs to subscribe for the PRESS for one year is insignificant compared with the benefits derived, since a stray hint or suggestion in its columns often saves hundreds of dollars and days of time. We glean information of all kinds from every source for the benefit of our readers, and nothing of interest or importance escapes notice. By this means we keep our readers posted on all that occurs in the mining or mechanical world at a slight expense to themselves. Those who are familiar with the merits of the journal should bring it to the attention of others, and thus assist us in a material way by enlarging our circle of readers and increasing the subscription list.

EL DORADO COUNTY FAIR.—We hear that the prospects are fine for an excellent fair at Placerville this year. The date is September 13th to 15th. The Secretary, C. H. Weatherwax, and the other officers are pushing preparations vigorously. They are building a nice one-half mile track and will have it in good shape and well finished before the opening day of the fair. Much interest is expressed by the producers of the county in the coming exhibition, and it is believed the industrial display will be better than ever made in the county before.

ALFALFA ON THE SAGE LANDS.—Along the Carson valley from Dayton to the Big Bend, fully 800 acres more of sagebrush land have been reclaimed this spring, and the growing crops look very promising. Notwithstanding the late frosts and the recent cold snaps, the alfalfa measures in many spots six inches. The crop will be ready for a first cutting by the middle of May.

The threatened difficulty between China and Siam has been averted. All the treaty powers have now recognized the complete independence of Siam.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

HAND PRINTING PRESS WANTED.—Parties having a second hand Washington or other hand printing press which they wish to dispose of, will please address this office, stating price, size and condition.

ANY PHOTOGRAPHER having a large Camera Box for sale will please notify "N. S." at this office.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco, (fourth floor).

GENERAL MERCHANDISE.

[WHOLESALE.]

WEDNESDAY M., June 5, 1878.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

California Fruit Growing Association.

Principal place of business, San Francisco. Location of property, El Dorado County, Cal.
 Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of May, 1878, an assessment (No. 3), of three (3) dollars per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 641 Sacramento Street, San Francisco, Cal.
 Any stock upon which this assessment shall remain unpaid on the eighth day of June, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the twenty-ninth day of June, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
 D. A. BROWN, Sec'y
 Office, 641 Sacramento Street, San Francisco, Cal.

Cherokee Flat Blue Gravel Company.

Location of principal place of business, San Francisco, California. Location of works, Cherokee Flat, Butte County, Cal.
 NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 39), levied on the seventeenth day of April, 1878, the several amounts set opposite the names of the respective shareholders, as follows:
 Names. No. Certificate. No. Shares. Am't.
 J. Bandman, 11, 320, \$ 10 00
 A. Casd., 17, 408, 230 40
 Flint, Peabody & Co., 19, 150, 24 00
 Flint, Peabody & Co., 20, 140, 8 00
 Pfeiffer, E. J., 10, 480, 24 00
 Schmidt, Louis, 8, 128, 6 40
 And in accordance with law and an order of the Board of Directors, made on the seventeenth day of April, A. D., 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of said Company, on Tuesday, the eighteenth day of June, A. D., 1878, at the hour of two o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
 J. W. CLARK, Sec'y.
 Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

Excelsior Silver Mining Company.—Lo

cation of principal place of business, San Francisco, California. Location of works, Potosi District, Lincoln County Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 10), levied on the twentieth day of April, 1878, the several amounts set opposite the names of the respective shareholders, as follows:
 Names. No. Certificate. No. Shares. Am't.
 J. Antonovich, 234, 100, \$25 00
 A. W. Lind, 261, 50, 12 50

 H. M. Pearce, 248, 100, 25 00
 L. Trahn, 262, 50, 12 50
 Adolph Wirtner, 252, 25, 6 25
 Adolph Wirtner, 253, 25, 6 25
 Salvo Russo, 239, 25, 6 25
 Peter Wiese, 215, 50, 12 50
 Peter Wiese, 219, 10, 2 50
 Peter Wiese, 220, 10, 2 50
 Peter Wiese, 257, 30, 7 50
 And in accordance with law and an order of the Board of Directors, made on the twentieth day of April, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, 304 Post Street, on the tenth day of June, 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
 FRANCIS P. DEVINE, Sec'y.
 Office, 304 Post Street, San Francisco, Cal.

Gover Mining & Milling Company.—Lo

cation of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the twenty-fourth day of May, 1878, an assessment (No. 36), of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.
 Any stock upon which said assessment shall remain unpaid, on Wednesday, July tenth, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the first day of August, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
 W. O. WILSON, Sec'y.
 Office, Room 8, No. 402 Front Street, San Francisco, Cal.

Summit Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the third day of May, A. D., 1878, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, Room 6, No. 318 Pine Street, San Francisco, California.
 Any stock upon which this assessment shall remain unpaid on the eighteenth day of June, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the Monday, fifteenth day of July, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
 J. W. CLARK, Sec'y.
 Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe for this scientific journal, especially devoted to their interests. It is a California enterprise, and compares favorably with similar organs of years more experience and age in the old countries.—*Colfax Enterprise.*

COPPER PLATING.

Highly Important to Foundrymen, Iron Workers and Machinists.

With the most extensive facilities on the Pacific Coast, I am now prepared to execute all orders for Copper Plating of Iron, Zinc and other metal castings of every size and description, at greatly reduced rates. Orders promptly filled and satisfaction guaranteed.

SAN FRANCISCO GOLD, SILVER, NICKEL & COPPER PLATING WORKS,
 Nos. 653 and 655 Mission Street, San Francisco.

J. O. Address: ALAMEDA, CAL

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly, showered through the heated air and gases within it, exposed to the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 95% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Number 24.

Motte's Mortar Mill.

There has been recently patented in Germany a grinding machine, under the name of mortar mill, which deserves the favorable notice of manufacturers who need to grind finely hard substances.

The figure shows the simplicity and solidity of the machine. It consists of a conical mortar, *a*, whose under part, *b*, is widened out into a hollow sphere. In this mortar moves a pestle, *c*, whose under part forms a segment of a sphere and whose upper part is a truncated cone. By means of a steel pin the pestle is accurately adjusted to the center of the mortar, and can, by means of a lever and screw, *e* and *f*, be adjusted at any desirable distance from the spherical bottom of the mortar. The pestle is put in rapid oscillation by means of the crank.

Material thrown into the mortar, dropping to the bottom of the cone, will be more and more grasped and crushed by the narrowing aperture. The finer pieces fall deeper into the cone, become more and more ground and finally pass between the spherical faces of mortar and pestle and are then ground to a flour, whose fineness is accurately adjusted by the screw. The grinding action of the pestle is so great that the hardest substances are almost instantly converted into powder and fall from the bottom of the mortar. In order to give the greatest amount of durability to the apparatus, the mortar, pestle and gearing wheels are made of hardened steel, as well as the pin on which the pestle turns.

Comprehensive experiments have proved the worth of this simple machine for the different objects for which it has been recommended. In many cases the now usual combination of stone-breaker, rolls and stamp mill has been replaced by a single mortar mill, which not only grinds large pieces to powder of the requisite fineness, but also with the use of less power and with a larger production.

The mortar mill is made in three different sizes and the parts are proportioned according to the particular use intended. The machine is particularly adapted to the following uses: The preparation of ores for metallurgical purposes, the grinding of stone for beds of streets and beton making, cement and mortar manufacture, the preparation of fire-clay, in porcelain and glass manufactures, in the manufacture of artificial fertilizers as well as in chemical and other industries.

The Philipsburg Mine.

[For the Press by WM. PURVINE.]

The mines of Philipsburg, Montana, were opened up in 1867, and have been worked at intervals ever since. The Hope mine, on Comanche hill, was opened the first season by a St. Louis company, and a 10-stamp mill with six of Wheeler's small pans and three seven-foot settlers erected, in which to work the ores. The mine at that time was not sufficiently developed to supply the mill with ore, and as a consequence the mill, after a brief run, had to shut down. Since that time further explorations have developed an abundant supply of ore of excellent quality to justify the company in adding 10 more stamps and otherwise enlarging their mill to double its present capacity. This mine occurs in a comparatively recent lime formation, and is a fissure vein with five to eight feet of ore of excellent quality and remarkably free, being a sulphuret of silver associated with carbonate and oxide of copper in a siliceous gangue, and is successfully treated in iron pans without roasting, using about 20 pounds salt, three pounds blue stone, and three-fourth-pound sulphuric acid to the ton. The ore is stamped through coarse screens, wet and ground three hours in the Wheeler pans before adding the mercury; 65% to 75% of assay value of the ore is recovered in the bullion which is 975 fine, with a loss of quicksilver of from two to four pounds per ton. David Carson, the Superintendent, is an excellent manager, and is making liberal dividends for his company.

The Speckled Trout was discovered in 1867, and was opened two years later by Cole Saunders. In 1870 a double stack was erected in which to smelt these ores, but it was found that 30% of zinc, and a small percentage of lead and very refractory gangue would not smelt to

advantage. These stacks were pulled down and five-stamps with two reverberatory furnaces substituted, and the metallurgical and chemical departments managed by C. A. Speights, a very skillful metallurgical chemist, who readily extracted 85% to 90% of the silver contained in the ore. This raised Philipsburg out of "the slough of despondency." These works were limited in capacity, rickety in the extreme, and very expensive to operate, but the shipments of

tively new at the business, has displayed a great deal of sound judgment in the management.

The Algonquin company, under the skillful management of J. K. Pardee, is opening a very valuable property (the Algonquin mine), and will probably, during the season, add another to the paying enterprises of the camp.

Murray, Durfee, Holland and Estell have very promising properties in the Salmon, Scratch-Awl, Startown and Blackmail mines.

CROSS SECTION OF COMANCHE AND TROUT HILLS, PHILLIPSBURG, MONTANA

bullion were immense, which induced some Philadelphia parties to buy the property, who, under the superintendence of J. K. Pardee, erected a 10-stamp mill with three Bruckner revolving cylinder furnaces and two Union pans, and two Varney pans with two six-foot settlers. The present company have added one cylinder, making four cylinders, and substituted a three-ton Purvine pan for one of the Union pans, and

The Speckled Trout is down to a depth of 330 feet, with 80 to 225 ounces ore in all the openings. The Hope mine is down 175 feet, with an immense supply of 40 to 200 ounces ore in all the openings. The Algonquin is down 180 feet, with a very great body of ore (5 to 12 feet), averaging 80 ounces per ton, with every indication of being one of the best mines in the Territory. The Scratch-Awl (Murray & Dur-

SECTION AND ELEVATION OF MOTTE'S MORTAR MILL.

added one eight-foot settler and a Hendy concentrator. The ore is roasted with 6% salt, each requiring from 15 to 24 hours' time. After roasting, the roast is screened, the lump returned to the batteries and the fine ore charged into iron fans with quicksilver, which are heated with steam, and run from 12 to 24 hours, and then discharged into the settlers. From the settlers the tailings are discharged into the Hendy concentrator, which recovers a considerable portion of what would otherwise go to waste. Frank Frisbee, Esq., although compar-

atively new at the business, has displayed a great deal of sound judgment in the management. The accompanying diagram will give the reader a good idea of the location of the various claims referred to. It shows a north and south cross section of Trout and Comanche hills, on which the mines are situated.

There are many other excellent prospects in this camp, but not sufficiently opened to determine their value. The accompanying diagram will give the reader a good idea of the location of the various claims referred to. It shows a north and south cross section of Trout and Comanche hills, on which the mines are situated.

The Timber Land Question.

As there has been some complaint in certain sections of the country about the policy adopted by Secretary Schurz for the protection of the timber on the public lands, the Secretary has addressed a letter to Congressman Page, explaining more fully the views entertained by the Department of the Interior upon that subject. Up to this time, parties cutting timber on the unsurveyed lands of the Government, have been regarded as trespassers, and, in some aggravated cases, have been prosecuted as such. While this restriction, in numerous instances, involves, no doubt, a great deal of hardship, the letter of the law, as it now stands, leaves the public officer no alternative but to proceed against offenders without regard to the peculiar circumstances under which these depredations upon the public property are committed. On this point, Secretary Schurz very properly observes that while the enforcement of the laws may be attended with much hardship in the case of miners and settlers, where the lands have not yet been surveyed, and timber cannot therefore be obtained from the Government by purchase, still public officials cannot treat the provisions of the statute as a dead letter, the only proper way for relieving these people being to change the law, adapting it to the existing condition of things which he has recommended and which will be accomplished through the passage of the Sargent bill, heretofore published and commented upon in the Press.

While this view of the question cannot be gainsaid, it would seem as if the Secretary might justly have claimed so much discretion in the premises as would have warranted him in overlooking that class of minor trespasses in which the farmer and miner take from the public domain no more timber than suffices for their own individual use, that is to say for fuel, fencing, building, the construction of flumes, sluices, etc. Where parties have gone into lumbering, making merchandise of the Government timber, they should unquestionably be stopped; more especially where they have conducted this business, as has often been the case, in a destructive and wasteful manner, nor should even the farmer or miner be permitted to help himself to this Government timber in a reckless way.

If the mountain forests possessed everywhere the property of certain and rapid self-reproduction common to those of the Sierra Nevada, their careful preservation would be a matter of less moment. But this is not the case in the arid basins of the interior. Once cut off, it will be a very long time before the timber there can be replaced, the original growth being almost everywhere comparatively stunted and scattered. Once across the Sierra and we see no more the thickly standing and stately trees characteristic of the ocean-facing slope. The summit of the great snowy range marks the line where the forests begin to dwindle. East of this the trees are smaller, more scattered, and the timber of a poorer quality. They are also of a slower growth. Broad valleys and vast treeless plains intervene between the mountain chains on which alone any timber is found. The mining States and Territories of the interior are the mostly poorly wooded sections of our entire country, save only the regions of the Platte and the staked plains of western Texas. The plan of protecting the forests on the Government domain should therefore be rigidly adhered to. The policy foreshadowed in the Sargent Timber Enactment is a good one. Surveys should be extended as rapidly as possible in order that parties desirous of purchasing these wooded lands may be able to do so. This accomplished, the Government should guard against further trespass in the most vigorous manner. Beyond this it need give itself no further trouble. With these lands once reduced to private possession, there will be an end to the wasteful use of timber.

The Grand Jury of Ventura county have found true bills for murder against Sprague, Jones, Carlee, Lord, McCart, Hunt and Churchill for the killing of T. Wallace More. The trials will commence on the first Monday in July.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ems

Notes on Amador County.—No. 1.

[From Our Travelling Correspondent.]

New Reduction Works.

Mr. N. L. Gage has just completed at this place a reverberatory furnace of four tons capacity for reducing the gold sulphurets concentrated by the various mills here and in this vicinity. The process adopted by him being the same that has been so long and successfully used on this coast by Deitkin, Maltman and others. The furnace was built by Mr. A. C. Gove, of Nevada City, a furnace builder by trade, and who has been very successful in the construction of such works. That this enterprise will eventuate in success is much to be hoped, as additional facilities for treating this class of material are needed here. The proprietor of these works has had some experience in this line of business, and being a man of integrity will be likely to enjoy the confidence of the community should he permanently establish himself here.

Amador Reduction Works.

These works have been operated for a number of years with satisfactory results. They reduce here five tons concentrated sulphurets per day, and guarantee returns above 80% of fire assay. The proprietors do their own pulp and bullion assaying, for which they have every convenience. The business is managed by the owner, C. J. Garland, assisted by Mr. E. C. Voorhees. Mr. Garland also operates a branch at Drytown, in this county, where three tons per day are reduced.

A Telephone.

This, the last horn of the great inventions of the age, having gained a foothold in the metropolis, is making its way into the interior. Mr. Star, of San Francisco, having just established telephonic communication between this place and the Amador Lumber Co.'s office, one and one-half miles distant, and the Oneida mill, two miles distant, the instrument working satisfactorily. He is now connecting the express office here with that of the Amador Dispatch, at Jackson, four miles off, the work to be completed in a few days, after which it is probable the wire will be extended to other places in the vicinity. C. J. Nickerson, of this town, is the agent of the Bell Telephone Co. for the counties of Amador and Calaveras.

A Fine Cabinet.

Messrs. W. S. Smith and D. A. Patterson, miners of this town, are the collectors and owners of one of the finest cabinets of minerals and metals in Amador county, and one not surpassed perhaps by many in the State. Their collection embraces specimens of all the metal-bearing rock in this county, as well as some from other counties in the State and from other States of the Pacific slope. Some of these specimens are very rare and valuable, especially the collection taken from the mines in Amador. They also have a large collection of fossil shells and bones and coprolites and petrifications, found in different parts of the county, together with a great variety of beautiful crystals of siliceous, spars of all kind and color, chalcidony, smoky quartz, jasper, agates, augite, cornelians, tourmalines, serpentine, Amazon stone and many other stones, selected and arranged with a taste and judgment that evinces a knowledge of mineralogy not common among men who labor for their living, as these men do. They have also a fine display of curiosities and relics, useful and instructive, this collection being a good index to the mineralogy of Amador county.

The Oneida Mine

Is situated about half way between the towns of Sutter Creek and Jackson. In this mine a depth has been attained of 1,140 feet, there being here pay ore in sight sufficient to run their 40-stamp mill for three years. The company is incorporated in San Francisco, but the business here is managed by Robt. Robinson, a man well qualified for the trust. Adjoining the Oneida on the south is the Kennedy Gold Mining Co.'s hoisting works and mill. This company have sunk three shafts on their ledge to the depth of 800 feet, 200 feet, and 100 feet respectively, and have plenty of ore to keep their 20-stamp mill constantly employed. Superintendent, James Fleming.

The Other Mines

In this town and vicinity are represented to be in a prosperous condition. The Lincoln is owned by Senator W. M. Stewart, his brother Sam and a Scotch company. The Stewarts have leased the whole mine, Samuel being Superintendent. They have in connection with the mine a 40-stamp mill run by a four and one-half foot water-wheel—Knight's patent, which crushes 100 tons of ore per day of 24 hours. The mine and mill are in first-class condition and the owners and lessees are happy, in the realization of a fair remuneration for their investment.

Amador Con.

This is the old Eureka mine, formerly owned by Alvinza Hayward, and is noted for having the deepest shaft (2,100 feet) of any gold mine in the world. There are not, however, working

at present in their lower levels, but are taking out sufficient ore to keep their 60-stamp mill constantly at work. The Mahony, owned by the Stewart Bros., is shut down at present, though represented to be one of the best mines in the county. W. G. A. Sutter Creek, June 8th, 1878.

Determination of Minerals Under the Microscope.

EDITORS PRESS:—I notice in the last issue of the PRESS a lengthy article from the pen of Melville Attwood, Esq., which is reported to have been read before the Microscopical Society recently, in which he utters some sensible remarks upon porphyry.

While I agree with him in some of his views thus laid down, I also differ in some respects; and were it not that in entering upon that discussion it would open up the entire subject of the "status of the rock," I would like to help in his effort to establish a clearer apprehension of that special point, but must, therefore, pass it. But there is another matter of which he treats in which he hurts the cause he aims to aid, and that is his attempt to introduce the microscope in the manner which he adopts of thin plates, ground, etc. I object for its impracticalness in several ways.

To illustrate, suppose that one wanted to know if the little Amador and Amador Consolidated gold mines were on the same great ledge, were a sample each of the hanging wall of the two mines, three miles apart, presented for examination under the microscope, or otherwise, the one would show it to be a fine-grained blue trap, commonly called greenstone, while the other would show as an amygdaloid containing a large admixture of its associate talc slate.

The chemical and mechanical—if I may so call it—elements are unlike in the two mines, and yet they are, beyond a question, upon the one and the same belt of greenstone. Let him examine the rocks on the Mariposa estate and he will find the great belt of trap rocks differ widely at various points, and hence no two samples would necessarily appear the same under the microscope as used by him.

A sample of the rock associated with the Rattlesnake quicksilver mine, of Sonoma, appears to be a genuine sandstone, but another sample from the same rock, one to five feet distant, will show that it is a plutonic rock—a trachyte—and not a sedimentary rock at all.

Now it is very important that a better apprehension of the character and the status of the rocks of the earth's surface should obtain, but it is I think a grand mistake to teach the method of investigation as laid down by Mr. Attwood; for the reason that the whole matter is based upon the fallacy that rocks of any class are *unmistakably homogeneous at all points* and hence every sample of a particular belt of rocks must have the same appearance under the microscope, absolutely so, or else it cannot belong in the same relation to the mine itself of that particular belt of mines and rocks.

The evil of the view presented is that we get the attention so closely riveted upon the infinitesimal detail and littleness of mineralogy that we fail to rise to the apprehension of the few grand simple geologic truths which will disentangle the mysteries of mining.

While we are studying the infinite mineralogical detail of rocks we fail utterly to apprehend the grand, simple, comprehensive fact that in relation to the metals in veins the rocks of the earth's entire surface may be divided into three classes, viz.: the primitive, the trappean and sedimentary, and that the belt of rocks under examination at any time is not necessarily absolutely homogeneous at all points.

What we want is a clear apprehension, among experts especially, of the relations of rocks and ore veins, a work which can be accomplished only upon and after years of study and investigation with microscopic glass in hand in the fields of nature among the mines. It is no superficial holiday work that can be entered upon empirically by a trivial effort. It cannot be learned from books and hand specimens in the study and laboratory, as Mr. Attwood would seem to teach.

We have no mining science. The commonly accepted scheme of geology does not and cannot furnish an answer to the question, "What constitutes a true vein?" Hence, then, I think that Mr. Attwood's scheme of determining the true character and status of the rocks is entirely impractical and impracticable; and this attempt to teach the examination of rocks in their relation to ore veins is a mistake, and so I enter my protest right here and regret that it is not practicable to open up the entire subject of rocks and their relation. The subject is too big for the pages of the MINING AND SCIENTIFIC PRESS.

O. W. EASTON,
Geologist and Mining Engineer.

TRIUMPH OF SOBRIETY IN MAINE.—In Maine, the friends of temperance, persevering beyond example elsewhere, have finally succeeded in putting all drinks containing alcohol out of the reach of everybody in the State; or as Wendell Phillips says, "not one man in 500 in Maine can get at liquor." This has been accomplished by a series of enactments beginning about a third of a century ago. As a law was passed and found ineffectual, it was followed by another, until, at last, this degrading evil seems to be mastered and driven from the State.

Discovery of a Mammoth Cave in Wyoming Territory.

In the early part of May, a herder discovered a very remarkable cave at Table Mountain ranch, in this Territory. The entrance, instead of being horizontal, is perpendicular. Having a lariat of 50 feet, he let it down without touching bottom. He then dropped down a stone or two, and, from the reverberations, concluded it was of immense depth. Last Sunday, a dozen of us got together with ropes, a windlass, lanterns, etc., and proceeded to examine and explore it. Having fixed a strong windlass and attached a stout rope, a man descended with a lantern, his feet in a loop of the rope and holding on with his hands. It is a sheer descent of 82 feet perpendicular, to where an incline of 45 degrees commences, that upon going down about 100 feet more, becomes nearly level and branches off into various rooms, vaults and apartments. The sensation of descending is novel as well as hazardous. On reaching the bottom, I entered one of the vaults for a distance of about 300 yards, when I came to what I supposed to be the end. But on a closer examination, I discovered an aperture large enough to admit me, and, through a partition six feet in thickness, emerged into a vault of immense dimensions. Here the ceiling is fully 60 feet from the floor, and was studded with countless stalactites of all sizes, from that of a small icicle to a foot in diameter and from a few inches to 15 feet in length. The floor is also studded with cones and stalagmites, like inverted icicles, and presented a weird and picturesque perspective. In many places the stalactites are joined together, having the appearance of huge hour-glasses, and forming a number of pillars from floor to ceiling, adding to the grotesque grandeur of the scene. I penetrated about 400 yards into this vault, from which other vaults and apartments led off from either side; but, fearful of getting lost, I proceeded no farther in that direction and can only conjecture its length. Members of our party explored other vaults and passages in different directions, and from their descriptions, I conclude that the greater part of the Table mountain is fairly honey-combed by this cave and its numerous ramifications. All the passages radiate from where the incline commences, 82 feet down. The aperture of the surface is only eight feet long and four feet wide, but enlarges as one descends, being bell-shaped. It put me in mind of entering the cupola or dome of the Capitol at Washington, at the top and descending to the floor below. One would get this impression on looking upward, it being nearly circular and gradually narrowing from the floor to the apex. Bones of a large variety of animals are strewn around, which probably stumbled into this fearful pit years and ages ago. Buffalo heads, and those of elk, deer and antelope are numerous, while bones of smaller ruminants, carnivora and rodents are strewn around. Bones were also found supposed to be those of human beings, but in fragmentary sections. Professors Darwin, Cope, Leidy, or an Agassiz, might possibly classify them, and give them lockjaw-contracting, unpronounceable names. But as our party could not be charged with profound erudition, and were utterly innocent of many of the "ologies," we didn't attempt it. The formation throughout the interior of the cave is cretaceous, or lime rock; but near and at the surface the formation is granite, gneiss, conglomerate and sandstone. The stalactites are opaque crystallizations, some of them being dense and hard, and when struck together give off a metallic sound. Others are soft and chalky, and at the pendant extremities of the consistency of moistened gypsum.—*Cor. Grand Rapids, Mich., Eagle.*

Mementoes of Bygone Black Hills Miners.

Mr. Witcher gave us an interesting account of the evidences recently found that men had gone into the Black Hills mines years ago, but never came out of them. Such accounts have been published in the Black Hills papers, but never elsewhere. In Rutabaga gulch, between Deadwood and Bald mountain, an old tunnel has been discovered, 30 feet into the side of the gulch, evidently made years ago. About 40 miles above Deadwood an ancient stone cabin has been found, and evidence that it was built by a party of brave adventurers, who, satisfied of the richness of the country, boldly penetrated into the wilderness, braving the danger from Indians and the severe winters, and falling victims, most probably, to the former.

In other places broken picks have been dug up, from an evident burial of many years. The remains of what was evidently a log harricade have been found, the logs and trees in the vicinity being filled with leaden bullets; while behind the harricade were the skeletons of two men with bullet holes in the skulls. These are believed to be the skeletons of white men who attempted to defend themselves from the Indians, but fell in the defense. Near the stone hut is a rock on which is chiseled "1852," and a portion of a memorandum book was found with the date 1852 still legible upon it, but with the other writing defaced and erased by time.

In excavating for a theater at Deadwood a few weeks ago the diggers unearthed a bottle of painkiller six feet below the surface, and came upon a place where there had been a fire at the same depth. Broken pickaxes and hatchets were also found there. Old mines have been found, where claims had evidently

been worked for some time, and in some places new mines suddenly run out, giving evidence that parts of them had been worked by somebody in the distant past. There are trails of trees having been blazed, and these blazes show evidence of having been made as long ago as the date above given, or thereabouts. Other striking proofs are found of some civilized people having 20 or 30 years ago known something of the valuable mineral deposits of that country, and having, "in the mad pursuit of wealth," gone there to unearth the treasures, and lost their lives in doing so. Certain it is that they never came out. Swift and sure the Indians swooped down on them, and left none of them to tell the tale, while the imperfect relics and marks of these expeditions alone point to the fact that these men were here, and that the Indians wiped them off the face of the earth, and for almost another generation kept the secrets of the hidden treasures locked up in the then almost impenetrable wilderness.—*Sioux City (Ia.) Journal.*

Academy of Sciences.

At the last regular semi-monthly meeting of the California Academy of Sciences, several donations of ores were reported from different citizens, the most noteworthy being some tin ore from San Bernardino county, presented by the Hon. C. Cole, and some copper slag by Thomas Price, metallurgist. This latter was found in Alaska, and is supposed to be the refuse from some ancient copper smelting by Indians or Russian trappers. Rev. Dr. Scott donated some Swiss relics, found in the lake dwellings. Fish Commissioner B. B. Redding presented to the Academy a fish resembling the skate, which he had received from A. W. Bush, of the Sandwich islands, where the fish is found. Even there it is quite rare, and the Kanakas have a superstition that it never comes inshore unless to die. It is only caught when close to the shore. The species of the fish is unknown. The specimen will be examined, and if no determination is arrived at it will be sent to the Smithsonian Institute for classification.

The Academy had on exhibition some elegant geological and topographical atlases to accompany the report of the geological exploration of the parallel of latitude, Clarence King, geologist, in charge.

Dr. Gibbons made a few remarks on the movement of atmospheric currents as illustrated by balloon ascensions. The gentleman said that the ocean breeze, which brings us the fog and moisture, is very low, above it is a series of variable currents, constantly shifting. Still above these, say at about 3,000 feet elevation, a steady belt exists, continuing for a long elevation. He had not looked into the matter very closely, but would continue his investigations and give the result to the Academy.

A gentleman inquired about the habits of shad on this coast as compared with the habits of those on the Atlantic coast. Fish Commissioner Throckmorton replied that the salmon invariably returns to the place of its propagation, and that on the Atlantic coast the shad does likewise. On this coast, however, the shad seems to have taken a new departure. Since 1870, 350,000 shad have been propagated here, chiefly near Tehama, and since 1870, shad have been caught along the coast from Wilmington to the Columbia river. This strange freak of the shad in abandoning his natal place is laid to the herring, from among whom the shad is frequently taken. The herring invades the shad from the path of his forefathers. He seems to have such an influence over him—his companionship seems to be so attractive—that the patrician shad willingly renounces his birthplace and travels about the ocean with schools of plebeian herring. The shad of the Atlantic coast always makes his pilgrimage to his birthplace.

REPTILES AND INSECTS IN AUSTRALIA.—The reptiles are really beautiful—crocodiles in the north and snakes, lizards, scorpions and centipedes in the south. I shall not readily forget the sensation I experienced when one night a huge black centipede, eight inches long, crawled upon my neck with his horrible 64 legs and made his way to my feet leisurely much to my disgust, and though he was probably only a few seconds I thought him slow. He is in the museum at Adelaide, with all the whisky he can drink. Insects are wonderfully prolific—mosquitoes and flies being particularly abundant. The native children are sometimes hardly recognizable, so completely are they covered with flies, filling their eyes, noses and mouths. When eating, it requires dexterous maneuvering to get a piece of meat into one's mouth without its complement of flies. Spiders are very common, as also are ants, the tarantula being the most formidable of the former, and the bulldog ant the worst species of the latter. These ants are an inch or more in height and about two inches long. They all fight fiercely, and their sting is not at all to be desired. They catch hold of your skin with their nippers, bend the body under like a scorpion and put the sting gently in, leaving the venom and sometimes the sting itself. When camping near a nest of them, we generally thrust a firestick in the hole, which has the effect of keeping them at home.—*Lecture by Jesse Young, the Explorer.*

THE Prescott Enterprise says that the trade of Arizona now amounts to \$4,500,000 per year and that it is increasing rapidly.

MECHANICAL PROGRESS.

Collapse Cured by Corrugation.

It is a quarter of a century since a corrugated form for boiler-flue tubes was first proposed. Then the advantage of corrugation was claimed to be in the increase of heating surface, but now the idea of corrugating furnace-tube plates has occurred to many engineers, both with a view to increase the efficiency and extent of the heating surface, as well as to increase the collapsing strength of the tube. The great interest taken by engineers in the results of the tests recently undertaken by the Leeds Forge Company, in England, for the purpose of ascertaining the relative strength of plain and corrugated tubes, shows that the time is ripe for the introduction of a strong form of tube, and if the corrugated tube answers as well as it promises to do, it will be very extensively used, especially for marine boilers.

The great strength or stiffness of the corrugated tube to resist collapse is due to the arched form of each corrugation resisting local distortion, and should local distortion arise, the depth of the beam, regarding the distorted arc of the tube as such, due to the corrugation, strongly resists any further deflection. The corrugated is stronger than the plain tubes for same reason that an L or T iron ring is so much stiffer to resist collapse than a plain ring of the same thickness of metal. The stiffness is, of course, additional to that imparted by the circular form of the tube, which the corrugated possesses in common with the plain tube.

What the actual collapsing strength of tubes may be of different thickness and diameter and of different degrees and proportions of corrugation, can only be determined by experiment. They are, however, immensely stronger to resist collapse than plain tubes, and there does not appear to be any reason why they should ever be made over three-eighths inch thick, which will be a great advantage when tubes as usually made at present have to be made nine-sixteenths inch thick to conform to certain rules.

The only way at present to make a satisfactory job of the corrugated tube appears to be to make it of one length of plate circumferentially, to weld the longitudinal seam and then corrugate the tube by rolling, swaging or hydraulic pressure. In tubes about three feet in diameter, the requisite length can only be obtained by arranging the plate so that the distorting action of the corrugating process is brought to bear upon it across the fiber, or in the manner in which the plate is least able to bear it. Even best Yorkshire plates, as usually made, cannot be expected to stand this severe test without considerable risk of failure. This is probably the reason why the attempts to make corrugated tube plates have hitherto failed, and the form of the well-known "bowling hoop" appears to be an outcome of the idea of making corrugated flue tubes.

What was required to insure the successful manufacture of these tubes was a plate that would show an elongation across the fiber greater than only 50% of that along the fiber, and with an ultimate breaking strength crosswise more than only 90% of that lengthwise, which may be taken as the average performance of best Yorkshire plates. The Leeds Forge Company have apparently succeeded in making their plates in such a manner that they are able to bear with tolerable certainty the corrugating process after they have been welded into rings. Thus one advantage for the user of corrugated tubes is that he is pretty sure not to be troubled with blisters making their appearance after the tube has been at work awhile, as any lamination is sure to be brought to light by the operation of corrugating.

Forging and Tempering Iron and Steel.

The forging and tempering of iron and steel can be greatly enhanced, according to Edward Blass, of Cleve, Prussia, by dipping the metal, in whatever form, in fused salt. This dipping in salt is also well adapted for annealing steel without the oxidation of the surface. If the metal be rusted, it must be allowed to remain some time in the bath. Borax can with good effect be mixed with the salt. Metal "purified" by such an immersion is very susceptible to galvanic depositious, and can easily be coated with copper, zinc, tin, nickel, silver, etc. For iron in the spongy or powdered state as obtained from the reduction of the ores, the salt bath is especially adapted, for it augments the combination of the particles by making their surfaces free from impurities. To prepare the bath for an application as here proposed, the salt must be fused in a puddling furnace, and the iron sponge, with the addition of a flux, be added in small quantities, so as not to vitrify the salt. The iron is left in the furnace till the flux has combined with all the impurities and formed a slag, whereupon the iron is taken out and forged together. While the iron is in the furnace it should be constantly covered with the salt, so that oxidation be prevented. For the hardening of iron the salt is fused in a convenient vessel and the object immersed, and from time to time a small quantity of ferro cyanide of potassa added, one pound or two pounds per 100 pounds of iron. The articles, according to their thickness, are permitted to remain from five minutes to 30 minutes in this bath, and are

then plunged in water containing, in 100 parts, one part of hydrochloric acid, five of wine vinegar, and one of salt. If the objects are to have a silver luster, they should be immersed for a few minutes in a mixture of three parts of wine vinegar and one of hydrochloric acid.

Hard and Soft Solders.

Edward Kirk, in his writings "on the founding of alloys" for the *Iron Age*, gives the following formulas for hard and soft solders: The following metals and alloys are usually used as solder in the art of hard soldering:

Fine or pure gold, rolled or beaten into sheets, and into shreds, or small pieces, is used as the solder for soldering chemical vessels made of platinum.

Silver solder, composed of 4 parts silver and 2 parts yellow brass is much used for hard soldering. The brass is used in this solder, so that the operator can tell when the solder is fused by seeing the blue haze caused by the burning of the zinc. This solder is either rolled into thin sheets, and cut into small bits for use, or is granulated while hot.

The gold solder, the composition of which is given under the head of gold alloys, is rolled into thin sheets and used for soldering gold alloys. Gold soldering is generally done with the blowpipe, as the work is seldom large enough to require the brazier's hearth.

Pure copper, in shreds, is sometimes used for soldering iron.

Spelter solders, granulated while hot, are used for soldering iron, copper, brass, gun metal, German silver and sometimes for gold and silver alloys.

As a cheap substitute for silver solder the white or button solders are commonly employed for the white alloys, such as German silver, gun metal, etc.

The flux most generally used in hard soldering is borax. In fact there is very little hard soldering done without the aid of this flux. It is generally granulated, and used in the dry state for large or heavy work, and for small work it is generally used in solution with water.

The soft solder used by plumbers, called sealed solder, is composed of 2 parts of tin and 4 parts lead. This solder melts at about 450° Fah.

The common solder used by tinsmiths is composed of 4 parts tin and 2 parts lead. This solder melts at about 350° Fah.

The bismuth solder is composed of 7 parts bismuth, 5 parts lead and 3 parts tin. This solder melts at about 225° Fah.

All the tin and lead solders become more fusible the more tin they contain. Thus, 1 part tin and 10 parts lead melt at about 550° Fah., while 6 parts tin and 1 part lead melt at about 375° Fah.; and all the tin, lead and bismuth solders become more fusible the more lead and bismuth they contain.

The fluxes used in soft soldering are borax, sal-ammonia, chloride of zinc, common resin, Venice turpentine, tallow and sweet oil. The most commonly used for ordinary work are common resin and chloride of zinc.

FINE METAL WORKING.—A monument in fine art metal work has just been erected in St. John's church, Priess street, Edinburgh, to the memory of Dean Ramsay. The monument, which is of bronze, silvered and gilt, consists of a projecting canopy, surrounded by a series of enameled plaques, representing the thistle and the rose, and alternating with clusters of amethysts and crystals. The crest is of silvered foliage and enameled daisies; while the canopy is surmounted by a cross, enriched with amethysts and crystals, supported by shafts bound with traceried fillets, and the base consists of an inscription tablet, with a border of enameled forget-me-nots, onyx stones and pebbles.

GUNS.—The heaviest guns in the American navy are 15-inch smooth bores, weighing 42,000 pounds, with a solid projectile of 440 pounds, a shell of 352 pounds and an initial velocity at the muzzle of 1,560 feet a second. The English muzzle loader of 80 tons costs \$50,000, the 100-ton \$50,000, and Krupp's breech loader, exclusive of the carriage, \$100,000. Not long since Herr Krupp proposed to lend the English government a gun for \$75,000, but he required an order to be given, in case of success, for guns to the extent of \$10,000,000. These terms were held to be much too onerous and the offer was declined.

INTERESTING EXPERIMENTS IN STEEL PRODUCTION.—The Belgians have been credited with the ability to produce a larger quantity of steel in a given time than can be accomplished in England, but experiments recently made at the Barrow Steel Works show that the Belgians have something to learn yet, as it is claimed the greatest output of steel was made for a given amount of producing machinery ever yet recorded. Two 12 hours' turns were taken, and in the Bessemer department 479 tons, 14 cwt., 3 qrs. of ingots were made by 77 blows out of six vessels in three pits.

GERMANY AND HOME INDUSTRY.—News comes from Berlin that the German government has given a secret but general order that all articles used in the government establishments must in future be of home manufacture. This command applies, among other items, to steel, files, iron, and even coals.

SCIENTIFIC PROGRESS.

Sulphur in Organic Substances.

The following account of a new method for the estimation of sulphur in organic and inorganic substances, devised by Messrs. M. W. Iles and C. Fahlberg, of Johns Hopkins University, is sent to the *Journal of Chemistry* by the authors. The method may be briefly stated as follows: From 25 to 50 grammes stick potassa is fused in a large crucible, preferably a silver one; to the partially cooled mass is added from 0.1 to 0.5 gramme dry substance to be analyzed. Heat is now gently applied until all the bubbles have disappeared, and the liquid has assumed a quiet fusion, and there is noticed upon a marked increase of heat a slight vapor. This operation is an important one, but generally does not take more than from 15 to 25 minutes.

The cooled mass is dissolved in water, transferred to a beaker diluted, and filtered. To alkaline solution is added 30 to 50 cc. bromine water. The solution is then stirred, and acidified with hydrochloric acid. Heat is now applied until the liberated bromine has been expelled. To the hot solution barium chloride is added, and the amount of barium sulphate estimated in the usual manner.

It will be seen from the above statement that the operation is an extremely simple and expeditious one, and that it has a decided advantage in requiring no complicated apparatus.

The fusion with potassium hydroxide has for its object the complete transformation of the sulphur, both in organic and inorganic bodies, into a sulphite. The potassium sulphite is converted into potassium sulphate completely by the liberation of both oxygen and bromine *in statu nascendi*. The accuracy of this method has been verified by a number of quantitative determinations, both of inorganic and organic bodies; for the latter purpose it has been found extremely valuable.

THE HUGHES TELEPHONE.—The eminent inventor of the well-known Hughes type-printer, says the *American Manufacturer*, has made the startling discovery that certain unhomogeneous conducting substances placed in circuit with a battery possess the property of converting sonorous vibrations into undulatory currents of electricity, by which not only can notes and articulate speech be transmitted to a distant telephone placed in the circuit, but sounds so minute as to be otherwise inaudible can be magnified into loud noises. Of all the marvels connected with telephonic electricity, we have no hesitation in saying that Prof. Hughes' discovery of the sensitiveness of certain compound structures or unhomogeneous substances to minute vibrations is the most marvelous of all. It opens up a vast field of philosophical inquiry and places in the hands of the physicist a detector of sounds and of mechanical vibrations so small as to be altogether unsuspected. It, in fact, gives to him the means of constructing instruments which will be to the ear what lenses and microscopes are to the eye, and at the same time as a telephonic transmitter, it is an improvement upon Prof. Bell's telephone, transmitting louder and clearer articulation. But the most extraordinary part of Prof. Hughes' discovery is the ridiculous simplicity of the apparatus employed; a few French nails, a few sticks of charcoal, a tube or two containing powders, a little sealing wax and a few pieces of wood, and any boy can in a few minutes construct a transmitting telephone surpassing in sensitiveness the beautiful instrument of Prof. Bell, which it does not altogether supersede, for that instrument is still employed by Prof. Hughes as the receiver.

BALLOONING.—Mr. W. B. Woodbury has recently proposed an ingenious idea for taking photographs of an enemy's works from a balloon, without necessitating the presence of an aeronaut in the car. Electrical wires are run along the cable by which the air ship is held captive. Instead of a car a box is provided, inside of which another box is pivoted, so that it will keep horizontal. In the inner box is the photographic apparatus, and over the lens is an ebonite shutter, moved by the current, to open or shut instantaneously. There is also a sensitized tissue, on rollers, in rear of the lens, which is operated by clock-work, also controlled by the current. When the balloon is elevated to the required height, the lens properly focused and the tissue in position, the shutter is set in motion by the current, giving instantaneous exposure. A photograph is thus obtained, and, by further controlling the clock-work, fresh sensitized surface may be exposed and additional images taken.

ENTOMOLOGICAL.—Prof. C. V. Riley, late State Entomologist of Missouri, has been appointed entomologist to the Department of Agriculture of the United States. He has accepted the position, and will shortly remove to Washington City. This is one of the most gratifying announcements we have lately had the pleasure of making. Prof. Riley is the leader in what may be called the industrial development of entomology, and his service to the country in his new field of work will be proportionally to its needs, which are almost incalculable. We are glad of the appointment and acceptance.

The Brain of the Chimpanzee.

Dr. E. C. Spitska makes a detailed report of the autopsy of the dead chimpanzee, recently made at the New York Aquarium before many distinguished surgeons and scientists of that city.

Species, *Troglodytes niger* (chimpanzee); sex, male; age, about two years. All the organs greatly resemble those found in the human race. When the brain was removed all present were struck by its being almost indistinguishable from that of a human infant, especially at its base. The cerebrum was richly convoluted, and overlapped the cerebellum about one-third of an inch.

It had also the same lobes, and was as rich in convolutions as the brain of a Bechuana, possessing also a well-developed island of Reil. Careful examination, however, showed that it had also an operculum of the occipital lobe, which is not found in the human subject. One of the most interesting features of this brain was the absence of a trapezium, and the presence of the olivary bodies. Now, although a rudimentary olivary body exists in the lower mammalia, yet it causes no perceptible prominence of the medulla, and such a prominence is first indicated in the baboon. But in this chimpanzee it was as full and large as in the human race, a fact in full accord with the high development of the lateral lobes of the cerebellum, for the olivary bodies keep pace in development throughout the animal kingdom with the development of the cerebellar hemisphere.

The island of Reil, whose relations to the higher faculties are strongly documented by the prevailing physiological belief that is subservient to the faculty of speech, was also in this instance large and well developed.

ANOTHER FERMENT.—A chemical question which has caused much discussion for years, now seems in a fair way to be solved by the microscope. It is a well-known fact, says the *Journal of Microscopy*, that nitrogenous substances in soil, or under proper conditions elsewhere, have their nitrogen rapidly oxidized to nitric acid while undergoing decomposition. Numerous explanations of this action have been offered, but thus far all have failed to give entire satisfaction. The latest results seem to indicate that a ferment takes place in the operation. The details of the experiments are not at hand, but Schloesing and Muntz, followed by other investigators, have found that those agents, such as chloroform or heat, which kill or prevent the growth of plants, also arrest this action, and that a soil in which all organisms are destroyed by heat will not cause oxidation of this kind, so long as it is protected from germs, but the addition of a very little common soil will start the process. It does not appear that the specific plant engaged in this important operation has been isolated as yet. If there really is such a ferment, it must be widely distributed and of vast importance.

MICROSCOPICAL CONGRESS.—The *Journal of Microscopy* says that it is proposed to hold a Microscopical Congress next August at Indianapolis, at which it is expected that all the prominent microscopical societies will be represented. This Congress, if it should meet with general support from the microscopists of the country, cannot fail to effect much good. It ought to bring together all the prominent workers in the country, make them personally acquainted with each other, and develop by discussion many points of great interest. We are satisfied that many of the discussions which have stretched to great length when conducted by correspondence only, might have been settled satisfactorily by a very short personal interview. We are happy to say that the meeting promises to be largely attended. Particulars in regard to the arrangements which have been made, may be found in a circular which may be had by addressing Dr. W. W. Butterfield, Indianapolis, Ind.

ANTHROPOLOGY.—We receive the first number of a quarterly magazine called the *Antiquarian*. It is to be devoted to early history, ethnology and archaeology. The editor is Rev. Stephen D. Peet, of Ashtabula, Ohio, corresponding Secretary of the American Anthropological Association. The first number promises well for the future of the publication. Its leading article is on the ancient garden beds of Michigan, by Bela Hubbard, and it is fully illustrated by diagrams. Another paper is on mounds and earthworks, relating in part to the mounds in Washington Territory. We have no doubt the *Antiquarian* will be highly esteemed by all anthropologists as a medium for intercommunicating the results of their studies. The publishers are Brooks, Schinkel & Co., Cleveland, Ohio.

THE EASIEST WAY TO DROWN.—Dr. R. S. Tracy, in the *Popular Science Monthly*, says that if death by drowning be inevitable, as in a shipwreck, the easiest way to die would be to suck water into the lungs by a powerful inspiration, as soon as one went beneath the surface. A person who had the courage to do this would probably become almost immediately unconscious and never rise to the surface. As soon as the fluid has filled his lungs, all feelings of chilliness and pain would cease, the indescribable semi delirium that accompanies anaesthesia would come on, with ringing in the ears and delightful visions of color and light, while he would seem to himself to be gently sinking to rest on the softest of beds and with the most delightful of dreams.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

BUTTE.

BIG GOLD BARS.—*Mercury*, June 7: In our issue of May 24th we spoke of having seen at Rideout, Smith & Co.'s bank a bar of gold, containing \$32,000, from the Spring Valley mining and irrigating company, of Cherokee. On Wednesday this same company sent down to the bank a bar which contained \$21,000, making \$53,000 they have sent down within two weeks.

NUGGET FOUND.—A lump of gold taken from the "top dirt" of O. P. Powers' mine, across the river, was left at the bank of Rideout, Smith & Co., a few days ago. It contained between \$3,000 and \$4,000 gold of the finest quality.

CALAVERAS.

AT WEST POINT.—*Chronicle*, June 8: Needhardt had 25 tons of quartz crushed that yielded \$1,500; \$60 per ton. Andy Shenake recently discovered a vein four feet wide, that prospects \$30 per ton; 25 tons of Lone Star rock paid \$30 per ton. Rose & Porteous are putting up a mill on the Bummerville mine. Champion, taking out rock.

NEVADA.

THE BYRNE MINE.—*Transcript*, June 9: We are informed by Superintendent R. M. Fryer, that this company will get under full blast inside of 12 days. Three hoisting works will be erected on their claim at Gold Flat, and a mill will be put up during the present season at some point convenient to the different localities where the ledge is being developed. A large force of men will find steady and lucrative employment as a result of this new and important mining enterprise. Previous developments and present indications are said to fully warrant the beginning of operations on the extensive sale above outlined, and the management have the utmost confidence in the future greatness of the Byrne. The gentlemen who are engaged in opening up these extensive claims are among the most experienced mining operators and owners on the coast, and do not belong to the class who ignore the words of Davy Crockett, "Be sure you're right, then go ahead."

VERY FAIR.—A clean up of 84 tons of quartz from the Deadwood mine, near Nevada City, yielded 150 ounces of gold, and average of \$30 per ton.

WATT GRAVEL MINE.—Shaft down 422 feet, and drift run 260 feet, the men working in fine-looking gravel, where they have got a number of colors to the pan. They are at present from 30 to 40 feet above the bedrock, and will commence sinking again in about a week.

SAILOR FLAT HYDRAULIC.—On this claim, which adjoins that of the Blue Tent Co., they are using about 500 inches of water daily, and employing a force of ten men. The property comprises 600 acres, and is very rich, an average clean-up of \$6,000 being made every six or eight weeks. Three pipes will be used in the fall, instead of one as at present, thus increasing the yield in a like ratio. The indications of this mine are of most flattering character, and the good sized and frequent dividends it affords stamp it as a property of decided value.

BLUE TENT.—Under its present most excellent management this fine property is yielding at a most satisfactory rate. The company has had a long fight with formidable and often unforeseen difficulties; but their path to a great and lasting success now seems clear. A mint of gold will be washed from the old Blue Tent ground in the early future.

VARIOUS MINING ITEMS.—A strike of rich ore is reported in the Pittsburg. The Derbec continues to afford gratifying signs of large mineral wealth. From the shaft, 274 feet deep, drifts are being run in an easterly and westerly direction—the former having progressed 45 feet and the latter ten feet. The bottom of the shaft and both of the drifts are in the richest of gravel. On the Empire work is being pushed with no changes to note. The ledge is still very small all through the mine. The ground in No. 6 drift in the Rich Hill lode is a little more favorable.

INYO.

THE INDEPENDENCE.—*Independent*, June 8: The Independence tunnel and mining company, owning the Potosi series of mines, on the north side of Kearsarge Peak, has begun active operations. A few men have been put to work on the hill building cabins, opening trails, etc., preparatory to regular operations on the tunnel which it is proposed to run. To cut through all the company's own mines requires a tunnel 2,000 feet in length, beyond which are situated the Rex Montis and others. In prosecuting the work, Burleigh drills and all modern means of rapid work will be introduced and matters pushed ahead. When by the melting of the snow such work is practicable, a road will be constructed to the summit and the waters of the lakes thereon turned down the creek to furnish power for the mill, to be erected just below the mouth of the tunnel.

BEVERIDGE DISTRICT.—The new gold mines of this district, just across the Inyos and some 18 miles distant from here, are coming into high note, the outlook being second to none in the county. Parties just in from there confirm our

account given in detail some three weeks since, especially as to the number of ledges and the quantity of rich gold ore in sight. To the north of the Hughes, Porter & Co. mines there is a field known to be rich in gold ledges, and unoccupied, unless a recent Lone Pine party has made locations there. A mill is about to be erected in the district and a road built connecting it with Independence.

KERN.

AT THE BIG BLUE.—*Gazette*, June 8: Everything is going along as usual. At Mineral hill they are busy taking out rock and crushing it at the old Bull Run mill. J. W. Sumner has sold his mine on Mineral hill to D. E. Jones. At Keysville D. E. Lightner is still working away. He says the indications at present are flattering. At Erskine creek the Mitchells are still operating, and Moore, Black & Co. are preparing to build a mill on their lead.

SOLD.—G. P. Cornell has disposed of his interests in the Eclipse and Lee mine near Tail Holt, to a party of San Francisco gentlemen who will run it themselves. They have removed the 10-stamp mill and will use the 5-stamps remaining for crushing rock.

SHASTA.

COPPER CITY.—*Reading Independent*, June 6: W. H. Dunn sent us some fine specimens of ore from the Northern Light mine, at Copper City. They have found a very rich ledge. Superintendent Boylon, of the Donkey mine, reports everything fine in the district. Their ledge is five feet wide on the 200 level, and it improves in richness as they go down. N. A. Peckham has sold his mine, on Whisky creek, to Hull, Bickford, Grotenfend and Stroud, for \$4,000.

IRON, MARBLE AND GOLD.—There are iron and marble mountains near McCloud river, and the Central Pacific will probably secure the last mentioned. Patents for two iron mines have already been taken out of the Shasta Land Office. Dunham & Co.'s hydraulic and drifting mine, Igo, 12 miles from Shasta, 100 acres, has a channel from 400 to 600 feet in width, and pays between \$2.50 and \$5 per cubic yard.

SIERRA.

ORIENTAL.—*Mountain Messenger*, June 8: Work on this claim, situated near Alleghany, is being pushed forward as rapidly as possible and the hoisting of ore has been commenced. It is thought that, in a few days, 15 to 20 tons per day will be brought to the surface. There is now in sight, between the 300 and 400 levels, 16,000 cubic feet of pay ore. By allowing 13 cubic feet to the ton, they now have on hand and in sight, 1,230 tons of ore, and they will have from 500 to 600 tons of that on the dump before July 1st. They are raising on the vein in the main tunnel and in a few days will be to the point where was found the rich quartz.

SAVAGE.—Active work has been commenced on the Savage mine, near Milton, on the ridge above the Pliocene. A Virginia City company owns the ground and will put down a shaft this summer. No one doubts their striking a fine pay channel.

GOLDEN STAR.—On this claim they have developed a channel, or rather two channels, several hundred feet wide, with splendid gravel in each and of indefinite length. The company is working about 35 men, and taking out nearly gold enough to pay expenses at present. They are short of water, which is the only thing that prevents them declaring dividends monthly. A 75 breast of rich gravel was lost, last week, by a cave. Contrary to the opinion of several experts, the mine is now demonstrated to be an extensive one.

PLUMAS.

THE GREEN MOUNTAIN.—*National*, June 8: This mine is showing better and better as the work makes developments. The lower level shows an improvement in the quality of the quartz, which is of first-class importance as it proves the "staying" powers of the mine. The shipment for the month of April was \$9,000.

PLUMAS NATIONAL MINE.—This company are now employing 50 men, and the works and mine are in splendid condition. The upper "stopes" show decidedly well and continue to yield favorably. A new level is being opened, with three shifts of men running day and night. The pay chute of quartz should be reached in a few weeks, and it will probably show an improvement in quality of rock over that above. The mill is running constantly with excellent returns. Soda creek begins to show signs of becoming one of the lively mining camps of Plumas, and another mill or two will probably be put up before fall.

MINING NOTES.—The big pipes are all at work, and the miners busy about La Porte. The present water season is certainly a favorable one, and the miners will make a harvest. The Hungarian company have plenty of water and the pipes are running steadily. The Bell's Bar company are hard at work, and think they will get hedrock in a short time. Through the difficulties that have arisen between the owners of the Franklin, another good mine is doomed to be idle for some time to come, at least, to the detriment of many good square men, who have invested their money with the expectation that it would be a paying enterprise.

SISKIYOU.

MINING ON THE KLAMATH RIVER.—*Yreka Journal*, June 5: Shortly mining on this stream will be lively, with the prospect of much gold being taken out this season. Pacific company, working the bed of the Klamath at mouth of Humbug, are running two drifts, one up the stream and the other towards Humbug creek,

under the river, and have already taken out very good prospects. The Empire quartz mining company are also putting up a new mill, Mr. Hopper having already commenced the wood work with a couple of carpenters assisting, and the iron work is now being hauled to the locality from the foundry in this city. In about another month Schnackenberg and Lewis will have the road completed, so that by the time the mill is completed the company will be ready to haul quartz from the mine for crushing. The Centennial Bar claim owners will be ready for washing pay dirt this week, and expect to realize a rich reward for their perseverance and industry in opening this claim. Other parties further down on the river are also making preparations for a good season, while down at Humburg Bar, more mining will be done than ever before, giving an abundance of work for a large mining population along the river all the way from Humbug to Humburg.

TRINITY.

TRINITY CENTER.—*Journal*, June 8: Never were prospects better in the northern part of this county than at the present time. Farmers have the assurance of a more than ordinary crop and miners are at work with a full supply of water, which will continue a long time yet. Business about the town of Trinity Center is brisk and all Trinity valley is happy and content. The Altoona quicksilver mine is in good shape to make a large and profitable run this season. Owing to the extreme high grade of the ore, the metal can be produced here more cheaply than at any other mine in the State. In so far as they supply the mines in the vicinity, this company have also the cost of transportation in their favor.

DEADWOOD AND INDIAN CREEK.—From the former of these places, mining reports are of the most cheerful kind. The Johnson mine, on Indian creek, is also turning out well; ore rich and profits satisfactory.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, June 12: On the 1950 level the west drift from No. 3 California winze has completed connection with the C. & C. shaft since our last report, giving excellent and much needed ventilation to that portion of the mine. The main south lateral drift on the 1850 level is in hard hasting porphyry, and the timbering of crosscut No. 3 is being pushed forward to completion. On the 1650 level the west crosscut from winze No. 1 continues in fine ore, and the winze being sunk in the west ore body is also still in good ore. The repairs to the main shaft of the mine are being urged forward as fast as unlimited men and means will admit of.

CALIFORNIA.—There are no important changes in any of the ore stopes or hearsts on either the 1600, 1650 or 1750 levels, all are looking well and yielding good ore. On the 1950 level the east drift has connected with the 1950 station of the C. & C. shaft, greatly benefiting the ventilation of all the lower portion of the mine, and enabling a much more rapid advance of the main south drift on that level.

SIERRA NEVADA.—The south drift on the 2000 level has reached the south line of the mine, at which point two crosscuts will now be run, one east and the other west, to prospect the ore vein.

BELCHER.—The main east drift on the 2360 level has reached a point within a short distance of where it was expected to strike the ore vein, and preparations are now being made to start a drift south on the west side of the ore vein.

OVERMAN.—The east drift on the 1600 level is steadily advancing, the face in dry vein porphyry. A drill driven to the westward from the bottom of the shaft to test the character of the ground, struck water, when the drill hole was immediately plugged up and an advance in that direction stopped.

LADY WASHINGTON.—The east and west crosscuts on the 1150 level have reached the east and west walls of the ore vein, which at that point is 170 feet in width, solid and well-defined, carrying small streaks of rich ore.

CALEDONIA.—The north drift on the 1600 level is steadily advancing, the face in fine ledge matter, and the flow of water steady, strong, and gradually increasing.

CON. IMPERIAL.—The east drift from the 2400 station of the joint Alpha winze is advancing, the face in vein matter of a favorable character. The north drift from same station, running in Alpha ground, is in a distance of 80 feet, the face in quartz, clay and porphyry mixed.

JULIA CON.—No. 1 crosscut 100 feet south of the 2000 station is in a distance of 36 feet, the first 20 feet having passed through a mixture of clay and porphyry, and the last 15 feet being a mixture of porphyry and quartz of a lively, healthy look. Crosscut No. 2 was in 34 feet, the entire formation from the start being vein matter of the finest character, streaked with quartz, which has every appearance of forming an unbroken body of ore at almost any moment. The dip of the clay west wall is that of the genuine Comstock, and the stratification and stringers of quartz both show a vastly improved condition of the vein over what it was, even 200 feet farther south on the level above.

SAVAGE.—The east drift on the 2100 level is steadily advancing, and is now in a distance of 100 feet from the station, the face being still in porphyry of a favorable make. The east drift on the 1640 level is being pushed steadily forward, the face still is solid quartz and low

grade ore, showing occasional spots of very rich chloride ore. The quartz and ore penetrated by this drift is now over 100 feet in width, and there is no sign of any east wall. The distance separating the face of this drift from that of the Sutro tunnel advancing from the east, is not far from 120 feet.

OPHIR.—Yesterday members of the press were allowed to visit and reportorially examine the ore development in the winze below the 1900 level, about which such contradictory and undesirable stories have been told of late. Representatives of the *News* and also of the Virginia papers have taken a square look at it, and also took all the samples for assays they saw fit. At the 2000 level a station is opened, and a drift west commenced to connect with the main drift on the 2000 level, which is coming east from the main incline to connect with this winze. About 20 feet remains to be drifted in order to complete this connection. With the exception of the first 18 feet, the winze aforesaid has been continuously in ore with a partial interruption from porphyry at one or two points, and the station at the bottom, which is not yet timbered, shows a width of 19 feet of excellent milling ore with the probability of several feet more. The average assays of this ore are very good, running from \$50 to \$300 and upwards to the ton.

YELLOW JACKET.—The north winze below the 2200 level is down 371 feet on the slope of the ledge, and 30 feet more will carry it to the 2400 level. The new shaft is down 1501 feet, bottom in hard, dry porphyry.

SILVER HILL.—The south lateral drift on the 800 level is steadily advancing, the face in very favorable quartz.

JUSTICE.—The prospecting drifts east and south on the 1300 level continue to show well, and promise the development of considerable bodies of good ore when everything is ready for its extraction.

GOULD & CURRY.—Sinking the main incline is being pressed ahead with all the force possible, the air at the bottom being very hot and the rate of progress thereby much impeded.

ALTA.—The north and east prospecting drifts on the 1350 level are being pushed rapidly ahead, a large portion of the vein being laid bare ready for crosscutting and the extraction of ore for milling, whenever it is desirable to do so.

BULLION.—The north drift on the 2000 level is steadily advancing, the face in hard, dry porphyry and clay mixed, with streaks and spots of favorable quartz. The east drift on the 1840 level is also advancing, the face in favorable vein material.

MEXICAN.—The joint east crosscut on the north line, on the 1600 level, is being steadily advanced at the rate of three feet per day.

CROWN POINT.—The south drift on the 2300 level, running to connect with the north drift from the 2360 station of the Belcher drain shaft, is being pushed ahead with extraordinary vigor, having advanced 56 feet last week, or at the rate of eight feet per day.

UNION CON.—The joint east crosscut on the south line of the mine is advancing rapidly, the face in hasting porphyry.

HALE & NORCROSS.—The pumps, working in conjunction with those of the Savage, are steadily gaining on the water, which is now down 50 feet below the 2100 station.

CHOLLAR-COMBINATION SHAFT.—Sinking the Combination shaft is going ahead at the rate of three feet per day, the rock in the bottom blasting out quite hard and the flow of water being still about 42,000 gallons per day.

SUTRO TUNNEL.—Total length of tunnel, 19,847 feet. Face of header in dry, hard ledge matter, principally porphyry, with streaks of quartz.

LEVIATHAN.—The face of the main drift east on the 765 level is in a mixture of porphyry and quartz, and the ore vein is evidently not far away.

BELMONT DISTRICT.

MINES ABOUT TOWN.—*Courier*, June 8: Work continues to be actively pushed on the series of mines in this district and with steady improved prospects. The machinery is in good order and running smoothly, and ore extraction may be expected to begin in good earnest before long.

THE GILA MINE.—The stopes are looking remarkably well and turning out very good ore in larger quantities and of a better grade than ever before. The mill, until yesterday, has been running on custom rock; commenced on Gila ore, and from this time the mill will run steadily upon it, having now at the mill nearly 400 tons, with a large quantity on the dumps and the stopes looking well, with the promise of a large quantity yet to take out. Bullion shipments for May, \$7,266.40.

WESTERN NYE.—Concerning the mines in the western part of Nye county, we receive the following information: The Alexander company, at Grantsville, will soon commence erecting their new mill, which, when started up, will materially reduce the cost of turning the ore into bullion. At present the expense of hauling ore to the mills at Ellsworth and Ione considerably lessens the profits. The company is running a chute to connect the upper and lower tunnels. As soon as the connection is made they will have better air in the mine, which will, of course, increase their facility for the extraction of ore in sight.

DOWNIEVILLE.—Work in the mine of the Downie Bros. is being pushed vigorously along. They are taking out large quantities of rich ore and there are several hundred tons on the dumps, waiting the firing up of the furnaces.

These mines are looking splendid and seem to be one vast body of ore. The furnaces are nearing completion and will soon be adding its quota of bullion to the output of Nye.

ELLSWORTH.—This mill is shut down for repairs. It will start up on ore from the Alexander as soon as things are in running shape again.

LODI.—The mines are producing quantities of rich ore, which keeps the furnace steadily going.

IOSE.—The town is quiet. The mill is running on ore from the mines at Graustville.

CHERRY CREEK DISTRICT.

STAR MINE.—*Independent*, June 8: The shaft on this mine is now down 115 feet below the 360 level. Drifting on the 460 level will commence immediately. The usual number of men are employed on the mine, and sufficient ore is being taken out to run the mill. During the past month the Star company has disbursed the sum of \$25,000, including \$11,000 for labor at this mine and mill.

THE MARY ANN.—Work here has been temporarily suspended. The contract made in February last, whereby certain portions of the Mary Ann mine were to be prospected on the condition of the man receiving their board, whether ore was discovered or not, but \$4 per day in addition thereto in case ore was discovered, expired on the 18th ult. The body of ore in sight is now more promising than at any time heretofore. The only reason the return from the ore crushed at the Geneva mill was but \$47.33 to the ton was from a want of being properly sorted.

EUREKA DISTRICT.

MINING NOTES.—*Sentinel*, June 8: From 12 to 20 carloads of crude bullion, worth from \$16,000 to \$30,000, are shipped from Eureka daily. The Atchinson Union mine, recently discovered, is pronounced to be a continuation of the McCoy hill vein. The croppings are wonderfully rich, assays running into the thousands. The Williamsburg shaft is down 150 feet, and the bottom is in ore. Considerable sorted rock is being engaged for shipment by Salt Lake buyers. The bottom of the winze at the Bald Eagle is in clay and ledge matter intermixed with streaks of oxide of iron, and there is every indication of the proximity of a large ore body. Considerable ore is being shipped from the Barton mine to the Richmond reduction works. The bottom of the winze from the lower level of the Bald Eagle is in clay and ledge matter, with all indications favoring an ore development close by. The force at the Kit Carson are doing some good work, straightening up the shaft, and getting the property in shape for future operations. An upraise above the 250 level some 80 feet from that point, in the Hamburg, has developed a handsome body of gray carbonate ore, rich in silver, and carrying from 50% to 60% lead. About 1,000 tons of ore have been broken down at the Geddes and Bertrand mine. It will run from \$100 to \$150 per ton.

JEFFERSON DISTRICT.

STARTING UP.—*Reveille*, June 7: The commencing of work on the Jefferson mine has tended to reanimate this old, and, for a long time, sluggish locality. When it became known that operations were to be resumed, many men applied for work, there having been but little for them to do for many months past. Jefferson has good mines, which were turning out much bullion a year or two ago, and it would be gratifying to see this state of affairs prevailing there once more.

LEWIS DISTRICT.

ORE STRIKE.—*Silver State*, June 8: A very important strike has been made in the Arthur mine in Lewis district. At a level started in the shaft at a depth of 85 feet from the surface, they have cut six feet into the ledge without any appearance of getting through it. This distance is in solid ore, which assays high in silver. We saw a specimen of the ore, in which there is a beautiful net work of antimonial silver wire, and for which specimen collectors offered \$20 at sight. The Arthur mine was discovered last winter, and is owned by Tom Ryan, the discoverer, Aleck Middleton and others. The Star and Grove mill is a success. The ores are worked up to 92% of their assay value.

SULPHUR AND CINNEBAR.—It is reported that cinnebar, containing a high percentage of quicksilver, has been found in the San Francisco Sulphur Company's mines at Rahhit Hole, and that the prospects are favorable for extensive deposits of the ore being found. We believe it is not unusual to find sulphur and cinnebar in the same locality.

OSCEOLA DISTRICT.

PROSPECTS.—*Independent*: The news from the gold fields of Osceola gives encouraging accounts of recent rich strikes of quartz in that district, and a big camp is likely to spring up out there during the coming season.

WARD DISTRICT.

BULLION SHIPMENTS.—*Ward Reflex*: The bullion shipments made from Ward for May do not come up to the estimates made at the first of the month, but two shipments being made—May 10th, \$10,400, and May 20th, \$11,822, making a total of \$22,222. Another shipment will perhaps be made in a day or two equal in amount to either of the shipments already made, which should be credited the month. This falling off is doubtless owing to the milling character of the ore put through the furnaces.

WHITE PINE DISTRICT.

THE KING'S COMPANY'S FURNACE.—*News*,

June 8: This furnace, which was to have started up this week, has been delayed, waiting the arrival of water tanks from below. In the meantime, Mr. Lyman is accumulating quite a supply of ore from the various mines around White Pine mountain, which will enable the furnace to make a profitable run. We understand that Mr. Thomas, the smelter, anticipates no serious trouble on account of the water supply from the wells, but to prevent failure from such a contingency, all the arrangements will be ready to commence hauling from the California mills as soon as any perceptible diminution becomes apparent at the wells. Tuesday or Wednesday next the furnace will be fired up.

EXPERIMENTING.—The Gamble Bros., of Salt Lake, who arrived here a few weeks ago, are conducting an experimental leaching process on Treasure hill, with a view of utilizing the low-grade ores there. So far they seem to be satisfied and encouraged by the results attained. About two weeks more will demonstrate to their entire satisfaction whether the ores will yield a profitable return by the leaching process.

MONTE CRISTO.—We learn that the efforts which owners of valuable mining property at Monte Cristo have for some time been exerting to induce capital to take hold of these properties is likely to soon meet with success. An English company, having the development of a group of mines around Monte Cristo in view, is being organized, and its intention is to commence operations at no distant day.

Arizona.

MINING ITEMS.—*Citizen*, May 8: A rich body of ore has been struck in the Vulture mine, and the 10-stamp mill is shipping \$4,000 worth of gold every week. Ore in considerable quantity worth \$800 per ton has been cut into in the lower tunnel of the Tiptop mine. Milner and Watson are taking out very rich ore from their mine on Mineral hill. The Tiger mine, Bradshaw district, is looking remarkably well, fully 15 feet of pay ore in the north drift. C. B. Genung has arrived with the hoisting machinery, blower, etc. Rumor says that a mill will soon be on the ground. A great many people in Tiger and Pine Grove Districts are working ledges and prospecting. Lynx Creek district, one of the oldest and best in the mountains, will, it is thought, shortly put on brisk mining airs. There is talk of a mill and other improvements. The Peck, Tiptop, Poy and other producing mines are in fine condition for yielding ore. A large and constant supply of bullion is coming from these mines.

Colorado.

LEADVILLE.—*Denver Tribune*, June 11: The Long & Derry mine near this place is likely to prove a very good property. It is already thoroughly opened and is being actively worked, having yielded about \$75,000 worth of ore. Some of the ore has milled as much as 700 ounces of silver per ton.

LAKE CITY.—We have another good excitement, this time Arizona is the long looked for El Dorado. A certain party has been here for a number of days and has been telling some marvelous tales of his adventures in that Territory, and of finding \$3,000 per day diggings to the man. He has created quite an excitement among a certain class, who are preparing to leave for the field of action or hack action by the first of the month. He states that he was there 10 years ago, and the question is, why has he not said something about it before? Gold may be there, but it does not seem hardly possible that he would have remained quiet these years, and now endeavor to raise a company.

CENTRAL GULCH.—The Longfellow mine at this place is shipping about six tons per month of ore which nets \$200 to \$300 per ton. The shaft is 80 feet deep, and at the end of the cross-cut tunnel, run in a distance of 65 feet, the vein has been cut and a drift run 50 feet west thereon. Drifts are also being driven to the east and west from the shaft, and stopping will soon be commenced, when the output will be materially increased. As far as opened up the showing of the mine has been unusually fine.

Utah.

BINOHAM HIGHLAND.—*Salt Lake Tribune*, June 9: Though the lead market still presents an unfavorable aspect, it does not appear to have a depressing influence upon the shipments of ore, judging from the quantity that daily leaves this section. The owners of the principal mines evince an unwillingness to operate by hiring and find it more advantageous, pecuniarily, to sub-let. The majority of the mines now being worked are on lease, and considerable ore is being extracted. There are about 40 different claims being actively worked in this section, the most of them on lease, from four or five to 20 or 30 men being employed on each claim. Gold, silver and lead are all produced here, some of the ore being very rich in each of the metals. The most of the miners who worked under leases are doing well. Some making large wages.

FRISCO DISTRICT.—Ground has been broken for the new hoisting works of the Great Horn silver mine. A new working shaft is already started and has attained a depth of 20 feet. It will be sunk to the ore body as fast as circumstances will permit. The ore body in the mine is immensely rich. Both smelters are running and making two car lots of bullion per day. The company will bore an artesian well here, for water is getting scarce. The Frisco reduction works are pushing ahead their new improvements as fast as possible, and will soon be

ready to run out lots of silver bricks. Wm. Raht is superintending the construction of the roasting chloridizing ovens. One of them is now finished. Mr. S. Carlisle is completing this great roasting furnace for Messrs. Godbe & Co. He has also been doing the fire rock work for the Bonanza company. We have the best fire rock in the United States. The lining in Godbe stack has stood the blast for over 60 days. The smelter at Shautie is running and cleaning up little job lots of ore, but the bulk of the ore in Star district is being shipped to Frisco to be reduced.

News in Brief.

A LARGE number of hogs are dying near Reno from some unknown cause.

EMIGRATION on a large scale has lately commenced from Lorraine to France.

THE Wood tariff bill has met with final defeat in the House of Representatives.

GRAIN is worth six cents per pound in Prescott, Arizona, just now, and scarce at that.

THE opinion prevails in Manchester, England, that this cotton strike will be ended this week.

THE coinage of the Carson Mint for the last month was \$701,000 in standard silver dollars.

JOHN KYLE was thrown from a horse at Petaluma, Cal., last week, and received fatal injuries.

ON June 6th four unknown men in a boat went over the Cascades in Oregon and were drowned.

SOME fields near Healdsburg, Cal., that were thought to be of cheat, are now developing into wheat.

SNOW to the depth of five feet fell a few days since at San Geronio pass, San Bernardino county, Cal.

ARTIFICIAL ice sells in New Orleans for \$10 per ton, and Northern ice has been driven out of the market.

A SON of Brigham Young has gone to West Point, to be educated at the Government's expense, making the third thus honored in the past six years.

LOS ANGELES county, California, figures on 1,500,000 pounds of wool this season, half of last year's clip.

L. J. ROSE, of San Gabriel valley, Los Angeles county, has paid a tax of \$30,000 on brandy during the past year.

NEARLY 300,000 bushels of grain will be cut in Honey Lake valley this year, the most of it raised on sage land.

SIX members of a family named Rogers, living in Austin, Nev., were poisoned last Monday by eating canned salmon.

B. R. PRINCE, of Altaville, Calaveras county, has a coccoony in successful operation, with about 500,000 silkworms.

AMERICA has sent over 400 missionaries to Turkey and spent \$5,000,000 in efforts to convert the Turks to Christianity.

It is asserted that Germany has invited the Powers to consider necessary measures for checking conspirators located abroad.

THE trial of the Chinaman Wong Chu Shut, just convicted of killing a countryman, cost the county of Los Angeles \$2,500.

AT Bayou Sara (La.) on the 7th inst. six negroes were seized by the mob and hung for attempting to kill Dr. Wm. Archer.

A DECREE has been issued at Berlin proclaiming the Regency and nominating Crown Prince Frederick William as Regent of Germany.

It is reported that a company will soon commence building a narrow-gauge railroad from the town of Sonoma to deep water on the creek.

ON the 7th inst. an explosion took place at Evans' wood-pit colliery, at Haydock, six miles south of Wigam, in Lancashire, Eng., killing 280 men.

HON. JOHN SCOTT HARRISON, of North Bend, Ohio, son of President Harrison and father of General Benjamin Harrison, recently died, aged 73 years.

It stormed every day last week at Susanville, Lassen county. Three times during the week the mountains surrounding the town were covered with snow.

JOHN C. FREMONT, Jr., son of Gen. Fremont and an Ensign in the Navy, clandestinely married a Miss Anderson, in Washington, before his departure for Europe.

REV. KNOWLES SHAW, the evangelist, was recently killed by the ditching of a train in Texas. Five other persons were seriously, and 12 painfully, wounded.

A DISPATCH from London says: Lancashire cotton mill owners are arranging to bring operatives from the United States, in view of the continued lock-out.

THE wine-making industry in California has thus progressed: In 1859, 500,000 gallons were made; in 1869, 1,000,000; in 1872, 3,000,000; in 1875, 7,000,000; in 1876, 10,000,000; in 1877, 8,000,000.

TOM MAGUIRE, theatrical manager, has engaged Henry Ward Beecher to deliver ten lectures on the Pacific coast in the fall, Beecher to receive \$10,000 for the course and an additional \$1,000 for expenses.

DR. DIO LEWIS and 12 of his party are camping at the foot of the hills near Calistoga. They will probably remain in the valley two weeks or more, and then move toward Lake county, where they intend to remain during the warmest weather of the summer.

THE laborers on trike in Quebec parade the streets and refuse to allow men to work on the street railway or on the public works under \$1 per day. Some of the contractors have given way to the demands of the men.

THERE is no immediate prospect of a cessation of the distress in China. Large quantities of grain are being conveyed into the famins districts.

MILLIONS of grasshoppers are threatening destruction to the crops in Sierra valley. Before hatching their eggs were an inch thick, and though the late storm killed millions of them tens of millions remain.

ELECTION returns from Oregon indicate that the Democrats will have a majority in this Legislature, thus insuring the election of a Democratic United States Senator. The Republicans elect the Governor and a majority of the State officers.

EVIDENCES of a Socialistic plot to murder the Imperial family of Germany, as well as Prince Bismarck, continues to accumulate. The most intense excitement exists throughout Germany, and the police have made many arrests of suspicious persons.

THE stallion "Specter," owned by Colonel Dorsey of Stanislaus, California, was killed a few days ago. He got loose from his stall and went among a herd of horses, when one of them kicked him over the eye, breaking his skull and killing him instantly.

THE Chicago Board of Trade has passed a resolution memorializing Congress to provide for the increase of this army to 100 regiments of 1,000 men each, "to the end that all parts of our country may be protected against the emergency likely to arise of complications from without or of demonstrations of violence within our own country."

EMPEROR WILLIAM continues to improve. His would-be assassin, Dr. Nobeling, still remains in an unconscious condition. A brother of Nobeling, an officer in the army, has been arrested. Bismarck is very nervous over the situation. The German Government has been anonymously informed that if Dr. Nobeling is harshly dealt with every sovereign in Europe will be assassinated.

PORTER ROCKWELL, under indictment for the murder of Aiken and others, parties from California in the year 1857, died suddenly last week at Salt Lake City. He was about 60 years of age, and was to have been tried next September. It is believed that he was poisoned at the instigation of prominent Mormons who were fearful that he would through his confessions implicate them in the commission of numerous crimes.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

CON. DORADO M. Co.—June 5th. Capital stock, \$10,000,000. Directors—John McDougall, Chas. A. Harris, C. H. Sillman, John Willenshurst and Philip Corcoran.

NEW HOPE M. M. & D. Co.—June 6th. Capital stock, \$400,000. Directors—Wm. M. Stewart, James Morgan, J. R. Hardenbergh, S. B. Hardenbergh and O. F. Wiley.

ST. LOUIS G. & S. M. Co.—June 6th. Capital stock, \$10,000,000. Directors—C. Benedict, John D. Graham, John Haynes, W. G. Graham and E. S. Irwin.

BUSHNELL G. & S. M. Co.—June 6th. Capital stock, \$10,000,000. Directors—C. Benedict, John D. Graham, John Haynes, W. C. Graham and E. S. Irwin.

MUSICAL BOXES.—The roar of the great May musical festival will not drown the sweet melody which is poured forth by the musical caskets of M. Paillard & Co., 120 Sutter street. These little gems of harmony, made by a branch of the firm in Switzerland, and sold in San Francisco by the makers, are unequalled in their construction and performances. They are elegant articles for presents to friends, and they are charms to possess for oneself. They amuse by their wonderful power, and they soothe and instruct by the faultless execution of the finest musical airs. The excellence of the instruments is sufficiently attested by the high awards which have been made to them by world's fairs and local exhibitions, and they commend themselves to all who come within the sound of their trills and cadences. M. Paillard's establishment at 120 Sutter street, should be visited by all who come to see the sights of the city.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Modoc, June 8th, \$8,876.65; Tyho Con., June 7th, \$4,141.34; Northern Belle, June 8th, \$4,516.40; Standard, June 9th, \$33,397.10; Christy, June 10th, \$4,899; Tyho Con., June 5th, \$8,112.93; Hackberry, June 10th, \$12,000; Independence, June 10th, \$18,000; Northern Belle, June 5th, \$4,661.21; Modoc, June 2d, \$10,189.51; Justice, June 7th, \$11,700; Raymond & Ely, June 13th, \$4,787.97; Modoc, June 3d, \$3,845.39; Northern Belle, June 3d, \$4,858.08; Tyho Con., June 1st, \$3,994.42; Manhattan, June 12th, \$14,500.

LAND, SCRIP AND WARRANTS.—An advertisement in another column describes the business of D. H. Talbot, land, scrip and warrant broker, at Sioux City, Iowa. The attention of those needing the services of a broker in these properties or claims may find his announcement of advantage to them.

JOHN C. FREMONT has been appointed Governor of Arizona by the President.

The Bread-Fruit.

The bread-fruit tree, an important tree of the order *Artocarpaceae*, is a native of Southern Asia, of the South Pacific and of the Indian archipelago, and is now naturalized in some of the West Indies with some success. In the South Pacific it grows in the Sandwich islands, the Marquesas, the Society, the Samoas, the Fijis, the New Hebrides, and, in fact, in most of the larger tropical islands, where it delights in rich, moist, sheltered situations. It attains a height of from 50 to 60 feet, and measures about six feet in circumference at the base. The leaves are glossy, dark-green, which are pinatifid, or deeply divided into gracefully pointed lobes or scollops, like those of a lady's lace collar, and from 6 to 12 inches in width, and from 12 to 18 inches in length. As they are deciduous, and as they fade they almost rival the prismatic colors of the rainbow.

The greenish and inconspicuous, unisexual flowers are borne crowded on aments or catkins, the staminate ones being club-shaped, while the pistillate ones resemble the balls of the sycamore; both on the same branch.

The fruit, which is a *sorosis*, is nearly spherical, and somewhat resembles in magnitude and general appearance one of our citron melons of ordinary size, and sometimes weighs four pounds or more, but, unlike the melon, is not ribbed longitudinally; its surface is marked with a network of small hexagonal divisions, having each a small prominence in the middle. It greatly resembles, on a larger scale, the fruit of the osage orange, to which tree, as well as the mulberry, it is closely related, botanically.

The refreshing green of its rich foliage, the large and singular-looking fruits that hang from its branches, together with the pleasant shade

the remaining part placed in a sort of shallow wooden dish and briskly worked with a stone pestle or pounder; with the addition of a large quantity of rich cocoanut milk, this is the great staple of food; it somewhat resembles in its consistency our book-binders' paste, and is known as "poi poi," although "poi poi" is often made of taro and other esculent roots. The native way of eating this is by thrusting the two forefingers of the right hand into the mass, which is generally kept in a large wooden bowl, and, securing as much as will adhere to the fingers, passing it into the mouth with rapid evolutions. Besides these there are a great many other ways of preparing this valuable food.

Formerly one method of preparing the bread-fruit was as follows: The population of a district would assemble and form a large common oven, by digging a pit from 10 to 15 feet in diameter and from 8 to 12 feet deep, and filling it with firewood till the heat becomes very great. The covering is then removed, and many hundreds of ripe bread-fruit thrown in with leaves laid over them, and the remaining hot stones were placed above them, and the whole covered with leaves and earth. Thus they were left for a certain length of time before being opened. This wholesale mode of baking the fruit has, however, been much discontinued since the introduc-

Product of the Eureka District.

During the month of May, crude bullion was shipped from Eureka district valued at \$726,500. In the same period the Richmond company forwarded fine dore bars aggregating \$211,300. This was the product of the refinery. The output of the furnaces exceeded that sum by \$80,000. The value of the lead sent forward is estimated at \$210,000, and the ore and flue dust shipments will add \$20,000 more, making a grand total of nearly \$1,247,500. This is an increase over the month of April of nearly \$100,000, and at the present writing is safe to predict that we will swell these figures still more this month. We base our calculations on the fact that the Eureka Con. has built one more furnace, which will add one-fifth to the bullion-producing capacity of its reduction works. The Hamburg will start a furnace about the

15th, at which time the K K will resume smelting their own ores. This, we take it, is a very handsomeshowing, and one that we may be justly proud of. The mineral belt comprised within the boundaries of the district is the richest on the face of the earth, and in the profusion of its wealth is without a rival. The lode, prospected to a depth of 1,000 feet, develops as large deposits as were

THE ENGINEER.

RAPID TRANSIT ON THE ERIE CANAL.—*Scribner's Monthly* on efforts to secure faster and cheaper passage of boats: As to the future usefulness of the canal, the first question to be asked is in relation to the moving power used for transportation. Whether the late improvements in the power used will enable the canal to compare favorably with the rail as to the actual cost of moving freight. Many plans for quick and economical transit have been submitted to those persons designated by the State to examine them, embracing the use of steam, water-power, towing by endless cables, etc. The plan of coupling two boats together, with the steam power applied only to one boat, which pushes the other ahead, shows a great saving of labor and fuel. The coupling is so ingeniously arranged that it is a very simple matter to uncouple the boats in order to allow them to pass through the locks separately. The expense of moving them, as seen by a statement submitted, is \$602.58 for making the entire trip from New York to Buffalo and return, with an average load of 315 tons; and in this expense are included tolls, fuel, oil, depreciation of and interest on property, labor, insurance and sundry expenses, etc. The time consumed is 19 days. This comprises a distance of about 1,000 miles, over which 315 tons of freight have been moved at an expense of \$602.58, which is a little less than two mills per ton per mile. A comparison of the old method of towing by horses shows a saving of time of at least five days, while the capacity is twice as great, and the actual cost is only one-quarter as much. It has been mentioned by excellent authority, that for 47 years the actual cost of transportation of freight by canal where horse-power has been used, aver-

FRUIT AND LEAF OF THE BREAD FRUIT—REDUCED FROM NATURAL SIZE.

it affords, all combine to render the bread-fruit one of the most attractive trees to those who visit Polynesia.

The bread-fruit contains a large portion of starch or fecular, and forms one of the principal articles of diet amongst the islanders of tropical Polynesia. The natives are remarkably fond of it and it appears to be very wholesome and nourishing. There are numerous varieties of this noble tree, all of which have distinct native names.

The pulp is juicy and light-yellow, when it is fully ripe, but it is in a better condition for eating before it arrives at that stage of maturity. The rind is perhaps an eighth of an inch in thickness; and denuded of this, at the time when it is in the greatest perfection, the fruit presents a beautiful globe of lightish-yellow pulp, the whole of which may be eaten, with the exception of a small core, which is easily removed. However, it is never used, and indeed, altogether unfit to be eaten until cooked in some way. The most simple mode consists of placing any number of the freshly-plucked fruit, when in a particular state of greenness, among the embers of a fire, in the same way that you roast a potato, and sometimes among heated stones. After the lapse of 10 or 20 minutes the green rind embrowns and cracks, and when it is removed it has the appearance of "a beautiful light-colored smoking loaf." Thus eaten it has a mild and pleasant flavor. There is one other form, however, in which the fruit is generally served that renders it a very pleasant dish. As soon as it is taken from the fire, the exterior is removed, the core extracted and

tion of Christianity into the islands, in consequence of the feasting, debauchery, rioting and kava drinking that invariably follows the opening of one of these ovens.

This invaluable tree, besides producing two or three regular crops annually, yields a fine resin, which the natives use to render the seams of their canoes and boats water-tight. The leaves they sometimes use for thatching their houses and other purposes, and the inner bark of the young branches for making a common variety of tappa or native cloth. The timber, which is light, and of a rich yellow color, is used for posts of houses, making canoes, and many other useful purposes.

We are indebted to Mr. C. D. Voy, of Oakland, who has studied the fruit in its habitats, for the materials from which to make our illustrations and descriptions.

COAL FIELDS IN PERU.—A coal bed of unknown extent has been discovered at Chala Alta, near Oluzco, in the Department of Libertad, Peru. The government sent a scientific commission to examine the deposit, and has received a highly favorable report. The Chala coal field will, it is estimated, suffice to supply the requirements of the whole of South America, and the quality and cheapness of the coal will enable it to drive the English coal from these markets. The average consumption of coal on the coast of Peru is estimated 200,000 tons per annum, which at the rate of 22 sales per ton gives a total of 4,400,000 sales, at present paid to England for fuel, and which Peru hopes to save by utilizing her newly-discovered fields.

found on the surface, and the lowest point now reached is in an ore body that promises from present indications to exceed in dimensions and value anything ever found on the vein. The Richmond and Eureka Con. ore bodies, as prospecting continues, show no signs of diminution, and the reserves are larger than they were at the beginning of the year. The K K Con is about to develop the deposit found between the sixth and seventh levels, a bonanza of high grade and large proportions. The Jackson has struck rich ore on the third level, and the mine never looked better. The same may be said of the Connolly. The Hamburg has 6,000 tons of ore in sight, with a prospect of increasing that amount indefinitely. The other properties, both on and outside of the lode, are looking and yielding well, and, taking it all in all, the outlook was never brighter than at the present time.—*Eureka Sentinel*.

The *Utica Republican* talks thus about postal absurdities: There are some very queer things about our postoffice regulations. Take the postal card, for instance. If a man has a steady hand and writes close, he may put several hundred words on a card and send it for a cent. If he pastes the least strip of printed matter on it the postage is increased to six cents, though he may print on it the same matter, and by putting it in small type get several thousand words on the card, and it will go for one cent; and he may paste the card all over with printed matter, then put it in an open envelope, and it will go for one cent.

aged a trifle over eight mills per ton per mile. It is hardly probable that the rail can bring it down to six.

AN INDIAN BRIDGE.—At a recent meeting of the English Institution of Civil Engineers, a description was given of the Alexandra bridge on the Punjab Northern railway in East India. The Alexandra bridge was 9,300 feet long and 100 feet deep. The first brick was laid on the 1st of November, 1871. The first train crossed the bridge on the 23d of December, 1875; and it was opened on the 27th of January, 1876. The first design for the bridge was that it should consist of single well piers, 12½ feet in external diameter, sunk 40 feet, and carrying lattice girders under the rails, 97½ feet in length from center to center of the piers. But the high floods of the rainy season of 1871 led to the adoption of Power's three-well system, and to the wells being sunk 70 feet. The piers were 35 feet long, 8 feet 8 inches thick, with semicircular ends, standing on similar basements 38 feet long, supported on diminishing arches between the wells. Three were to be sunk 6 inches apart. The abutments were on 15 wells, sunk to the same depth as the piers, and in two rows parallel to the central line. This change increased the quantity of brickwork originally proposed 5 or 6 times. At the close of the rainy season of 1871 the curbs of several of the piers were pitched. It was then determined to adopt Warren girders, and to have the rail level at the bottom; also to have 64 spans, 142 feet from center to center, and the bridge was thus commenced. The bridge

over the Pulkoo back channel consisted of 9 spans, 43½ feet from center to center, with piers of single well cylinders sunk into the clay substratum underlying the river bed. The girders were of plate iron, carrying the rails on the top.

COLORADO PROJECTS.—The special correspondent of the *Chicago Tribune* writes from Denver, Col., as follows: From present appearances, there will be more miles of railroad built in Colorado, this year, than in any other State west of the Missouri. The Denver and Rio Grande narrow-gauge road has been stretching out by sections, until it now has in operation 296 miles of track, and the extension to Alamosa, on the Rio Grande, now under way, will add 32 miles more. The latter point will be reached within 60 days, and by that time the company will reveal their plans, and the construction force either be put to work on the extension to Chihuahua, in New Mexico, or direct to Del Norte and the San Juan mines. In either event, from 100 to 150 miles of new road will be put in operation during the present year. It is hardly possible that the late active and almost bloody contest for the possession of the Grand canyon of the Arkansas, between the Denver and Rio Grande company and the Atchison, Topeka and Santa Fe, for the present "off," by both parties withdrawing, under an injunction from the courts, may, if decided in favor of the former company, lead to the immediate extension of their Arkansas river branch from Canyon City to Leadville, the new silver lead, El Dorado, over which there is so much excitement. Should the Atchison, Topeka and Santa Fe company win the right of way through the canyon, it is their intention to build a broad-gauge road from Pueblo alongside the Denver and Rio Grande track to Canyon City, and thence to Leadville and Ouray, in the San Juan country, surveys for which have already been made.

THE NEW CLYDE DOCKS.—The new docks constructed on the Clyde show the extensive scale on which this kind of engineering is now carried on, and the adaptation of modern scientific principles and methods to the most complete achievements in the line. The cost of one of these docks is stated to be \$8,000,000, and when entirely finished, the water surface will extend to 34 acres, the length being some 3,000 feet, and the breadth 700 feet, with a water depth of 20 feet. Access to the basin, which is a tidal one, is obtained at the southwest extremity, the passage being 180 feet in width. On the north side, the wall of the quay is founded to the depth of 41 feet below the level of the quays; a central quay passes from the eastern end, parallel with the north and south side walls, separated from them by waterways for a distance of 270 feet, with a uniform breadth of nearly 200. The water space between the western end of this quay and the west wall of the dock forms a sailing ground, and is of such dimensions as to permit of the largest vessels being moved and turned about with every freedom. A strong iron bridge on the swing principle is placed at the entrance to the dock, and, although it weighs 800 tons, is 181 feet long and 40 feet broad, can be moved from one side to the other in a minute and a half. The bridge is worked by hydraulic power supplied from an engine house in the vicinity.

RAILROADS IN WASHINGTON TERRITORY.—The *Seattle (Wash. Ter.) Pacific Tribune* gives the following statement of railroad mileage in the Territory: Washington Territory contains six pieces of railroad, the aggregate length of which is 194 miles. The oldest and shortest of these pieces is six miles in length, around the lower Cascades of the Columbia, and was built and is owned by the Oregon Steam Navigation Company. The next piece is that section of the Northern Pacific between Kalama and Tacoma, 105 miles, which, with a 31-mile section from Tacoma to Wilkeson, built last year, and the lower Cascades road, comprises all that we now possess of standard gauge. The Walla Walla & Columbia River railroad, connecting the town of Walla Walla and Wallula, is of narrow-gauge and 31 miles in length, and the Seattle & Walla Walla railroad, running from Seattle to Talbot, Renton and Newcastle, is also of narrow-gauge, and is 21 miles in length. The only road now building in the Territory is the Thurston County, from Olympia to Tenino, a narrow-gauge and 15 miles in length. The Union and Northern Pacific companies, and the Walla Walla and Seattle companies are looking forward to great extensions during the year ensuing, and it is but a reasonable prediction to make that our railroad system will surely be doubled before January 1st, 1880.

GREAT PYRAMID OF EGYPT.—An English architect, Mr. Tite, has been "figuring up" the cost of the great pyramid near Gizet. Its original dimensions at the base were 764 square feet, and it has a perpendicular height of 450 feet, covering four acres, one road, 22 perches of ground. It consumed 89,025,000 cubic feet of stone; and Mr. Tite adds that it could not now be built for less than £30,000,000 sterling. The joints of the large casing blocks of granite were so fine as to be scarcely perceptible, not thicker than paper; and the mortar was so adhesive that the stones in some cases broke through their substance rather than give way at their jointing. The cost, therefore, of this structure, reduced to Federal currency, was \$145,200,000, a sum large enough to build and put in running order six good, substantial railroads between New York on the Atlantic and San Francisco on the Pacific.

USEFUL INFORMATION.

Petroleum Oils as Lubricators.

Those who are developing our petroleum resources in the southern counties will be interested to learn the estimation in which these oils are held. Oils from petroleum, says *Seward's Coal Trade Journal*, are now produced suitable for nearly every mechanical process for which animal oils have heretofore been used, not excepting those intended for cylinder purposes. A serious objection attaching to the animal oils is present in petroleum. If, through the exhaust steam, some of the oil be carried into the boiler, foaming or priming is the consequence, but the same thing happening in the case of petroleum is rather a benefit than otherwise, for it not only does not cause foaming, but it prevents incrustation or adhesion of the scale or deposit, and this aids in the preservation of the boiler, and is perhaps the best preventive of the many everywhere suggested.

Often, in removing the cylinder-head and plate covering the valves of an engine, we see evidences of corrosion or action on the surfaces, differing entirely from ordinary wear, and the engineer is generally at a loss how to account for it. According to the general impression, grease or animal oil is the preservative of the metal, and is the last thing suspected of being the cause of its general disintegration. The reason of this is that vegetable and animal oils consists of fatty acids, such as stearic, margaric, oleic, etc. They are combined with glycerine as a base, and, under ordinary conditions, are neutral to metals generally, and on being applied they keep them from rusting by shielding them from the action of air and moisture. But in the course of time the influence of the air causes decomposition and oxidation, the oils become rancid as it is called, which is acid, and they act on the metals. What happens at the ordinary temperature slowly, goes on rapidly in the steam cylinder, where a new condition is reached. The oils are subjected to the heat of high-pressure steam, which dissociates or frees these acids from their base, and, in this condition, they attack the metal and hence destroy it.

This applies as well to vegetable as to oils of animal origin, fish or sperm oil included. Petroleum and oils derived therefrom (generally called mineral oils), are entirely free from this objection. Petroleum contains no oxygen, and hence it cannot form an acid, and therefore cannot attack metal. It is entirely neutral, and so bland that it may be and is used medicinally as a dressing to wounds and badly abraded surfaces where cerates of ordinary dressing would give pain.

FIRE GILDING.—A method of reproducing the famous, because rare, fire-gilded glass of the Egyptians has been recently patented, and from the results attained it would appear that the inventor, if he has not discovered the ancient process, has devised an excellent substitute. Fire-gilded glass, says the *Echo*, is a glass into which gold is so worked that many hundreds of years have failed to effect any change or to tarnish the gold. The trustees of the British Museum were so pleased with the result of the modern process that they accepted from the inventor, Mr. D. Hussey, specimens of his recovery of a lost art. The process consisted in introducing gold leaf or platinum into the body of the glass, and amalgamating the precious metal with the glass by means of a blowpipe, an operation which also serves to produce a perfectly indestructible covering to the metal and the designs traced. The product so much resembles the ancient work that the method is likely to find a tolerably wide field of usefulness—or at least of profit to its inventor.

A GOOD CLEANSING FLUID.—The following is commended for washing alpaca camel's hair, and other woolen goods, and for removing marks made on furniture, carpets, rugs, etc.: Four ounces ammonia, four ounces white Castile soap, two ounces alcohol, two ounces glycerine, two ounces ether. Cut the soap fine, dissolve in one quart water over the fire, add four quarts water. When nearly cold add the other ingredients. This will make nearly eight quarts and will cost about 75 cents. It must be put in a bottle and stoppered tight. It will keep good any length of time. To wash dress goods, take a pail of lukewarm water, and put in a teacupful of the fluid, shake around well in this, and then rinse in plenty of clean water, and iron on wrong side while damp. For washing grease from coat-collars, etc., take a little of the fluid in a cup of water, apply with a clean rag, and wipe well with a second rag. It will make every woolen fabric look bright and fresh.

GREEN VARNISH FOR METAL ARTICLES.—A green varnish for metal articles may be thus prepared: Put as much red arsenic or mastic into a strong potash lye as will be dissolved by it, then dilute the solution with water, and add a salt of copper (vitriol or acetate of copper). The green precipitate should be washed, dried, and dissolved in oil of turpentine. Unfortunately, mastic is too dear for the varnish to be used for all purposes.

INCOMBUSTIBLE LAMP SHADES.—Lamp shades can be made incombustible by coating writing paper with two layers of water-glass of 16° to 20°. The paper becomes transparent, and is in many respects preferable to wax paper.

TREATMENT FOR HARD WOOD FLOORS.—It is true, says the *Journal of Chemistry*, that the oak floors of the old-fashioned kitchens, which lasted and looked well for a hundred years or more, were scoured with soap and sand; but the labor was very great, and could hardly be had from the modern servant at any reasonable expense. A little more care in filling and finishing, suits the present condition of things better. Any soiling from mud can be removed with a damp woollen cloth, and dust with a dry one. Sweeping with a brush, followed by wiping over with a dry woollen cloth tied over the brush, answers ordinary needs. About once in six months it is well to give the work a very thin coat of shellac. No oil should be used on it before or after finishing. The great mistake made in the treatment of hard woods, and especially where used in floors, is the amount of oil, wax, varnish, filling, and other gummy materials that are applied to and left on the surface. The beauty of all such finish is to have the wood show its natural color and grain. The thin coat of shellac, specified above, is meant simply to prevent any greasy dirt from striking into the wood and causing a stain that would require hard scrubbing or scraping to remove.

WINDOW-GLASS FACTORIES.—The *American Manufacturer* says that there are 106 window-glass factories in the United States, distributed in 13 States as follows: Massachusetts, 5; New York, 11; New Jersey, 34; Pennsylvania, 30; Maryland, 5; West Virginia, 2; Ohio, 6; Michigan, 1; Indiana, 3; Illinois, 5; Wisconsin, 1; Iowa, 1; Missouri, 2—total, 106. Of this total 33 factories are embraced in the Western Association. As each factory employs, on an average, from 50 to 75 persons, the 106 furnish work, when all are in operation, to about 7,000. The amount of common window-glass imported in the eight months ended February 28th was 13,777,838 pounds, which is at the rate of over 28,000,000 pounds a year, a quantity equal to the annual production of about 22 of our window houses.

IMMIGRATION.—Immigration, we learn from the *North American*, is beginning to show very favorable features again. A very large proportion of those who are sailing from Europe have taken return tickets, and a very small proportion of those now arriving have ever been in this country before. Last year 35% of the arrivals at Castle Garden had been in America before; of those now landing there, not more than 2% ever crossed the ocean until now, and the number is much greater than last year, over 3,000 having gone west from New York city last week.

GOOD HEALTH.

Drunkenness not Hereditary nor a Disease.

Recently, in Utica, New York, there was held a large temperance meeting, and members of the faculty of the New York State Lunatic Asylum, famous physicians, expressed their opinions upon drunkenness as a disease. Dr. Gray, the Superintendent of the asylum, said: "The idea of hereditary and transmission have induced men to blind themselves, and seek only gratification. It is not the father or the mother who is to blame for the son's drunkenness, but the son himself. I am glad to see so many women defending this cause. How many defend their husbands and sons on the ground that it was born in them. It cannot be born in them. A kind word from the mother to her boy may save him, where the pretense of hereditary may send him to ruin. Another point I am glad to see set forth—drunkenness is a disease. The State has erected an institution where the drunkard can reflect for a time on his habits, and perhaps reform himself, and it is hoped with the present superintendence much good will be done. When a man has a flask in his pocket he has the disease. If it is gone, there is no disease."

Dr. Ford said: Inebriety is not a disease, but a self-provoked, temporary perversion of our natural functions, induced for the purpose of sinful gratification. Brain-workers often engage to do more than their physical strength will sustain, and in order to accomplish this task in a given time, they resort to brandy to quicken their flagging energies, though at an expense of that reserve force which no man realizes. The stimulant is soon taken often, and before long he finds himself broken in health, and with a habitual drinking habit formed. First, intemperance is sometimes due to a defective organization, a defect allied to imbecility. Again, it is the logical result of a defective training. It is not an inherited condition, but is acquired, and a condition for which the individual is responsible. Second, drunkenness is not a disease, nor is it produced by any disease or physical condition. It is a moral obliquity. Alcohol is not a food, and is not a necessity to healthy men, while men that are weak by inheritance—weak physically and mentally—ought to shun alcohol as they would a deadly malady. Third, alcohol intemperates and always produces deleterious changes in the most vital organs of the body, from which spring the most mortal disease, and it increases the fatality of ordinary ailments. Fourth, it is the amount of alcohol used, and not the form under which it is used, that determines the amount of evil it will accomplish."

Removing Grindstone Dust.

The Smithsonian Institution has had a translation made of a recent French work on the preservation of health in workshops. We take therefrom a few suggestions on reducing the evils of the grindstone. One of the most dangerous occupations is that of the grinder. When proper precautions are not taken, the dust arising from the grindstones, which are used dry, enters into the respiratory passages. These dangers are reduced and almost removed by the following arrangements: The stones should be surrounded as completely as possible by a movable covering of wood or sheet-iron, which should have no opening in front but what is absolutely necessary for the work.

In order to avoid the choking-up of the ventilating-pipes, it will be necessary to provide special discharge-pipes for the water, according as the stoucs are partly below or entirely above the floor.

The passage intended for carrying the dust should be placed underneath the stone, and beyond the point where the work is applied, regarding the direction of the motion. It should have a breadth a little greater than that of the stone, and a depth of eight inches, at most, for the largest stones. A sliding door serves to close it whenever dry dust is not produced. The water-discharge pipe should also have a valve, which may be closed when water is not used, and when it is desired to carry off the dust produced when the stone is trued.

The separate air-tubes from each stone lead to a collecting-pipe 16 inches by 12 inches, to which they are united by couplings.

If there are only four or five stones in the works, a single collecting-pipe will be sufficient, and the blower should be placed at the end. But if there are eight or ten stones in one line, it will be better to place a second collector, 16 inches by 12 inches, in the middle of the length of the first, and perpendicular to its direction. The blowing apparatus should be placed in the extremity of the second pipe.

Finally, if there are two long parallel rows, with eight or ten stones in each, they should also be connected with the second collector, or with a third, 16 inches by 20 inches, communicating with the ventilator.

In all these arrangements, movable valves should be placed at the junction of each of the pipes, to prevent the circulation of air in those which are not used at any time for carrying off the dust, since it is not intended to ventilate at the same time all the stones of the same mill. The valves placed at the head of each pipe should also be closed when it is not being ventilated.

But the greatest difficulty in rendering these places healthful, as in most other cases, arises from the carelessness of the workmen, and in the negligence of the foremen, who do not insist on the strict observance of the regulations.

Maladjustment of the Eyes.

In a late address before the Albany Institute, Dr. Geo. T. Stevens, of Albany, presented facts which went to show that certain intractable nervous diseases, such as chorea, or St. Vitus dance, severe recurring headaches, and neuralgia, often hereditary, which seem to be functional and not due to any morbid change in the nerves, are very frequently accompanied by an often unsuspected maladjustment of the eyes, and that when this was properly corrected by suitable glasses, the nervous disease passed away. Thus in the case of very far-sighted young persons, the attempt to read or to sew requires a muscular adjustment of the focus of sight which is quite a strain on the most delicate organism in the body and the portion where the nerves in the optic nerve seem to be most exposed. Let a young person put on his grandfather's spectacles and try to read with them, and he is made dizzy and perhaps nausea or vertigo is produced. But this is the constant condition of some far-sighted persons, and it is not strange that their nervous system is thereby shattered. A still more common and unsuspected cause is what is called astigmatism, in which condition of the eyes they fail to form a definite image. The eyes bring, perhaps, the vertical rays to a focus sooner than the horizontal ones, so that there is not a clear, defined image. To test the eyes for astigmatism, draw on a sheet of white paper parallel black lines. Cross them at right angles by similar black lines. Put them on the wall and stand off at as great a distance as they can be seen and notice if the horizontal lines can be seen further than the parallel ones. Eyes not astigmatic would see them equally clear at any distance. Whether Dr. Stevens is right or not in supposing such disarrangements of vision to be a frequent cause of chorea and neuralgia—and he cites many cases to prove it—it is very important that they should be corrected by suitable glasses.

RUSTY NAIL WOUNDS.—The *Stockton Independent* says: Every little while we read of some one who has stuck a rusty nail in his foot or some other part of his person, and lockjaw has resulted therefrom. All such wounds can be healed without any fatal consequences following them. The remedy is simple: It is only to smoke such wound, or any wound or bruise that is inflamed with burning wool or woolen cloth. Twenty minutes in the smoke of wool will take the pain out of the worst case of inflammation arising from any wound we ever saw.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Motte's Mortar Mill; The Phillipsburg Mine; The Timber Land Question, 369. The Week: California as a Mining Country; Metric System Tables; Eureka Process, 373. Bodie District; Mining in Eastern Nevada; Marching Upon the Inevitable, 377. Patents and Inventions; California Pottery and Terra Cotta, 380.

ILLUSTRATIONS.—Cross Section of Comanche and Trout Hills, Phillipsburg, Arizona, 369. Fruit and Leaf of the Bread Fruit—Reduced from Natural Size, 374. Map Showing Location of Mines in Bodie District, The Town of Bodie, Mono County, Cal., 377.

CORRESPONDENCE.—Notes on Amador County. —No. 1: Determination of Minerals Under the Microscope, 370.

MECHANICAL PROGRESS.—Collapse Cured by Corrugation; Forging and Tempering Iron and Steel; Hard and Soft Solders; Fine Metal Working; Guns; Interesting Experiments in Steel Production; Germany and Home Industry, 371.

SCIENTIFIC PROGRESS.—Sulphur in Organic Substances; The Hughes Telephone; Ballooning; Entomological; The Brain of the Chimpanzee; Another Forment; Microscopical Congress; Anthropology; The Easiest Way to Drown, 371.

NEWS IN BRIEF on page 373 and other pages.

THE ENGINEER.—Rapid Transit on the Erie Canal; An Indian Bridge, 374. Colorado Projects; The New Clyde Docks; Railroads in Washington Territory; Great Pyramid of Egypt, 375.

USEFUL INFORMATION.—Petroleum Oils as Lubricants; Fire Gilding; A Good Cleansing Fluid; Green Varnish for Metal Articles; Incombustible Lamp Shades; Treatment for Hardwood Floors; Window-Glass Factories; Immigration, 375.

GOOD HEALTH.—Drunkennes not Hereditary nor a Disease; Removing Grindstone Dust; Maladjustment of the Eyes; Rusty Nail Worms, 375.

Mining Summary from the various counties of California, Nevada, Arizona, Colorado and Utah, 372-73.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards, Notices of Assessments, Meetings and Dividends, 380.

MISCELLANEOUS.—Discovery of a Mammoth Cave in Wyoming Territory; Mementoes of Bygone Black Hills Miners; Academy of Sciences; Reptiles and Insects in Australia, 370. The Bread Fruit; Coal Fields in Peru; Product of the Eureka District, 374.

NEW ADVERTISEMENTS.

Machinery, Berry & Place, S. F.; History of Bodie and Emerald Lake Summer Resort, Mrs. R. H. Culbertson, Emigrant Gap Dividend Notice, Consolidated Virginia Mining Co.; Meeting—Union Consolidated Silver Mining Co.; Assessment—Pacific Plumbago Mining and Manufacturing Co.

The Week.

No more favorable weather for all the great interests of the coast than has been experienced during the past seven days could have been desired. The growing demand for laborers in the harvest field continues, the supply in some sections of the interior being inadequate to the demand, notwithstanding good wages are everywhere being offered. The large yield of the California gold mines has as yet suffered no abatement, water for hydraulic washing continuing in good supply. More attention is being paid to quartz mining in this State just now than has been noticeable for years before, some of the companies that have recently commenced or resumed operations in the vicinity of Grass Valley and Nevada City having already developed ore bodies that make success nearly certain. The formidable revolt of the Bannock Indians announced during the week causes some surprise. The promptitude with which troops and supplies are being forwarded to the theater of disturbance meets with general approval and promises to effect the speedy and effectual subjugation of the savages. The delegates to the approaching Constitutional Convention seem likely to be made up in part from all the leading factions in the field, with a preponderance of those representing the more conservative element. The Potter investigation which appears to so agitate political circles in the East creates here scarcely a ripple on the surface of the political sea. The disposition evinced by Congress to take early action looking to a restriction to all parties on this coast, and would doubtless have had a quieting effect here had not the influx of the obnoxious race been very large of late. The National Legislature should lose no time in perfecting the measure they have in hand, rendering it sufficiently stringent to stay the tide of barbarism that is flowing in upon us.

California as a Mining Country.

Although California has been retired to a secondary position as a hulkion-producing country, it still remains in some respects the most important mining section of the Pacific coast. In the first place, the business of mining for the precious metals takes on here a more diversified character than in any of our other States or Territories. We have both gold and silver mines in California, our argentiferous ores embracing the several varieties that necessitate the use of both smelting and milling for their reduction. Our auriferous deposits are also of that varied kind that calls for the employment of multiplied means and methods for working them. We have our gold-bearing quartz lodes, yielding ores both free and refractory. These reach from one end of the State to the other. The quartz districts extend from the Coast Range into the depths of the deserts that skirt our eastern border. While vein mining has as yet been confined mainly to the foothill region of the Sierra Nevada, the business has been successfully prosecuted in many of its outlying spurs as well as in nearly all the other mountain chains in the State. There are promising quartz mines in the basin of Death valley, and up on the high benches of the Sierra. Our ore fields are illimitable, moderately fertile and generally well conditioned for economical working.

Our hydraulic mines are without a counterpart elsewhere. As regards their extent, product and the appliances in use for exploiting and working them, they are distinctively Californian. Of our drift diggings nearly the same may be said. Our gold beaches and bluffs are peculiar to the Pacific coast; so probably are our seam mines. Not elsewhere perhaps do they dredge out or undermine as here, the beds of the rivers. We have cement as well as ore mills; have hydraulic elevators for lifting the gravel out of undrainable pits, together with many other devices, kinds of mines and methods of mining not to be met with elsewhere throughout the west lands of the continent or in any other country.

The mines of California give employment to more laborers in proportion to their yield than do any others. Their product is at the same time diffused among many owners. We have few companies with large revenues, but many proprietors enjoying small incomes from their mining interests, the most of them being working men. This insures us a more permanent mining population, creates homes and families, and promotes the social well-being of all. The \$20,000,000 of bullion taken out in California does more for the cause of civilization and true progress than the \$40,000,000 taken out in Nevada. It is this more varied aspect of the business and the greater good it effects that engages the general attention and tends to keep alive the old-time interest in California as a mining country so long after she has lost rank as a bullion producer. In our next issue it is our purpose to review in a cursory way the mining industry of this State, following up the same in later numbers with similar surveys of the situation in the other Pacific States and Territories.

The Eureka Process.

Tests are now being made in this city, under the superintendence of Mr. Blanding, of Mr. Hallock's Eureka process, to which we have previously referred to in these columns. Mr. Blanding says it works well as far as it has gone in working small lots of ore from five pounds up to 38 pounds. It is a desulphurizing and amalgamation process, the ore being first roasted and then disintegrated by immersion in a solution, the nature of which the inventor keeps secret even from those working the ores. No crushing machinery at all is used. Some of the results attained are very high on certain classes of ores; when the ore has been properly roasted it has invariably given good results. No preliminary grinding is necessary, and after being put in the solution it becomes friable and easily worked. Mr. Blanding mentions as a curious circumstance the fact of working some Tuolumne county ore with large cubes of sulphurets, the cubes being from a sixteenth to an eighth of an inch in size. After being worked the form of the cubes was preserved, although the color was changed, but the gold was apparently set free without destroying the form of the cubes. The ores treated were weighed, heated in a forge, roasted and placed in the solution; then put in a Hephurn pan and ground, the whole occupying an hour and a half.

The tests have been conducted some two weeks and numbers of people have witnessed them. Mr. Blanding is still pursuing his tests, and, although he says the smaller ones seem successful, he declines expressing a decided opinion until more continuous work on a larger scale has been done. Moreover, he does not himself know the nature of Mr. Hallock's solution, and, until he does, of course cannot explain the rationale of the process, as he is yet working somewhat in the dark.

A HIGHWAYMAN robbed a man named Horton between Grass Valley and Smartsville, and while attempting to rob a second man was overtaken and compelled to take to the bushes, leaving his horse and accouterments behind him.

Metric System Tables.

We have prepared the following tables of the metric system, which give in a very condensed form a comparison of other measures with the metric system, by means of which anyone may institute comparisons readily and quickly. The tables are in a convenient form for reference, and are worthy of preservation. They fully explain themselves:

Deci. expresses the 10th part.
 Centi. " " 100th part.
 Milli. " " 1,000th part.
 Deca. " " 10 times the value.
 Hecto. " " 100 times the value.
 Kilo. " " 1,000 times the value.
 Myria. " " 10,000 times the value.

Weights.

Milligramme Mg. equals 001
 Centigramme Cg. " 01
 Decigramme Dg. " 1
 Gramme G. " 1
 Decagramme Dg. " 10
 Hectogramme Hg. " 100
 Kilogramme (Kilo.) K. " 1,000
 Myriagramme Mgr. " 10,000
 Quintal Q. " 100,000
 Ton T. " 1,000,000

The Gramme equals 15.434 grains.
 .0321 ounces troy.
 .0352 ounces avdps.
 .0022 pound troy.
 .0022 pound avdps.

Gramme equals weight of cu. cm. of water
 Kilo. " " " cu. dm. of water
 Ton. " " " cu. m. of water

Measures of Surface.

Centar Ca. equals 1 sq. m
 Are A. " 100 sq. m
 Hektar Ha. " 10,000 sq. m

The are or unit of surface, is a square the sides of which is ten meters and surface 100 square meters in U. S. surface measure. It equals

155,005. square inches.
 1,076. square feet.
 114. square yards.
 .008 square rods.
 .024 square acre.
 .00003 square mile.

Measures of Length.

Millimeter, Mm. equals 001 m
 Centimeter, Cm. " 01 m
 Decimeter, Dm. " 1 m
 Meter, M. " 1 m
 Dekameter, Dm. " 10 m
 Hektometer, Hm. " 100 m
 Kilometer, Km. " 1,000 m
 Myriameter, Mm. " 10,000 m

The meter, or unit of length equals 39.37 inches.
 .328 feet.
 1.09 yards.
 .0006 miles.

Measures of Capacity.

The liter, or unit of capacity, is a vessel whose volume is equal to a cube whose edge is one-tenth of a meter and capacity one one-hundredth of a cubic meter.

Millimeter, Ml. equals 001 l = 1 cu. cm.
 Centiliter, Cl. " 01 l
 Deciliter, Dl. " 1 l
 Liter, L. " 1 l = 1 cu. dm.
 Dekaliter, Dl. " 10 l
 Hektoliter, Hl. " 100 l
 Kiloliter (or Ster) Kl. st. equals 1,000 l = 1 cu. m.

The liter equals 61.027 cubic inches.
 .053 " feet.
 8.453 U. S. gills.
 2.113 " pints.
 1.056 " quarts.
 .264 " gallons.
 7.043 Imperial gills.
 1.700 " pints.
 .220 " quarts.
 .110 " gallons.
 .027 " bushels.

Table of Proportions—Including Length, Surface, Capacity, and Weight.

LENGTH	SURFACE	CAPACITY	WEIGHT	PROPORTIONS
Millimeter	Centimeter	Decimeter	Meter	1,000th part
Centimeter	Decimeter	Meter	Decimeter	100th part
Decimeter	Meter	Decimeter	Meter	10th part
Meter	Decimeter	Meter	Decimeter	10 times
Decimeter	Meter	Decimeter	Meter	100 times
Meter	Decimeter	Meter	Decimeter	1,000 times
Decimeter	Meter	Decimeter	Meter	10,000 times
Meter	Decimeter	Meter	Decimeter	100,000 times
Decimeter	Meter	Decimeter	Meter	1,000,000 times

Telephone, Microphone, and Phonograph.

EDITORS PRESS:—Noticing in the *Alta* of June 6th, an editorial entitled "The Latest Marvelous Discovery in Science," in which Prof. Hughes' microphone was described, I desire to ask if it is not identical with Prof. Edison's instrument for increasing sound, and if so to whom belongs the honor of the invention? Further, whether the instruments known as the telephone and the phonograph are American or British inventions; and also what the earliest date at which their working was made public?—J. B.

It is claimed by Prof. Edison's friends that his and Prof. Hughes' devices are identical or exceedingly similar, but they do not claim that Hughes drew it from Edison's. The future only can settle the issue.

The instruments are American inventions. As nearly as we can recollect, the telephone by Prof. Bell was first brought out in the summer of 1876, and the phonograph and microphone by Edison during the summer of 1877.

GAS NOTES.—We learn that the Reno Gas Works are being provided with fine condensers, lime purifiers and station meters, under contract with the well-known Gas Engineer, J. R. Smedburg, who has already erected a setting of wood gas retorts and one of his exquisite Pelouze and Andoin condensers at the same station. This late move completes the change from oil to coal and will win a gas of very high purity and candle power from the pitch pine of the Sierra Nevada without any admixture of Australian shale to enrich. It is anticipated that 25,000 cubic feet of purified gas will be obtained from a cord of this wood, but we are promised the actual result for publication in an early number.

Bodie District.

From Mr. Wasson's little pamphlet on Bodie and Esmeralda districts, just published, we take an engraving, showing the new town of Bodie, and also some facts concerning the place. The author says:

The winter following the commencement of the extensive operations of the Standard company (1876-7), was comparatively mild, and business men generally began to turn their attention to Bodie district. The new mill then building soon suggested a remapping and construction of a town. The site selected is a pretty one, and stretches along the western base of the bluff from the narrowing valley north and extending along the more open country south—a grassy flat between the sloping hills. There is room in which a large city could be built with but little expense as to grading. The sketch giving a side and partially bird's-eye view of the town, bluff and leading hoisting works, was taken from a high, black cliff of rocks, one and a half miles southwest of the town, from which point High Peak (so prominent when directly under it) sinks into a small protuberance upon the main bluff. There is scarcely a shrub of timber left, if any ever existed, which gives a rather unsheltered look to the situation, but less so than is seen in many other mining towns east of the Sierras. Excellent water from springs and wells pertaining, in town, is obtained sufficient as yet for ordinary uses. One large central spring—a rallying point of early times—is chiefly absorbed by the Standard mill. In connection with this spring an historic cabin existed on the site of Gilson & Barber's store—said to have been Bodie & Taylor's, and also where the original miners' meeting was held, organizing the district. But these accounts must reconcile themselves along with a variety of others encountered during the preparation of these pages. To return to the building of the present town. A wooden structure was moved over from Aurora, in which the express and Postoffice and Smith's store was located. Towards spring and summer, building assumed a brisk phase, and toward winter of last year it began to present the aspect of a rush, and everybody was more or less inconvenienced by the scarcity of lumber, to say nothing of high prices. Timbering for the mines was in the same market and wood for fuel also, but nothing serious ensued. It is a wooden town and in itself contains about 250 structures, some very prescient onns. About the mines proper there are about 100 additional habitations and shelters of one kind and another. Last winter, moreover, was a pretty severe one, though the mail and express were delivered regularly—no day failing to get through each way. The U. S. Land Office has been moved from Independence, Inyo county, to Bodie. The following extract from Ross Browne's magazine article, Aug. '65, may be in place:

Although the altitude is greater than that of any other inhabited town within the limits of the United States, and only surpassed by that of Quito, in South America, the climate is exceedingly healthy—never too warm in summer and rarely rigorous in winter. During the past winter (1863-64) the snow did not remain on the ground more than a day or two at a time; and there was a period of two months without snow, rain or unpleasant weather of any kind. This, at an altitude of 9,000 feet, is remarkable.

Bodie now has a flourishing and well-conducted journal, the *Standard*, has also telegraphic connection with this world at large. Over 400 men are employed in and about the mines, who receive \$4 per day. There are about 2,000 people in the vicinity. The Standard company employ about 75; Bechtel, 40; Syndicate, 30; McClintock, 20; Red Cloud, 20; and the Bodie, Bulwer, Belvidere, etc., 15 to 20; the Black Hawk and others, 10, and a score of mines from 5 to 10. This, and the employment given to teamsters, woodcutters, exclusive of clerks, etc., about town, will make the estimate good.

The accompanying map shows the location of the different claims in Bodie, and is partly approximate in its location of claims, and partly

made from actual surveys. Daily changes are taking place of course, but the general character and extent of the work done is sufficiently set forth in Mr. Wasson's pamphlet to render the publication valuable for future reference. A detailed description of the different mines is given, with a condensed history of each one, its product, etc.

"HYDRAULIC MINING—PLACER AND WATER RIGHTS."—This is the title of a small pamphlet, prepared and just published by T. F. Van Wageningen, mining engineer, and M. B. Carpenter, lawyer, of Denver, Colorado, and wherein is

Mining in Eastern Nevada.

Mr J. T. McCurdy writing from Osceola, White Pine county, Nevada, informs us that considerable work is now being done in the Silver Mountain district, in that vicinity, the outlook for some of the companies opening mines there being very good. In the Clipper claim a 14-foot ledge has been cut, which carries a free milling ore that has assayed as high as \$400 per ton. The Plagerman ore yields under working process \$50 in silver per ton, and 50% lead. The Golden Gate ore has gone by

Marching Upon the Inevitable.

Never before, perhaps, has society this world over been pervaded by such a spirit of discontent as at present. Everywhere is commotion, turmoil and unrest. And wherefore? Why is it that at a time of universal peace, with neither pestilence or famine widely prevalent, when popular education and free government have been extended, wealth and the comforts of life multiplied and the severer burdens of labor have been lightened by toil-saving inventions, that suffering, destitution, insanity and crimes

should have been steadily on the increase? Of course everybody is ready with an answer to this question. Everybody knows it is because we have been spending too much and producing too little. Mankind have fallen into idle, luxurious and spendthrift habits, which they have only to correct and all will be well. There are those, too, who argue that certain social, political or industrial reforms are necessary, they also being right. Doubtless all have a proper conception of the nature and causes of these world-wide troubles and know just the remedy that should be applied for their correction. But here is precisely where the difficulty commences. Are we capable of applying these remedies? The patient knows he is sick and what would cure him, but possibly he has not strength enough left to stand a remedy so drastic as his case requires.

Nations, like individuals, die. They die from inanity and exhaustion, brought on through the indulgence of vicious and debilitating habits, that lead at length to their extermination, or, what is worse, reduce them to a drizzling fatuity, more deplorable than annihilation itself, for national imbecility is worse than national death. Mankind have never been without their unhealthful and unnatural excipients. Later, however, these have been greatly multiplied and their use widely extended. In former times these deleterious stimulants were few and their use confined mostly to the higher classes. About the only intoxicating beverage among the ancients was wine. Now we have many others, all more hurtful, and to which means of stimulation we have superadded tobacco, opium, tea, coffee and various other substances, all more or less injurious to both the body and the mind. These pernicious excipients began to come into general use a long time ago, nearly all of them having been indulged in quite largely for several generations. At first the masses, leading otherwise simple lives, with much out-door exercise, no very marked effects followed the use of these stuffs, whether exhilarating or narcotic. But gradually their habits became less invigorating, calling for an increased use of these excipients and sedatives to soothe nervous irritations or tone up the system, the taste for the same growing all the while stronger through hereditary transmission.

And now it may be that these appetites, through the operation of prenatal causes, have become so constitutionally inherent, so incorporated with their nature before birth, that the mass of mankind can no longer resist the desire for their gratification. There is a danger that this is so. They who have studied the physiology and psychology of these questions, tell us that sooner or later this must happen and that very likely the masses have already been reduced to this helpless condition. If so, then it is to little purpose we urge the practice of greater industry and economy or otherwise call upon them to reform. To effect this requires a degree of physical strength and a will power which perhaps they do not possess, in which view of the case it becomes as useless to appeal to these hereditary thralls to emancipate themselves from their serfdom as it would be unjust to condemn them for not doing so.

The *Territorial Enterprise* says that General W. H. Williams will not, according to his own announcement, be a candidate for the United States Senate, from Nevada, as he is now a resident of California.

The Colorado river is said to be quite high, and the steamers running up from Yuma encounter a serious obstacle in navigating that stream at present from the swift current.

MAP SHOWING LOCATION OF MINES IN BODIE DISTRICT.

contained a variety of rules for determining the weight of water, gravel, etc.; also, rules for solving many practical problems connected with hydraulic mining, such as measurement of water, construction of reservoirs, dams, ditches, flumes and other water-ways, together with directions for building and laying down iron pipes, sluices, etc., with much other information in regard to hydraulic mining, cost and kinds of apparatus, etc. In an appendix is given a synopsis of the leading provisions of the United States laws and the laws of Colorado relating to placer mining and water rights, with forms for notices

assay as high as \$11,000 to the ton. Reed's two claims work \$70 silver per ton, and 30% lead. These mines are all being actively worked, also the Champion and Centennial. The Utica, Scorpion and Silver Brick claims have lately been incorporated in the East. They are good properties, the ore assaying from \$60 to \$140 per ton in silver and carrying about 60% lead. The present owners will soon put up smelting works for its reduction. This district is well supplied with wood and water, and the ores can be treated on the ground at a moderate cost. There is also much grass with some

out their unhealthful and unnatural excipients. Later, however, these have been greatly multiplied and their use widely extended. In former times these deleterious stimulants were few and their use confined mostly to the higher classes. About the only intoxicating beverage among the ancients was wine. Now we have many others, all more hurtful, and to which means of stimulation we have superadded tobacco, opium, tea, coffee and various other substances, all more or less injurious to both the body and the mind. These pernicious excipients began to come into general use a long time ago, nearly all of them having been indulged in quite largely for several generations. At first the masses, leading otherwise simple lives, with much out-door exercise, no very marked effects followed the use of these stuffs, whether exhilarating or narcotic. But gradually their habits became less invigorating, calling for an increased use of these excipients and sedatives to soothe nervous irritations or tone up the system, the taste for the same growing all the while stronger through hereditary transmission.

THE TOWN OF BODIE, MONO COUNTY, CAL.

and other proceedings thereunder. The book, which is of convenient size to be carried in the pocket, is sold at 75 cents per copy.

TYSON'S AMALGAMATOR.—A recent clean-up of Bryan Tyson's new washer and amalgamator at Smartville yielded 42 ounces of amalgam. It is situated at the tail end of an undercurrent 48 feet long, all the gold and quicksilver first passing over said undercurrent. It is perhaps, the only piece of machinery working in a gravel mine in the State. It is expected that some recent improvements, yet to be added, will largely increase the catch of fine and rusty gold.

WM. CULLEN BRYANT, the poet-editor, died at New York, on Wednesday morning.

good farming land in this district, which lies in the extreme eastern part of Nevada, close to the Utah line.

THE beach from Aptos to Watsonville, Santa Cruz county, has lately been taken up with mining claims. There is fine gold there, but the thing is to get it. Last winter the miners did very well; sometimes making \$10 apiece per day, but the water gave out and now they are going to try and dig a well and pump water with a steam engine. They have been at work about a month and have not yet accomplished anything.

JAMES DOWNEY, a native of New York, aged 63 years, jumped overboard from the *El Capitán*, Saturday night last and was drowned.

FOREIGN PATENTS

FOR PACIFIC STATES INVENTORS

ARE SECURED IN MUCH LESS TIME,

—BY—

DEWEY & CO.,

PROPRIETORS OF THE

Mining and Scientific Press,

THAN THROUGH ANY OTHER AGENCY.

Established in 1860.

THIS FIRM CAN BE RELIED UPON

—AS—

Honest, Competent, Permanent,

ALL OF WHICH POINTS ARE IMPERATIVELY
REQUISITE IN ATTORNEYS, FOR THE IN-
TERESTS OF THEIR APPLICANTS FOR
PATENTS IN DISTANT LANDS.

Our Associates and Correspondents are the
Best Practitioners in every country where Pat-
ents are granted.

For Foreign Patents no model is required, as
a rule, except in Canada. The Specifications
and Drawings of the American Patent, if com-
plete and perfect, will suffice for us to prepare
the case. In Great Britain and other countries
we apply for patents in the inventors' own
names, thus avoiding their being published to
the world in the name of a foreign agent, as is
usual through other and less painstaking agen-
cies.

Frequently several inventions, covered by
different patents in the United States, on the
same subject, can be skillfully combined in one
patent in foreign countries, when well under-
stood by intelligent attorneys.

As the privileges of our inventors are cut off
in some countries, and curtailed in others, if not
applied for soon after the issue of the U. S.
patent, we advise inventors whose patents will
be valuable in various populous civilized coun-
tries, to lose no time in applying for patents
whenever they intend to obtain them for them-
selves or the benefit of others—with their own
means or through the resources of those who are
permitted to share the benefits. It must be
remembered that the English (and some other
important nations) invite the early introduction
of inventions into their realms, by offering pat-
ents to the first introducer (which means the
first applicant), without regard to the rights of
the actual inventor, who has no after recourse.

For important inventions it is best to apply
for foreign patents at the time of application for
or before the issue of the U. S. patent.

Term of Patents in Foreign Countries.

COUNTRIES.	PERIOD OF YEARS GRANTED, ETC.
Australian Colonies:	
Victoria	14 years in successive periods, 3, 4 & 7 yrs.
Tasmania	14 years in successive periods, 3, 4 & 7 yrs.
New South Wales	7 to 14 years.
Queensland	7 to 14 years.
New Zealand	Full term, 14 years.
Austria	15 years, by annuities.
Argentine Republic	25 years or more, de- termined by govt.
Belgium	20 years by annuities.
Brazil	5 to 20 years.
Canada, (including British Columbia)	14 years.
Chile	25 years or more, de- termined by govt.
Cuba	5, 10 and 15 years.
Denmark	5 to 20 years, at the option of govt.
England	14 years, in successive periods, 3, 4 & 7 yrs.
France	15 years, by annuities.
German Empire	15 years.
Italy	12 years, by annuities.
India	14 years, 5 copies, spec- ification required.
Mexico	Full term, 10 years.
Norway	5 to 10 years, at the option of govt.
Portugal	Importation 5, Inven- tion 15 years.
Peru	25 years or more, de- termined by govt.
Russia	Importation 1 to 6 yrs, Invention, 3, 5, 10 yrs.
Spain	Importation 5 yrs, In- vention 5, 10, 15 yrs.
Sweden	3 to 5 yrs, at the op- tion of government.

We have the Foreign Patent Laws, Foreign
Patent Reports, and other valuable and assist-
ing documents, for ready reference in our MIN-
ING AND SCIENTIFIC PRESS Patent Agency Li-
brary—the most complete Patent Library on
this side of the Continent.

The cost of patents in any one or more of the
above countries will be furnished on applica-
tion to us.

Any further information regarding the time
within which patents must be worked in any
foreign country, time of payment and amount
of annuities for patents in any of the above
countries, will be cheerfully given on applica-
tion.

Full particulars regarding any countries not
named above, will also be given when desired.

REGISTER YOUR
TRADE

MARKS.

The U. S. Government now offers greater protection
than formerly to manufacturers under the law of Trade
Marks.

Those who manufacture a superior article, or put up
improved packages of merchandise, should protect them-
selves from imitations by registering their Trade Marks.
We have special facilities for securing full rights by the
registration of Trade Marks, and our terms are very reason-
able.

Consultations free. Many dealers have missed fortunes
from not being fully informed and protecting themselves
in their rights.

Designing

and

Engraving

at

This Office.

We are prepared to do fine Wood Engraving
for illustrating Landscape Scenery, Buildings,
Machinery, Works of Art, Manufactured Arti-
cles, Trade Marks, Seals, etc. We have a
first-class

Machine for Engraving

A portion of the work, which can be finished
thereby more perfectly than by the eye and
hand alone. Our patrons can depend upon
first-class work always, and at reasonable prices.
Samples can be seen at our office.

DEWEY & CO.

UNITED STATES

Mineral Land Laws, Revised Statutes,
AND INSTRUCTIONS AND FORMS
UNDER THE SAME.

We have just issued a pamphlet containing the General
Mineral Land Laws of the United States, with instructions
of the Commissioner of the Land Office. The contents of
this pamphlet comprise all of the Government laws with
relation to mineral lands of interest to the mining com-
munity, as follows: Mining Statute of May 10th, 1872,
with Instructions by the Commissioner of the Land Office;
Mining Statute of July 26th, 1890; Mining Statute of July
9th, 1870. Forms required under Mining Act of May 10th,
1872, as follows: Notice of Location; Request for Surveys;
Application for Patent; Proof of Posting Notice and Dia-
gram of the Claim; Proof that Plat and Notice remained
Posted on Claim during Time of Publication; Registers'
Certificate of Posting Notice for Sixty Days; Agreement of
Publisher; Proof of Publication; Affidavit of \$500 Im-
provements; Statement and Charge of Fees; Proof of
Ownership and Possession in Case of Loss or absence of
Mining Records; Affidavit of Citizenship; Certificate that
no Suit is Pending; Power of Attorney; Protest and Ad-
verse Claim; Non-Mineral Affidavit; Proof that no Known
Veins Exist in a Placer Claim, etc. There is also given the
U. S. Coal Land Law and Regulations thereunder. The
work comprises thirty pages, and will be sold, post-
free, for 50 cents. It should be in the hands of every
one having any mining interests. DEWEY & CO.,
Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Smelter and Refiner.

A competent person is desirous of receiving the position
of Superintendent of a Smelting and Refining Works.
Can give satisfactory reference for ability to smelt all lead
ores, refine silver and make market lead. No objections
to go to the Territories. Address P. F. M., this office.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued,
contains the United States mining laws and instructions
thereunder, a digest of decisions, forms, list of mining
patents issued, etc. The digest of decisions alone is a
very valuable thing, giving, as it does, in brief form, all
the decisions of the Secretary of the Interior and Com-
missioner of the General Land Office in relation to mining
matters. These are all under proper headings for easy
reference. Forms are given for notice of location, proof
of labor, notice of forfeiture, miners' lien, application for
survey, patent, etc., affidavit of improvements, etc.
There is also a list of patents issued for mining claims
from July 20th, 1868, to August 1st, 1877. The book is
of pocket size and very convenient for all who are in-
terested in mines. It will be sent post-paid for \$1, on ap-
plication to Dewey & Co., 202 Sansome street, San Francisco.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT
for DIAMOND POINTED DRILLS, now brought to the
highest state of perfection, are prepared to fill orders
for the IMPROVED PROSPECTING AND TUNNELING
DRILLS, with or without power, at short notice, and
at reduced prices. Abundant testimony furnished of
the great economy and successful working of numerous
machines in operation in the quartz and gravel mines
on this coast. Circulars forwarded, and full in-
formation given upon application.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 83 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day.....3 00
Wood, 14 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
Cost of one ton.....67¢
From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

25 Fashionable Cards, no two alike, with name, 10c postpaid. OEO. L. REED & CO., Nassau, N. Y.

R. HOE & CO.'S CHISEL TOOTH MILL, SHOP, And Edger Circular Saws with Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, and now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remain sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Filee are deepened with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in Mining and Scientific Press.

H. L. TATUM & Co., Sole Agents,
No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CUPS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or stop, and at a merely nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAME MAKE.

WATER TANKS of any capacity made entirely machinery. Materials the best in use; construction excellent. Pan Staves, Tubs and Oak Guides for mining purposes a specialty.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission and Fremont Streets

Certificate of Partnership.

The undersigned having, January 1st, 1878, formed a partnership to carry on the business of general machinists and engineers in constructing and repairing machinery under the firm name and style of Birch, Argall & Co., this certifies that the principal place of business of said partnership is situated at 119 Beale street, in the city of San Francisco, State of California, and that William H. Birch and John Argall, each residing in said city, are all the members of such partnership.

WM. H. BIRCH. [Seal.]
JOHN ARGALL. [Seal.]

STATE OF CALIFORNIA, } ss.
CITY AND COUNTY OF SAN FRANCISCO, }

On the twenty-fourth day of May, A. D., one thousand eight hundred and seventy-eight, before me, J. Robert Read, a notary public in and for said city and county, residing therein, duly commissioned and sworn, personally appeared William H. Birch and John Argall, known to me to be the persons described in, whose names are subscribed to, and who executed the annexed instrument, and they acknowledged to me that they executed the same.

In witness whereof I have hereunto set my hand and affixed my official seal, at my office, in the city and county of San Francisco, the day and year last above written.

J. ROBERT READ, Notary Public.
[Seal.]
Endorsed—Filed May 29th, 1878.

RE-ISSUES.
ONE ROASTING FURNACES.—Charles Stetefeldt, S. F.
TRADE-MARKS.

OVERLAYS, JUMPERS AND ORNAMENTS OF OUTSIDE WEAR.—Berthold Greenbaum, S. F.
LEMONADE COMPOUND.—Abrams & Carroll, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.
NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

California Pottery and Terra-Cotta.

In the hands of a master clay is one of the most obedient servants. There is no form too light and spirit-like for it to assume, none too grand and majestic for it to take on, and it is so plastic under the touch that the artist in marble always realizes his ideal in clay before he immortalizes it in the snowy marble. At the same time the working of clay for the finer varieties of porcelain, and, for that matter, in the making of even the commonest of pottery and fire brick is an art of no low order. And it is probable that of all the arts and sciences more money has been spent in experimental investigation of this subject than in any other. The art is one of the oldest which man has known. Fragments of rude vessels are found among the ruins of the oldest civilizations. Frequently these fragments show a knowledge of the art which is now lost to us. There is a sort of fascination about the potter's furnace, and there is no one, perhaps, who cannot understand the weird spell that hung over Palissy when he fed into it even the food and furniture of his own household.

In Scotland, England, Germany and France are manufactured fire brick, china, porcelain and terra-cotta ware, which, with that of China and Japan supplies the markets of the world. In Europe these industries have grown to such dimensions that the labor employed is numbered by the thousands and the capital invested by the millions. We have noted of late a marked growth of some of these branches on our coast with much pleasure. We learn that the beds of clay already discovered in our State are practically inexhaustible. The clay is said to be of good quality, and when our manufacturers have learned how to deal with it, we see no reason why this industry should not be one of the most valuable in our State. We are of the opinion that the mining and agricultural resources are by no means the only ones in our State, and we wish from time to time to point out the directions in which capital and labor may find profitable remuneration.

In furtherance of this idea we lately paid a visit to the California Pottery and Terra-Cotta Works, Of Mr. James Miller, on the Alameda road, as his establishment seemed the neatest and most workmanlike that we had seen. We were agreeably surprised to find in Mr. Miller as much of the artist as his countryman, Bobbie Burns. Mr. Miller, it seems, comes from a long line of potters, and studied his trade not only in Scotland and England, but under the most favorable circumstances in nearly all the famous factories of France. A true artist withal, it seems almost a pity that such a man should be confined to the molding of chimney tops and sewer pipes, even if they be of the most artistic shape.

Mr. Miller was kind enough to show us through his works and so enable our readers to learn what is being done in this direction. Four kilns are in constant operation, either burning or being emptied and recharged. The clay used comes almost entirely from Ione, where almost inexhaustible beds have been found. The articles manufactured are at present chiefly chimney tops of the most graceful shapes, as well as tops for smoky chimneys, which are so familiar to people who have lived in the old country. He is at present manufacturing for a physician of Oakland a patent hygienic filter, a very neat and useful arrangement for filtering water through successive layers of sand and charcoal. At the same time, as the ware is porous, a gradual evaporation from the

surface of the vessel takes place, thus rendering the water cool in the hottest weather and yet not giving it that unhealthy chill which ice always imparts. They are made in two sizes, one filters 25 to 30 gallons of water in 24 hours, the other 10 to 15 gallons in the same time. We can recommend these filters to all who are affected with a horror of animalcula, as at once healthy and handsome. The Oakland office is at 465 Ninth street.

We were much amused at being shown some handsome vases of terra cotta, that they were frequently bought up just as they came from the furnace and resold as coming from Europe. This does not seem improbable, as to the eye of the initiated it would be very difficult to detect the difference.

The manufacture of sewer pipe has already become a very important branch of manufacture. It is at once a very cheap and efficient substitute for the cumbersome and uncertain wooden drains which were once in vogue. Mr. Miller assured us that he was prepared to make this pipe of the best material and would guarantee it to be proof against the action of acids. Our chemical and metallurgical men should give him a trial.

We hope to see still greater developments in this direction. There is no reason, when we learn to understand the nature of our clay beds, that the finest of china and porcelain should not be here manufactured as it is in China and Japan. It would give employment to thousands of our idle laborers and prove a permanent source of income to the State. We hope that the University of California will assist in this matter by undertaking an investigation of our clays from a chemical standpoint. We learn that there is some talk of so doing and our readers can do much to assist in this matter.

A SHORT HISTORY OF PETROLEUM.—The *Lumberman's Gazette* gives the following short history of petroleum: The production of petroleum as an article of trade dates from the 28th of August, 1859, when Col. Drake, in a well 69½ feet deep, "struck oil," and coined a phrase that will last as long as the English language. From that beginning it has increased to an annual production of 14,500,000 barrels of crude oil. The first export was made in 1861, of 27,000 barrels, valued at \$1,000,000, and the export of petroleum for the year 1877 was, in round numbers, \$62,000,000. The annual product of petroleum to-day—crude and refined—is greater in value than the entire production of iron, and is more than double that of the anthracite coal of the State of Pennsylvania, and exceeds the gold and silver product of the whole country. As an article of export it is fourth, and contests closely for the third rank. Our leading exports are relatively as follows: Cotton, annually, from \$175,000,000 to \$227,000,000; wheat flour, from \$69,000,000 to \$130,000,000; pork and its products (bacon, ham and lard), from \$57,000,000 to \$82,000,000, and petroleum, from \$48,000,000 to \$62,000,000. The total export of petroleum from 1861 and including 1877 (16 years) has been \$442,698,968, Custom House valuation. From the best sources of information there are at this time 10,000 oil wells, producing and drilling, which at an average cost of \$5,000 per well would make an investment of \$50,000,000 in this branch of the business. Tankage now existing of a capacity for 6,000,000 barrels cost \$2,000,000, and \$7,000,000 has been invested in about 2,000 miles of pipe lines connected with the wells. The entire investment for the existing oil production, including purchase money of territory, is something over \$100,000,000, which amount cannot be lessened much, if any, for as wells cease to produce new ones have been constantly drilled to take their place.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

EXAMINE the accelerated endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, \$30,533,429.94. Lewis C. Grover, President; J. Spencer Noble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

Mr. W. J. WOONLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

MONEL MAKER AND MACHINIST.—I. A. Heald, No. 514 Commercial St., San Francisco (fourth floor).

ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the PACIFIC RURAL PRESS for January 20th, and also the MINING AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the PRESS as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

To Ship and Engine Builders, Steamship Companies, Etc.

A Mechanical Engineer, having an extensive experience in Marine Engineering (especially compound) and Iron Ship Building, also in Steam Engines and Machinery in general, is open for engagement. First-class references. Address and references can be obtained at office of SCIENTIFIC PRESS.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed to the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. VOLUME XXXVI.
Number 25.

The Rigby Governor.

We illustrate herewith an improved governor for steam engines, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by James A. Rigby, of Carson City, Nevada. It may be applied to any engine, but is more particularly intended for those that are subjected to severe and sudden changes in the resistance to the power they supply.

The invention consists in a novel construction of the main governor valve, and in combination with it, an operating engine, the valve of which is controlled and the admission of steam regulated by a revolving ball governor. This governor is mounted on a spindle having a pulley in its center, and which is driven by the frictional contact of another pulley, and the latter pulley is so mounted that the breakage of a belt allows it to immediately swing out of contact with this first pulley. A spring upon the governor spindle then acts to draw it back and with it the valve stem and valve, so as to shut off steam from its cylinder, and this allows the main steam valve to be closed, so as to stop the engine or reduce the speed.

This is in brief the method of operation, the details being shown in the engravings, of which Fig. 1 is a view of the governor, and Fig. 2, a section of the valve, globe, operating cylinder and valve chamber.

A is the main valve chamber, having steam ports, B, B, and a passage for steam around the outside of the vertical valve seat. C is the main steam valve, made with two pair of wings, to act as a counterbalance to the draft of steam when the valve is open, as the steam, in passing from the valve chamber, has a tendency to make the valve cover the ports. D is the main valve stem, turning in a step at bottom and it extends out through the top, having a vibrating crank, E, secured to its upper end. This crank is moved by means of a crank pin and sliding box, F, that is secured to the end of a piston rod of the small engine, a governor cylinder, G. Steam is admitted into this cylinder by a piston valve, H, which is perfectly balanced; but a rotary or any other form of valve might be used. The valve in the present case is operated by a small revolving ball governor, having spiral springs, I, I, arranged as shown, for the purpose of overcoming the centrifugal force of the balls. These springs are attached to the governor ball by thumb screws, K, K, and can be tightened or loosened to increase or diminish the speed of the engine at will. The stem of the valve, H, has a deeply grooved wheel or pulley, J, upon the end and the arm, J', extend inwards from this angle at which they, as a part of the bell-crank governor arms, are pivoted, so that their ends are retained in the groove, as shown; and as this ball and spindle revolve, they will revolve within this groove, and by their action they will move the valve backward and forward.

The valve stem is prevented from rotating by means of a pin, N, which extends from the wheel, J, into a hole in the end of the valve chest, or metal of the cylinder, so that the wheel and valve stem will not be rotated by the action of the rotating arm, but will only receive from it a reciprocating motion.

The governor balls are small and rotate rapidly, being driven by a pair of friction wheels, L, L', held in contact by the governor belt, in such a manner that when the belt breaks or becomes slack, the lower wheel swings free from the upper, being mounted on a crank arm, R, so as to allow the upper wheel to be pushed away from the standard supporting the governor by a spiral spring, M, on the governor spindle. This lowers or pushes the ball governor and its spindle so far back as to close the valve, H, of the governor cylinder, thus producing a simple and perfect stop motion.

N' is a metallic finger at the end of the piston rod that runs a shafting bar, and by an automatic movement shifts the governor belt on the cone pulley, P, thus increasing or diminishing the motion as required, and by its own action. It will be seen that when the pulleys, L, L', are out of contact, the pressure of the spring, M, forces the pulley, L', out of line with the pulley, L, and thus draws the governor spindle, and, by means of the arms, J, the valve stem back, so as to close the valve. When the pulleys are

brought into contact, their V-shaped grooves and edge serve to draw the pulley, L', into line, and of course this compresses the spring, M, and moves the spindle and valve stem so as to open the valve, H. This admits steam to the cylinder, G, and moves its piston so as to turn the crank arm, E, and this turns the valve, C, so as to open it. The action of the governor balls is then transmitted through the arms, J, to the valve, H, and the amount of its opening, and through it, that of the main valve is determined.

The inventor overcomes the tendency of the governor to overact in several ways. First, by using very small induction ports to the governor cylinder, so that a little vibration of the governor balls shuts off the steam from the governor cylinder. The port is governed and its size reg-

ulated by a screw which operates to enlarge or diminish the size of the openings, and this prevents to free an admission of steam to the cylinder, G, which would open the main valve, C, too suddenly. Secondly, by a spring bumper, Q, arranged as shown. When the engine has arrived at the requisite speed and the main steam valve is about half way closed, the said spring bumper will act immediately and cause the valve to begin opening. It also shuts off the steam from the governor cylinder by acting upon the shifting bar above described and the belt on the cone pulley, P, so as to prevent the engine from running above speed when relieved of its work. This spring bumper, however, is only required when the main valve is balanced, and has a tendency to close of itself. Thirdly,

in use there are experimental ones, and not satisfactorily made, but the inventor considers that by their use he is enabled to cut out 10,000 feet at each mill more than it would be possible with any other. For further information address the inventor as above.

CASA DIABLO.—On the road from Benton to the new Lake mining district is a singular spring of boiling mud called the Casa Diablo. The spring is about 10 feet in diameter and it is filled with mud that is constantly boiling and bubbling. When a pole is thrust into it the spring spits and sputters furiously for a time as though to resent the stirring up. At times

FIG. 1. THE IMPROVED RIGBY GOVERNOR.

this spring is said to spout mud to the height of 20 or 30 feet, spattering the ground in all directions and sending down the slope on which it stands quite a brook of steaming slum. Near the mud spring is a spring of hot water about five feet in diameter. In the center of this a column of water constantly boils to the height of about two feet, with a rippling noise that can be heard to a considerable distance. From this spring flows a stream of about 10 inches of boiling hot water. From the mud spring nothing flows, except when it takes one of its tantrums. These springs are about five miles from Lake district. A man who thinks he sees a fortune in the springs has located them, is building a house near them and claims that between them they are more than a match for all the ills that

the ill-odored waters of the Comstock. —Assistant Superintendent Patton, of the Bonanza mines, has sent a demijohn of water taken from the bottom of the Ophir 1900 level winze to San Francisco for analysis. It is supposed to contain minerals of various kinds leached out of the ore and rock of the vein. When it stands for a short time in the bottom of the winze—that part below the 2000 level being at present used as a sump—a thick green scum rises upon it. Its odor is very offensive. When a few buckets of it have been hoisted the exhalations from it load the air and sicken the men. Mr. Patton is of the opinion that the water, which is very hot, may be found to contain some silver, leached out of the chloride contained in the ore. Whether or no it contains silver it is of interest to ascertain just what minerals there are in it to give it an odor so disgusting, and to cause it to throw up the green scum. The water found on the 2000 level of the Julia appears to be of the same kind.—*Territorial Enterprise*.

FIG. 2. SECTIONAL VIEW OF RIGBY GOVERNOR.

by a light spring that will open the main a little more than is sufficient to keep the engine at speed when running light. An elliptical pulley is also used on the main shaft for the governor belt, which gives a slight vibratory motion to the balls, thus tending to prevent the piston of the governor cylinder from going too far either way.

Mr. Rigby writes from Glenbrook that the sawmills are doing better than ever before, and cutting out about 200,000 feet per day of 12 hours, with three mills, one set of saws each. This is pretty good work. In two of the mills the power is quite limited, one having two engines 12x24, and the other one 16x20. The engines are made the most of by the governors above described, and where they are used a better power is gained than with the other engine (18x48) with another style of governor, all carrying steam at 95 pounds, and cutting off at about three-quarter stroke. The new governors

flesh is heir to. These springs are situated in Mono county, California.

NEW PAVEMENT FOR SLUICES.—The Eureka Lake mining company have purchased 45 tons of railroad rails to be tried as an experiment as "blocking" in their flumes in lieu of the cobble stones and wooden blocks heretofore used. Several of the hydraulic companies operating near the line of the Central Pacific railroad have for some time past been using the worn-out rails bought of the company for paving their sluices, finding them cheaper than wood or stone on account of their greater durability. The above is, however, the first instance that has come to our knowledge of parties buying rails to be used at so great a distance from the line of the railroad.

A COMPANY has been formed with a capital stock of \$340,000 to bring water into the city of San Jose.

A New Kind of Artificial Stone.

Messrs. Hopper & Evans, of this city, have applied through the Agency of Dewey & Co. for a patent combination of materials for the composition of artificial stone; an article that promises to come largely into use in the construction of buildings, roofs, floors, sidewalks, pavements, and the various other purposes for which artificial stone can be advantageously employed. The points of especial excellence claimed for this new substance are its imperviousness to water, resistance to heat, durability, healthfulness and economy. According to the description it does not crack with age or exposure to the sun, tends to preserve the wood and other materials to which it is applied, remains hard on exposure to heat, can be easily repaired, removed and renewed, and when put in place sets and hardens in a short time. On the assumption that it possesses the above properties, this article must speedily find favor with builders, artists, manufacturers, and the general public. For sidewalks and street pavements it will be very likely to supersede the use of asphaltum, as it can be made slightly yielding, thereby securing the advantages of that substance, while it neither melts nor cracks, its manufacture being attended with no smoke or disagreeable smell. The inventors will soon have their new stone on the market, such practical trials having already been made of its qualities as establish both its utility and cheapness.

THE ILL-ODORED WATERS OF THE COMSTOCK. —Assistant Superintendent Patton, of the Bonanza mines, has sent a demijohn of water taken from the bottom of the Ophir 1900 level winze to San Francisco for analysis. It is supposed to contain minerals of various kinds leached out of the ore and rock of the vein. When it stands for a short time in the bottom of the winze—that part below the 2000 level being at present used as a sump—a thick green scum rises upon it. Its odor is very offensive. When a few buckets of it have been hoisted the exhalations from it load the air and sicken the men. Mr. Patton is of the opinion that the water, which is very hot, may be found to contain some silver, leached out of the chloride contained in the ore. Whether or no it contains silver it is of interest to ascertain just what minerals there are in it to give it an odor so disgusting, and to cause it to throw up the green scum. The water found on the 2000 level of the Julia appears to be of the same kind.—*Territorial Enterprise*.

NEW LAKE DISTRICT.—Concerning this district lying near Mono lake and now attracting some attention, the *Bodie Standard* says: The district is a little west of south from Bodie, and distant 55 miles. A wide porphyry and slate formation runs through the mountains, on the east and west sides of which the mines are situated. The rock appears to be very hard, and a peculiar feature is that high up on the west side of the bluff or mountain the ledges are all free milling ore, while those low down on the east are base metal. On the west are the Mammoth, Headlight, Grank Cash, Monumental, Dennis Kearney, Flying Cloud, Alpha and Jordan; and on the east, North Star, Ajax, Mono Lake City, Last Chance, Gazelle, Don Quixote, Silveropieris, Savage and Rice. The Mammoth and Headlight were recently purchased by General Dodge, M. Lambreth and others of San Francisco, who will put up a 20-stamp mill right away.

The largest solid gold nugget yet taken out of a Black Hills mine was lately taken from the bottom of the 20-foot shaft of the Consolidated American Flag Palmetto mine at Lead City. It had scarcely a particle of quartz mixed with it, and weighed 34½ ounces. The mine was some time ago bonded by New York parties for \$110,000.

The little steamer of Captain Holmes plying on Walker lake is a real success, and is doing a thriving business. At present considerable freighting is being done to the southern part of Esmeralda county, and nearly all of it is by way of Walker lake.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Mining in El Dorado County.

[From our Traveling Correspondent.]

A hasty run has just been made to that portion of the county lying between the South and Middle Forks of the American river. Many changes have taken place here within the past two years. Mines then worked now lie idle, some probably abandoned for years to come; while new discoveries and new developments have to some degree taken their place. Taken as a whole, the quartz interest may be said to quiet as compared with former years. The St. Lawrence, the Rosecrans, the Taylor, the Slinger, the Woodsie and several other once promising quartz mines, are all shut down; but the day will doubtless come when some of them will be reopened and worked with profit. More attention than usual has been given the past season to gulch and hill diggings. Many have made fine wages at points hitherto little prospected, and where the presence of gold in paying quantities was scarcely suspected.

Among the late sensations in quartz the Smith Bros., in the neighborhood of Greenwood,

Have found, from all accounts, a veritable bonanza. At any rate it is looked upon by the owners as one of the greatest discoveries ever made in the county. The ledge is reported to be 50 feet in width on the surface, the quartz carrying and showing gold from foot to hanging wall, and pretty evenly distributed throughout. It has been worked all the past winter, the quartz being wheeled out and the fine dirt sluiced, using eight inches of water, and it is said to have paid them handsomely, as high as \$40 being pounded out in a small hand mortar within a couple of days. This process being considered too slow, a 10-stamp mill is now going up under the supervision of Mr. H. G. Malthy, who is understood to have recently secured an interest in the mine. About 400 feet from where they are now at work and at a depth of 350 feet, the ledge crosses Georgetown canyon, at which point it is 14 feet wide and prospects equally well, from all of which it must be apparent that they have reason to be jubilant.

Mr. John Cedarburg has also made a quartz location recently about two miles from the old Cedarburg (of rich specimen notoriety) which bids fair to be of a more permanent character than the one destined to transmit his name to posterity.

The old Rice claim at

Spanish Dry Diggings,

Worked the past nine years by F. Ricci & Co. and always paying fair wages, is reported, just at this time, as doing splendidly. The gold is found in small quartz seams, which is a characteristic of the mines of this and some of the adjoining districts. The claim is very extensive, sufficiently so it is thought to give the company work for 75 years to come.

Mr. L. Sites has taken from one of his claims, the Pennsylvania, some rare and beautiful specimens of pure wire silver adhering to the gold or in close juxtaposition with the same, a fact so unusual for California, or even for the Coast, as to be thought worthy of mention.

Quartz at Kelsey.

The Ida Livingston, encased in talcose slate, is opened by prospecting shaft to depth of 80 feet. From wall to wall it may be four and a half feet, but somewhat mixed with slate which is highly charged with sulphurets carrying gold. The main body is fair milling ore, varying from \$12 to \$30, and some of it running as high as \$600 per ton—some of the richest of the vein matter consisting of tellurium. The mine is at present under the superintendence of Col. A. W. Burrell, and gives good promise of success.

The Chapparral, owned by Messrs. Poundstone, Condo and Leach, has resumed work. They have put up a whim and reached a depth of 80 feet, drifting south 65 feet on the ledge. The rock mills \$30 per ton. As soon as the mine is sufficiently developed to seem to justify it, a mill will be erected.

Mines Around Georgetown.

Immediately on the border of the town, Winslow & Co. are daily finding gold, from the decomposed quartz and occasionally a very fine specimen. They use the hydraulic and occupy ground from which between \$30,000 and \$40,000 had been taken from the surface. Their prospect is considered promising. Messrs. Judkins and Welden have recently purchased and are successfully working the rich seam and pocket claim which panned out so well last fall.

The claims at Georgia slide are doing a good average business, in fact it may be looked upon as one of the best districts in the county. Since the place was visited two years ago, Mr. S. Hausen has erected hoisting works run by water and sunk a perpendicular shaft 65 feet; drifting during the time 200 feet north along the ledge, in the meantime paying expenses. The whole of the rock as it comes from the ledge is crushed and has been paying him remarkably well the past two months—the yield for the last four weeks being about \$800. He

has sufficient ground prospected to last five years.

The Golden State,

On Jones' hill, four miles from Georgetown, has been opened to the depth of 150 feet by a tunnel and drift of 60 feet along the ledge, showing now a width of two and a half feet. Several small seams or feeders are found near the surface which appear to be approaching each other as they descend, giving promise of union at a greater depth. A five-stamp mill was erected many years ago, run by water, the money to build being supplied by pounding out the gold in a hand mortar, and the mine is represented to have paid from the start. The last crushing of only four days' run is said to have yielded nearly \$3,000. The mine is owned and worked by Messrs. Jones, Armstrong & Hall, and while putting money in the pockets of the company, is a great credit both to them and the county.

Volcanoville.

The old McGregory, a hydraulic claim, is run by Mr. M. D. Fairchild with a full force. A big blast lately did fine execution. Much is expected from it under its present management. The Volcano mining company are said to be running a drain tunnel which will tap the ledge at a depth of 400 feet from the surface. The New Year's company have taken out a small quantity of quartz near the surface that worked \$17 per ton. The ledge is two feet thick, the quartz looking well at the foot of incline 30 feet. They are now crushing some quartz taken out at this point, the results of which are promised you as soon as ascertained. More anon.

A. C. K.

Notes on Amador County.—No. 2.

[From Our Traveling Correspondent.]

The Keystone Con. Mine.

This property is situated at Amador City, two miles north of Sutter Creek, and is perhaps one of the most extensive and best paying gold quartz mines in the world. There are two shafts on the mine. The main working shaft is 815 feet deep, and the south shaft, distant 433 feet, is 550 feet deep. These shafts are connected by drifts on three levels, which keep the mine well ventilated and greatly facilitates exploration and ore extraction. The vein here bears the general characteristics of the mother lode, except that in this mine it is much wider than at most other points, being at one place 300 feet from wall to wall. Yield, about 100 tons of ore per day, which is reduced by a 40-stamp mill adjoining the mine. They use here 22 of Hendy's concentrators for saving the sulphurets, of which they clean up and send to chloridizing works about 50 tons per month, which yield on an average \$100 per ton. The cost of mining and milling the ore is about \$5 per ton. The gross yield \$16 per ton, besides the sulphurets. Bullion shipped last month, \$32,383.83. They have on their pay roll 120 men—wages, \$2.50 to \$3 per day. The company is incorporated in San Francisco, the stock being owned principally by Capt. James McDonald and A. B. McCreary. The whole business here is under the superintendence of Mr. O. C. Hewitt.

The Original Amador.

This mine, owned by the London and California mining company, is situated a few hundred feet north of the Keystone, being like it located on the mother lode. Six shafts have been sunk on the mine, averaging in depth about 800 feet. The mine is being thoroughly prospected, several levels of very good ore having been opened. There are two parallel veins lying close together, each so far having maintained its individuality. The hoisting power is situated 1,000 feet from one of the working shafts, and 700 feet from the other. The top of one shaft is 250 and the other 170 feet higher than the engine—the latter being at the foot and the shafts on the hillside above. By this arrangement a saving of about 40% in power is effected. Connected with this mine is a 40-stamp mill with all the modern conveniences for saving gold and sulphurets. The resident Superintendent is Mr. J. R. Johns.

The Bunker Hill Mine

Is situated on the same lode and immediately north of and adjoining the Con. Amador. The shaft here is 350 feet deep. Average width of ledge, eight feet; average pay of ore, \$12 per ton. This mine is owned by Wales L. Palmer, of Miners' foundry, San Francisco. It has a 10-stamp mill to which the ore is conveyed by a tramway. Six Hendy's concentrators are used to save the sulphurets. John Palmer, Superintendent.

The Gover Gold Mine,

Next in this series, is located about one mile north of Amador City, near the new mining town of New Chicago. The owners have put down one shaft to a depth of 750 feet, and are sinking another now down 600 feet. The average width of the ledge is about three feet, although there are places where it is much wider. A 20-stamp mill, 10 Hendy's concentrators, and all the appliances required for saving the gold and sulphurets have been provided. John Palmer, Superintendent, says the prospects of the Gover becoming a first-class gold-producing mine are good. This company is incorporated in San Francisco.

The North Gover,

Adjoining the property just described, has just

commenced prospecting the ledge. Shaft down 170 feet. Hoisting works just erected are run by water power. The company is incorporated in Amador City, where all the stock is owned; R. M. Ford, President. The stockholders seem to feel that they have a good property here.

California Potosi.

This mine is situated about half way between the Gover and the Phenix, and was formerly known as the Potosi. It was located and worked more than 20 years ago, but for want of capital to put up the necessary machinery was permitted to lie idle by the owners until 15 months ago, when it was purchased by the present Superintendent, John Tregloan, at a cost of \$18,000. The company is incorporated, and 15,000 shares of the 65,000 of which the capital stock consists, has been set aside as a working capital. This was afterward sold, realizing \$14,000, which was invested in a first-class 10-stamp mill, just completed, and furnished with Hendy concentrators, Hendy feeders and a quicksilver saving apparatus. The mill is run by 35 inches of water, under a pressure of 300 feet—Knight's water-wheel. Of the concentrators and feeders Mr. Tregloan speaks highly. The hoisting is now done by steam, but it will soon be changed to water power, using Knight's double water-wheel, with two nozzles, enabling the engineer to shut down or reverse as quickly as with a steam engine. To lead the water to the mine and mill 2,000 feet of 15-inch boiler-iron pipe is used. The ore-car is taken as it comes out of the shaft by the engineer, who is also dump tender, and rolled to the mill, a distance of 200 feet, and emptied into the ore dump, which serves also as a hopper to the feeders, thereby saving one hand. The working shaft here is down 250 feet, run in the foot-wall or slate, 20 feet west of the vein; size, 8x4½ feet. Quite a number of drifts and crosscuts have been run, exposing a large body of ore, which will mill from \$6 to \$8 per ton. They expect to mine and mill 18 to 20 tons per day.

Phenix Mine and Mill Company.

This property, owned by Alvinza Hayward, is situated at the town of Plymouth, Amador county, and contains 1,900 feet on the mother lode. It is worked and the ore raised from two shafts, 300 feet apart. The south shaft is 1,100 and the north 1,230 feet deep. These shafts are connected underground by drifts at the 900, 1000 and 1100 levels. The average width of the ledge, in three drifts south from the south shaft, is 33 feet. At the 1000 level and 280 feet south of south shaft, the ledge, in face, is 42 feet seven inches wide. At the 1100 level, 115 feet south of south shaft, the ledge in face is 33 feet wide. The mine is substantially timbered with round pine and hemlock timbers, 16 feet long and from 16 to 30 inches in diameter. These timbers are floated down from the mountains through the canal, which supplies water to run the mill. This canal is taken out of the north and middle fork of the Cosumnes, about 25 miles east of the mine, and furnishes an abundant supply for the mill as well as water to irrigate the gardens and orchards in the town. The amount of timber used in this mine is very great, the immense piles of logs now at the mine reminding one of the log-yard of a saw-mill. They are raising here and milling about 110 tons ore per day. They use two National rock drills in this mine, worked by a double-cylinder air compressor, these drills having proved a great saving as well as a great success. The mill is under the superintendence of Mr. Charles Green, and the mine of W. T. Jones. The mill contains four sets of batteries of 20 stamps each, supplied with Tulloch's feeders. The gold is saved by amalgamating in the batteries and by the usual number of copper plates. The sulphurets are concentrated in long sluices, with riffles, and by six Cornish buddles, situated along the line of the sluices. These buddles are run by undershot water-wheels, placed in the tail-race from the mill. The sulphurets are taken from the buddles almost perfectly clean and assorted by skimming off the top of outer edge of the pile in the huddle, where the larger and heavier particles lodge. These sulphurets, which they denominate No. 1, will assay \$175 to the ton; No. 2, from \$100 to \$150. This mill is run by water-power, 500 inches under 80 feet pressure acting upon two of Leffell's 20-inch water-wheels. The production of bullion is from \$35,000 to \$40,000 per month. The mine and mill give employment to 105 men, the most of whom have families and live in handsome cottages in this pleasant village, their homes being surrounded with fruit and shade trees and beautified with flowers.

Bisulphid of Carbon.

[By Prof. L. LANSZWEERT.]

EDITORS PRESS:—Twelve years ago, having been severely victimized in the manufacture and use of this deleterious and explosive compound, I availed myself of the columns of your valuable paper, and on the 27th of January, 1866, appeared the first article of a monograph on bisulphid of carbon, which if you would have consulted would have saved you the expense of drawings of Peroncel's furnace and reference to *Dingler's Journal* in a recent number. The SCIENTIFIC PRESS of 1866 contains more details about this article and I must confess that since that time hardly any improvements have been made in its manufacture, although perhaps more in its rectification and application or uses. As this subject seems to attract some attention de

novo on this coast for the destruction of the phylloxera, rats, squirrels, and, in connection with the carbon motor, the following remarks to complete till date my monograph may not be amiss to some of your readers.

Galy, Cazalat & Huillard furnace (see MINING AND SCIENTIFIC PRESS of January 27th, 1866), would certainly be perfect if the combination of sulphur with carbon did evolve heat. Unluckily it is the contrary, heat being absorbed which necessitates the repeated renewal of air. Explosions don't take place, as the vapor of the bisulphid of carbon inflames before its mixture with the air, but a large quantity of sulphur is lost or only utilized as combustible. For these reasons perhaps that furnace is not in general use. Let us refer to the primitive apparatus, the ameliorations gained and its defects at the present state. If at the beginning clay retorts were generally used it was due to the over-estimated temperature necessary to the production of sulphid of carbon. The cast-iron retorts now universally used have 50 to 75 millimeters thickness, and when they are well sealed in the wall last several months, so that a retort weighing from 1,000 to 2,000 kilogrammes will produce over 20,000 kilogrammes of sulphid. During the operation the retort expands considerably, and is nearly transformed into a sulphid of iron, slightly soluble in diluted acids. If the sealing is not properly done, and the iron of poor quality, the retort will last only a few days. The size, form, and the number of retorts have been modified; retorts one meter of diameter and more than two meters high have been used, and from one to four have been sealed in the same wall; always in a vertical position; sometimes inclined, but never horizontal. The diameter should not be too great, not over four decimeters, as the temperature on the periphery would be too great and detrimental to the center; it would therefore be better to use the elliptic form, as described by Gerard, of Grenelle, in 1859 (see PRESS of January 27th, 1866).

The trials made by covering externally and internally cast-iron retorts with fire clay has not given satisfactory results, as the expansion of the iron is considerable, the clay infallibly must crack; perhaps enamelled iron retorts or of good plumbago would be more lasting. The present mode of manufacture necessitates further improvements not only for a larger yield, less expense in combustible, the avoidance of the rapid deterioration of the apparatus, but also for the salubrity of the laborer. The most notable feature since 1866 is the introduction of sulphur in the retorts, not in solid or liquid state, but in vapor.

As the charcoal and coke used are neither pure carbon, but, besides their ashes, contains oxygen and hydrogen, several foreign products are formed, specially sulphureted hydrogen, which lessens the production of sulphid of carbon, as it takes part of the sulphur, but emanates also charged with vapors of sulphid of carbon. This mixture is one of the most disagreeable to the laborers and neighborhood. The absorption of this gas by hydrated lime, proposed by Deiss, has not given satisfactory results. Not only sulphureted hydrogen, but other volatile products, which add to its nauseous odor are produced. The quantity of these gases augments in proportion to the oxygen, hydrogen and humidity contained in the coals, thus it is advisable to dry them before using them in the retorts.

The sulphid of carbon obtained, as already stated, is never pure and the crude article is seldom used. It contains 10% of sulphur, sulphureted hydrogen, besides other impurities formed by combination of the carbon, sulphur and oxygen, the presence of which is proven by the abundant evolution of gas during distillation and the loss in sulphid of carbon, which is 25%. By a simple distillation, even in redistilling the product 20 times, we do not obtain a pure product, which should leave no residuum by evaporation.

Boniere for his spicy extracts passes the vapors through solution of hydrate of potassium, salts of iron and copper. Seyffert obtains a good product by precipitating the vapors with a fine spray of cold water. Deiss purifies by the distillation with sodium, chlorine, water and a solution of chloride of calcium. Sidot advises to agitate the rectified sulphid with pure mercury. Cloez agitates it with 1/2 of sublimated corrosive and 2% of colorless grease. According to a report by S. Commaillie, Millon's process of purification consists to distill the sulphid with hydrate of lime and to preserve it on copper turnings, but Wittstein did not obtain satisfactory results with this process. A very pure sulphid is obtained by distilling it several times with pure oil. As long as the purification is not completed, the oil conserves a disagreeable odor and is charged with sulphur.

In your issue of June 1st, 1878, you say "Even the pure vapor is an anesthetic as powerful as chloroform, but the crude vapor, containing many other substances and possessing a very disagreeable odor, is a powerful poison, especially to all the lower animals." Relatively to these properties opinions are very much at variance. Richter, according to his experiences, considers the sulphid of carbon as little injurious to health, but others, with your humble servant, has recognized its dangerous attacks on the system in the most manifest manner. The most of those who respire during a certain time in an atmosphere containing vapors of sulphid of carbon, suffer of headaches, nausea, pain in the lower extremities, and finally a weakness of the physical and intellectual forces;

Continued on page 390.

MECHANICAL PROGRESS.

Wire Ropes and their Fastenings.

The increasing use of wire cable in mining and mechanical operations on this coast, makes investigations concerning them of much interest. A paper upon this subject was lately read by Mr. Gibson before the English Institute of Colliery Engineers, and therefrom we draw records of various experiments. Mr. Gibson says: I have come to the conclusion that the best quality is the cheapest in the end. I must confess that underground hauling ropes are liable to be damaged through due care not being taken. Then comes the question of the best ropes for that purpose. The difference of quality I have found to be very great indeed. We have upon our apparatus ropes which have been working 19 months; formerly we could only get ropes to last six months at the most, and some not more than four. The difference of cost is also remarkable. The rope working 19 months cost £110 per ton; the other cost £52 per ton. At Monkwearmouth colliery they have introduced flat steel ropes, and have taken about 25 cwt. off the weight; and I understand they are working very well. The size of the rope taken off at Monkwearmouth was the same as we have at Ryhope, viz., an iron rope six inches by three-fourth, weighing 40 pounds per fathom. I find, from experiments made at the Sunderland test works, that we have a very large margin on hand. The rope I refer to is a charcoal iron rope, six inches broad, three-quarters of an inch thick, and weighing about 40 pounds per fathom. The breaking strain, as shown on the manufactory cards, is about 72 tons. From experiments made, we have ascertained that we could not put on the end of the piece of rope tested, fastenings to bear more than 50 tons, the piece of rope being 18 feet long. We also tested new ropes with the same results, that is, the rope breaking at the socket. We found that the plain socket with rivets, such as we have working, was the best. The socket is a plain, ordinary socket, with 18 rivets, one-half of an inch diameter. The socket is 16 inches long and 6 inches broad, and the rope made ready for it. An iron hoop, 1 inch by 5-16, is put round the rope and fastened with a rivet. The hoop is put on about eight inches from the end, and the wire ends are doubled to give stability. The test was began at 10 tons and increased up to 50, when the rope gave way in the socket near the end rivets. Other tests of rope the same size gave the same results. A fastening with two iron plates, but open at the end, gave way near the bent of the small piece of iron at the top of the plates. The fastening gave way at 45 tons. The breaking strain on the manufacturer's cards gives 70 tons. We also tested a rope which had been at work for 12 months. We cut out of the middle of it the part tested, and put sockets on each end. The test showed the rope to be good, as it broke at the socket the same way as the other. It gave way at a strain of 50 tons. Now all these tests demonstrated clearly, I take it, that we have not arrived at a fastening to break a rope. We also tested round steel ropes with the ordinary socket with rivets, and sockets without rivets; in all cases the sockets with the rivets gave the best results. A five-eighth inch round steel rope, with the ordinary socket put on with rivets, broke at the socket with a test of five tons. The socket was without rivets, and the rope was drawn through the sockets at a test of three and one-half tons.

PAPER MAKING IN ENGLAND.—A lecture was delivered recently by Mr. William Arnot, F. C. S., of Edinburgh, on the manufacture of paper, at the rooms of the Society of Arts, London. It was generally admitted, he said, that the process of paper making was introduced into England about the beginning of the 15th century, and into Scotland at the end of the 17th century. The lecturer gave some interesting statistics relative to the trade. The number of mills in Great Britain was 385, of which 65 were in Scotland. There were in these mills 526 machines at work, producing annually 350,000 tons of paper, to which must be added 10,000 tons made by hand. The total production was thus 360,000 tons, valued at \$100,000,000. The exports of England amounted to 16,000 tons, while she imported 24,000. With respect to the consumption of paper in different countries, Mr. Arnot stated that in Russia the annual consumption was one pound per head of the population; in Spain, one and one-half; Mexico and Central America, two; Italy and Austria, five; France, seven; Germany, eight; United States, ten and a quarter; and Great Britain, eleven and a half.

THE STRENGTH OF WROUGHT IRON.—A series of experiments has been carried on at the Washington Navy Yard, by Commander L. A. Beardslee, of the United States Test Board, to ascertain the strength of iron used in chain cables. It had been suspected, with just reason, that the British Admiralty tables for the strength of wrought iron needed revision. Not less than 2,000 tests of the tensile strength of iron have been made at the Navy Yard, to determine the elastic limit, elongation, and reduction of area of the various specimens; and 42 complete chemical analyses have also been performed. Some of the conclusions which have been reached are remarkable. The admiralty

tables are declared unsafe, and new ones have been prepared. The Board finds that the tenacity of two-inch bar for chain cables should be between 48,000 and 52,000 pounds per square inch; one-inch bar, between 53,000 and 57,000; and that stronger irons than these make inferior cables, because they have less ductility and capacity for welding. The strength of wrought iron and its welding power are influenced quite as much by the reduction it has undergone in rolling as ordinary differences in its chemical composition. In general, the processes for making wrought iron give an uncertain quality to the product, while the methods of making cheap steel confer certainty and uniformity. The ordinary practice of welding is capable of great improvement, by being performed in an atmosphere freed from oxygen. The importance of the subject will be conceded, since the safety of human lives must often depend upon the strength of a ship's cable, or of the links in a bridge chain.

GLASS MILLSTONES.—Die Muehle states that Herr Meissner, of Thorn, Germany, has invented a crystal glass millstone. The inventor was led to construct this novelty from observing that French burrs produced the best results when they had the closest and most glassy nature. The manufacture of glass millstones is pursued on the same plan adopted in building French burrs. Eight pieces of glass of equal size, containing nine cubic meters, are used as nuclei, the counter piece of granite being kept open at the hole and bound to the outer form with cement. The furrows are cut with knife-picks and the dressing done with pointed hammers, though the inventor recommends the use of a diamond dressing machine. It is claimed that these glass millstones do better work than French burrs, running more easily, grinding cooler and producing finer and lighter flour. Thus far, only a few pairs of these novel stones have been put in actual use.

COAL LIFTER.—A very simple and effective apparatus for transferring coal from vessels to coal sheds, called an automatic railway, has lately been put in operation by a coal firm in Albany, N. Y. It consists of a narrow track on a frame work close under the roof of the shed, having a gentle incline towards the outer end, on which a car carrying one ton runs by its own gravity when loaded and is drawn back when empty by a weight at the inner end of the track. The car is filled by a quarter-ton scoop and a hoisting apparatus worked by one man and a horse. By this means a ton of coal can be transferred from the hold of a vessel to the shed in one minute, and the service of eight or nine men and two or three teams for several days for each boat is dispensed with.

QUICK WORK IN A BOILER SHOP.—The Jackson (Mich.) Patriot says: Last Monday, John McIntyre, with helpers, Richard Whalen, Andrew Connor, G. W. Updyke and C. M. Rutherford, in the Central boiler shops, began on six new boilers, to show how fast they could do work in that shop. They flanged the 12 inside fire-box heads, six front and six back, in 22 hours and 10 minutes, the 24 short corners, each requiring a separate heat, being made in two hours 10 minutes. They also flanged the six large outside or back-end heads, which had 108 feet of plate, with a nine-inch flange, in 21 hours. The steel was Cleveland rolled steel, part half-inch and part three-eighth inch. This job of boiler-building has never been equaled, or, if it has, no one seems to have ever heard of it.

ELECTRIC LIGHT.—The question of using the electric light for railway stations and warehouses has been investigated by several foreign railway companies, with very successful results. A London exchange now says: Experiments were made in the hall of the new terminus of the Berlin Stettin railway, with electric light produced by the new rotation apparatus of Mr. Siemens. The results were highly satisfactory. The light was splendid. Six such lights would be sufficient to light up the whole enormous building, and each of them would only cost two pence per hour. An outlay of 5,000 marks would be necessary for putting up the gas steam engine to work the cylinders necessary for each light. All the railway managers in Berlin were present at the experiments.

LAYING OUT GEARS.—S. W. Robinson, of Illinois, sends the following note to the Polytechnic Review: In accurately laying out small gearing, fine and positive lines are required. Black lines upon white paper are not to be compared with brilliant lines upon a dead-black surface. To secure the latter in the highest degree, a zinc plate is washed with a saturated solution of sulphate of copper in water, with one-tenth nitric acid. The zinc plate turns black immediately and forms a beautiful surface to lay out work upon when exceedingly fine lines are required. This process, so far as I am aware, is due to Mr. Oscar Beal, of Providence, R. I., examples of whose work I have had the pleasure of examining.

TO TURN CHILLED IRON.—At Lister's works, Darlington, England, some articles required turning in the lathe, and cast-steel could not be made hard enough to cut them. One man proposed cast-metal tools. He was laughed at, of course, but this plan had to be tried. Well, cast-metal tools were tried, with points chilled, and they cut when cast-steel tools were of no use. The article was turned up with metal tools.

SCIENTIFIC PROGRESS.

Chemical Geology.

One of the leaders in the foundation of the "new chemistry" is Prof. Thomas Sterry Hunt. During the quarter of a century he has labored in this field, he has done signal service in developing this science and in elaborating the beautiful theory which is now its ruling idea. In addition to this interior work, as it might be called, in the science, he has led in the advancement of chemistry as a handmaid of geology, and in doing this he has led the thought of the day to the acceptance of now and well fortified theories concerning the majestic forces which have given us the earth as we now find it. In view of these facts we deem it a matter of great satisfaction that Prof. Hunt has collected the results of his ripened scholarship and given us a volume of "Chemical and Geological Essays," which is a revision and expansion of his former work on this subject. It is published by S. E. Cassino, of the Naturalists' Agency at Salem, Mass. In a volume of about 500 pages, Prof. Hunt presents the advanced science of chemical geology; embracing the theory of igneous rocks and volcanoes, the chemistry of metamorphic rocks, the primeval earth, the origin of mountains, the chemistry of natural waters. He also presents points on dynamical and historical geology, notes on special rocks, the origin of metallic deposits and defines a work, in which he stands altogether pre-eminent, the tracing of the origin of crystalline rocks. In conclusion he gives chapters which demonstrate the leading theories in the new chemistry more clearly, concisely and conclusively than we have ever read before. Prof. Hunt's work will stand as a fitting monument to American scientific progress in the fields in which he has labored, and it is a progress of which every American can be justly proud.

DETECTION OF MINERAL ACIDS.—At a recent meeting of the English Chemical Society a paper was read "On the Detection and Estimation of Free Mineral Acids in Various Commercial Products," by Peter Spence and A. Esilman. The method, says *Iron*, is based on the fact that peracetate of iron, even in dilute solutions, has a distinct yellow color not perceptibly altered by acetic acid or solutions of persulphates, but instantly bleached by free sulphuric, hydrochloric and nitric acids. The solution is made by dissolving 10 parts of iron alum and 8 parts of crystallized acetate of soda, in 1,000 parts of an 8% solution of acetic acid (25%). The method is especially suited for alum cake, salt cake, etc. Two hundred grains of the sample are triturated in a mortar with the 8% solution of the acetic acid, and the peracetate solution added until the mixture has a decided yellow tint, showing that all the free acid has been neutralized. The liquid is then diluted to 100 measures with the acetic-acid water, and a portion filtered into a test-tube. In another test-tube as many measures of the peracetate solution as have been used for the above liquid are diluted up to about 80 measures of the acetic-acid water. Standard sulphuric acid is then run in until the color of the liquid is the same as that of the 100 measures in the first test-tube. The quantity of acid used is the measure of the free acid in the cake.

LIMIT TO SIZE OF TELESCOPES.—In a recent lecture, Prof. Benjamin Pierce, of Harvard University, adverted to the difficulties that attend the use of large telescopes. According to a report in the *Tribune*, he thinks that the instrument at Cambridge (15-inch refractor) has proved richer in results than the one at Chicago (18½-inch) or the Naval Observatory telescope (26-inch). Atmospheric disturbances interfere most with the larger instruments. There are only two or three nights in the year when the Cambridge telescope can be used to the best advantage, and Prof. Pierce thinks that a glass of 10 or 12 inches is more serviceable than a larger one. He is reported as saying that a good night for the Washington telescope can not be expected more than once in three or four years. If much larger instruments are constructed, they are not likely to be of service more than once in a century. These views seem exaggerated. It may well be doubted whether the moons of Mars or the companion of Sirius would have been found by means of the smaller instruments, though after the discoveries were made with the larger telescopes the faint objects were perceived and studied with inferior optical power. Perhaps as much depends, in the use of telescopes, upon the acuteness of vision and the industry of the observer as upon the size of the instrument, within certain limits.

GUNDLACH'S OBJECTIVES.—At the last meeting of the San Francisco Microscopical Society, a letter was read from Mr. Allan Y. Moore, of Tulare, in which he said: "I have recently resolved *surirella gemma* (dry) into longitudinal lines by a Gundlach's one-fifth objective (105"), with very oblique sunlight. That is almost too good to be true, isn't it? I have, however, a witness. The objective is owned by Dr. A. C. Stokes, of Trenton (N. J.), and is very good for the price, \$15." Mr. Ernest Gundlach has just, as we learn from an Eastern exchange, opened the manufacture of lenses on his own account, at Rochester (N. Y.), having broken his connection with another firm of opticians.

Measuring the Salt in the Sea.

At the recent meeting of the National Academy of Sciences at Washington, Prof. J. E. Hilgard, of the Coast Survey, described and exhibited an "optical ocean salinometer." The determination of the salinity of the sea at different depths and localities has become a matter of importance for scientific purposes. The difference of percentage of salt, away from the access of fresh-water streams, is so small as to be very difficult to measure. The ordinary areometer, which operates by floating, can not be delicately observed in a vessel which is tossing up and down at sea; having made a very good instrument of this sort, Prof. Hilgard is prepared to judge of its inadequacy. The suggestion has been made by Profs. Hassler and Gibbs that optical means could be used to meet the want. Prof. Hilgard showed an instrument made a long while ago with that principle involved. It was shaped like a sextant, which was expected to make it come handy to mariners; but in actual use it proved unsatisfactory. The new instrument is, in appearance, like a spectroscope with telescope attached. The sea water to be examined is poured into a triangular bottle, which takes the place of the prism in the spectroscope. Light is admitted through a slit made by covering with black vanish all except a narrow space in a lens, and a lamp can be placed before this slit, all parts being practically secure against shaking by the motion of a ship. Prof. Hilgard said that with this instrument a very regular scale of values had been attained.

PHOTOMETRY.—At a meeting of the Academy of Sciences in Washington, as reported by the *Independent*, Prof. Pickering gave a very interesting description of his photometrical instruments, methods, and work at the Observatory of Harvard College. He has certainly taken a long step in advance of any of his predecessors in the same field, whether we consider the accuracy and range of the instruments which he has devised or the number and value of his results. One of his newly constructed instruments enables him to compare accurately the amount of light given by a bright star with that of a little "companion" close to it; and that even if the larger star be not a star at all, but a planet. In the field of the telescope the brighter star is hidden behind a screen, which covers half the field of view, while the little companion is left in sight; and at the same time a much smaller telescope attached to the principal one brings in light from the larger star, forming a little image of it close by the side of the companion. By varying the aperture of the subsidiary telescope, by a simple mechanism, it is easy to make the image of the brighter star exactly like that of the faint companion, and then the ratio of their brightness is determinable, and that with surprising precision—certainly within 1%, even when one is 10,000 times brighter than the other, as is the case with Vega and its little companion.

NATIVE FLOWERS AND FERNS.—"The Native Flowers and Ferns of the United States," by Prof. Meehan, is published by Prang & Co., Boston, the well known chromo-lithographers. The work is to be issued in parts, each one of which contains chromo-lithographs of four plants and 16 pages of descriptive matter. The chromos are the handsomest specimens of floral portraiture we have ever seen. The drawing is botanically correct and the coloring is strikingly natural. The authorship being vested in Prof. Meehan, the distinguished editor of the *Gardener's Monthly*, carries its own surety of excellence far and wide. The first two parts, which we have examined with care, show the "spiderwort" (*Tradescantia virginica*), "three-flowered avens" (*Geum triflorum*), "yellow jessamine" (*Gelsemium sempervirens*), "hoary polypody" (*Polypodium incanum*), common blue violet (*Viola cucullata*), wood anemone (*Anemone nemorosa*), golden columbine (*Aquilegia chrysantha*), and American "thick stamen" (*Psychandra procumbens*). It will be seen by this enumeration that a wide range of our territory has already been called upon for native plants, and we believe the work is one in which the whole country will take pride.

EARTH DEPRESSION IN FRANCE.—A little village in the neighborhood of Draguignan, France, has, says *Nature*, lately been the scene of a remarkable subsidence, which has attracted the curious from all directions. An elliptical tract of ground, containing over 10,000 square feet, sank gradually one day, accompanied by loud noises, until it left an orifice of over 100 feet in depth, with water at the bottom. Numerous trees and vines disappeared completely in the depths of the new lake. A similar depression on a smaller scale occurred in the same vicinity a century ago, and both the phenomena are attributed to the action of subterranean streams.

THE ENTOMOLOGICAL REPORT.—We learn from an Eastern exchange that Prof. Riley, the Government Entomologist recently appointed to the Agricultural Department, has been engaged during the present week on the last pages of his report, as chief of the Entomological Commission under the Hayden Survey. The brief paper upon the subject read by the Professor before the Academy of Sciences, which recently met in Washington, attracted an attention which gives proof of the interest of the forthcoming report.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

THE MINES.—*Ledger*, June 15: A rich strike has been made in the Moore mine, and the erection of a mill has been determined upon. The Lincoln mine continues to pay handsomely, though the last few runs have not yielded so largely as when the extraordinary rich ore was crushed. S. D. R. Stewart has a lease of the mine for three years.

THE MONTEREY.—They had another clean-up here a few days ago, which resulted in a much better yield than the first, showing that the mine is gradually improving as they go down.

ABOUT PLYMOUTH.—The Potosi mine is still being worked, though "tied up." It is a fine property. The old Seaton mine has been "jumped," and workmen are engaged thereon. The Phenix is running with its usual good luck.

CALAVERAS.

SLITER & HOEY.—*Chronicle*, June 15: They have completed their five-stamp cement mill in "Old Woman's" gulch. It will be run with an eighty-foot, overshot hurdy-gurdy, the water having a pressure of 290 feet. The gravel prospects first-rate, and there is every probability that the mine will pay well when the battery is set in motion.

GWIN MINE.—Sinking the shaft here progresses steadily and rapidly. The present sinking is to include 150 feet, instead of 100 as usual, for the reason that the shaft will then be as deep as it will be possible to sink with the present hoisting works. The next level will be the 1550, and when it is completed the mine can boast of 150 feet of "backs," on a pay chute exceeding 300 feet in length, and a ledge from six to nine feet in width. The next level and stopes will probably yield a colossal fortune. A clean-up was lately made in the Emerson hydraulic, Happy valley, after a run of considerable duration. The yield is understood to have been large. Hoisting works are to be put on to the Whisky Slide mine, Jesus Maria district, immediately. A shaft has already been sunk on the mine to a considerable depth, and as soon as the hoisting works are in readiness work will be recommenced with vigor.

EL DORADO.

SOLD TO THE CHINESE.—*Mountain Democrat*, June 15: A Chinese company purchased of Thomas Anderson, L. Landecker, and others, last Monday, a tract of placer mining ground in the vicinity of Cold springs. The sale embraced several claims, all of which had been worked more or less. One conveyance called for a payment of \$4,900, and another for a payment of \$400, making a total of \$5,300.

WORK IN PROGRESS.—The crosscut west from the 220 level at the Placerville company's mine tapped the old works, last week, at the distance of 18 feet. The immense body of water below the head of the tunnel poured into the shaft, filling the drifts and rising 20 feet above the crosscut. Since that time until Thursday last the work of hoisting it out has been going on steadily, and the mine is now free from water except a sump of 15 feet in the bottom of the old works. Explorations made show the timbering in the old incline—with the exception of four sets—to be in perfect condition. Prospecting will now be pushed vigorously above and below, and we hope soon to see a strong force at work on the stopes.

INYO.

LAKE DISTRICT.—*Coso News*, June 15: The Mammoth mine, situated about a mile and a half below Pine City, was recently purchased by Gen. Dodge and other parties of San Francisco. It has large croppings, which have been estimated to be sufficient, should the mine not go down, to keep 20 stamps crushing for 12 months. A tunnel has been commenced, which will have to be run 250 feet, tapping the ledge 300 feet below the surface. Gen. Dodge is expecting a saw-mill to arrive every day. A 20-stamp quartz mill has already been ordered. Work on the mill-race, to bring the water—a mile distant—to the mill site, has been commenced. The Alpha mine, Parker, Lowe & Co., owners, has been bonded to Riley Armstrong, Jim and Dave Lowery, of Gold Hill, Nevada. The tunnel is now in 185 or 190 feet. They expect to strike the ledge every day. There are other locations on the same belt, which are equally as promising, but not having as yet been worked to any extent. In Pine City and Mammoth, two rival towns, there are 75 or 80 cabins, a hotel, 30x80 feet, Saylor & Riddle, proprietors, one general merchandising store and three saloons. Some prospectors have recently made some very rich strikes of base metal mines, 12 miles south from Pine City.

EMIGRANT COMPANY.—Daniel Jones, after examining the property of this company, in Lee district, and consulting with Peter Taylor, the Superintendent, has concluded to move the mill and put in water works. The mill is still running on tailings, but in a few days will close down and make a general clean-up, preparatory to moving same to the mines.

MONO.

THE GENERAL OUTLOOK.—*Standard*, June 11: There has been, during the past week, a very marked improvement in several of our mines,

and the general opinion prevails that Bodie is on the up-grade. A ledge of unbroken ore has been cut in that mine on the 250 level, two and a half feet wide, which it is believed will average over \$100 per ton. This splendid strike is very encouraging, and cannot fail to influence the capitalists who have investments in our mining properties to keep straight down until they strike the bonanzas, which are undoubtedly hidden beneath our rugged hills. The Standard keeps up its regular supply of bullion; the Bechtel is showing a great improvement; there is an unusual stir about the Red Cloud, while they are taking out ore so valuable that they keep it in sacks; they are reported to have made a fine strike in Tioga recently; Black Hawk, McClinton, Belvidere, May Belle, Richer and indeed nearly all our mines are improving amazingly. The Syndicate mill is now working Bechtel ore steadily and will soon be crushing Red Cloud. The Miners' is crushing Black Hawk ore. Mr. Kalmus's new Sherman mill is arriving in pieces from Silver City. A location has been made, the ground purchased and graded and building will be commenced at once. The Sigourney mine, whose very flattering prospects have been published in this paper, has been bonded, and Col. O. R. Johnson has gone below to effect a sale. Bodie may now be considered fairly out on the second heat after a good rubbing down in the paddock, and with a full head of second wind on, she is going to win.

NEVADA.

SNOW POINT.—*Transcript*, June 17: The shaft here is down 115 feet and they are now running a 300-foot surface tunnel to drain the shaft. The tunnel will be completed inside of two weeks, and then sinking the shaft is to be resumed. It is expected that the bedrock will be reached at a depth of 150 feet from the surface. The bottom of the shaft is at present in gravel, which prospects far beyond expectations. Several other important mining enterprises are to be begun before long in that part of the county.

A deep tunnel, to be run by a large stock company, is talked of as the needed thing now for Grass Valley, to open up and drain all that region known as Massachusetts and New York hills, from below Allison ranch. Drained in this way, millions of dollars would be easily taken out by the simplest modes of mining, now out of reach by reason of water.

Work progresses and prospects improve at the Murchie, Pittsburg, Gold Flat, and, in short, nearly all the old standard mines about Nevada City, Grass Valley. Heavy work is being done on the Rocky Bar mine, from which the tributers are taking excellent ore.

RICH QUARTZ.—On Monday last a clean-up of 16 loads of quartz was made at the Allison-Franklin mill, from the claim of Mullen, McDonald & Ford, which yielded \$200 per load. This claim is adjoining the new Rocky Bar ground, and has been noted for the richness of the rock it produces. A number of crushings have been made from this ground, none of which have gone below the above figures and some have considerably exceeded them.

RELIEF HILL.—A correspondent of the San Juan Independent writes concerning this locality as follows: The Walkshaw company has struck a channel of rich dirt in their tunnel. Cleaned up \$3,000 lately. The Eureka company have some splendid ground and will take out coin this season. A company are running a prospect tunnel into the main ridge from the Relief hill-side and have got flattering prospects. The Penrose boys have got a good claim on the river and are making money.

PLACER.

RICH STRIKE.—*Herald*, June 15: A chunk of quartz, containing over 15 ounces gold, was taken from "Pike" Bell's mine, at Bald hill, last week. On Tuesday, \$5,000 were taken from this claim, and on Wednesday, \$2,000 was taken from one pan of dirt.

IOWA HILL.—The Orion mine is being put in good shape for profitable working. A large hydraulic pipe is being laid from Independence hill to the claim, three-fourths of a mile. This improvement, together with the flumes, undercurrents, etc., it is estimated, will cost the company \$12,000. Pipes, flumes and undercurrents will be rigged up for next season's work in the Independence Hill claim.

WASHING THE TAILINGS.—J. H. Neff & Co., having obtained possession of Indian canyon, a most valuable piece of mining property, will shortly give employment to quite a number of hands, blasting the falls, sluicing up, etc. What makes this ground so valuable is the fact that the tailings from a large number of claims leave their deposits here.

THE GIANT GAP.—At this claim, on the divide between Indian and Shirt-Tail canyons, a new pump and new machinery are being put up. During the winter the men were compelled to cease work in the incline, owing to the water. The new pump will obviate this difficulty.

THE EXCELSIOR MINE.—At Forest hill, a strong company, has its shaft down 50 feet, which will be continued a further depth of 400 or 450 feet to the bedrock. The contract for sinking it has been let to A. Steele. The engine and hoisting works for the mine arrived at Auburn Station on Wednesday. The machinery, it is expected, will all be set up in the course of three weeks, when operations will be actively begun. The mine is next the Sacramento claim.

SISKIYOU.

MINING ITEMS.—*Yreka Journal*, June 12: At the Pacific mine on Klamath river, near the

mouth of Humboldt, a dollar to the pan is realized from a hole now being worked under the bed of the stream, and the prospects are favorable for a vast amount of gold being taken out this season. Several of our citizens visit the Lucky Baldwin mining claim, at north side of town, every day lately, to witness the pumping by steam and other operations going on toward getting down on bedrock of the Yreka creek.

TRINITY.

BIG PAY.—*Journal*, June 15: Forty-three tons of ore from the Black Bear mine in Deadwood district, recently crushed in an arastra, yielded \$3,300. This district has yielded largely thus far for the amount of work done, and several of the lodes now being prospected promise to become permanent paying mines.

STILL ANOTHER.—Ritter & Co., on Eastman gulch, a few miles from Deadwood, made another fine clean-up in their arastra the other day. They took out 65 ounces, worth \$16.50 per ounce, aggregating \$1,072.50. This was the result from crushing 15 tons of rock, giving an average of over \$70 to the ton.

MORE GOLD.—Another clean-up was made in the Ward mine on Oregon Gulch mountain this week which resulted in taking out \$5,300. This makes over \$14,000 taken from this mine the present season and some more work will be done before the final clean-up is made. At present they are running about five hours per day.

MINING CLAIMS in Weaver basin have plenty of water yet, but it is not expected to hold out in many of them but a few weeks longer.

TUOLUMNE.

LIVE OAK.—*Independent*, June 15: This quartz mine, near Soulsbyville, on the same ridge with the famed Soulsby vein, was worked some 20 years ago and abandoned. It has now been relocated, under the above name, by W. G. Long & Co., who have retimbered the old shaft—some 40 feet in depth—put in a pump and erected hoisting works, both being run by steam power. They got the water out last Saturday, and from the ledge in the bottom of the shaft, which exhibits a vein three feet in width, knocked off specimens of the rock, which shows a high grade ore. It is heavily charged with very rich sulphurets, showing by assay as high as \$1,000 per ton. The rock assays \$42, and is estimated by competent judges to mill \$25. Some of it shows free gold. It is proposed to sink the shaft 100 feet deeper, and the work is now being pushed ahead. The company will erect a mill as soon as possible. The former owners stope out all the ore, north and south, down to the bottom of the old shaft—40 feet deep—which was drained by a tunnel. Below this they could not go without pumping machinery, which they were too poor to get. For some five or six years after this the location was kept good according to local laws, but was finally abandoned, as the old owners died off or left the county.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—*Gold Hill News*, June 19: Daily yield, 400 tons of ore. There is no change in either the quantity or quality of the ore extracted. But one mill, the California, is being run on the ore taken from the mine. The ore stopes on the 1200 level continue their usual yield of good ore. The western ore body on the 1650 level is opening up well, the ore being of an excellent milling quality. The ore stopes recently opened in crosscuts Nos. 1 and 2 on the 1750 level continue to yield rich ore. The north drift on the 1750 level from No. 2 winze is steadily advancing, the face still in rich ore. The south lateral drift on the 1850 level continues to advance without any material change. No. 3 crosscut on that level is steadily advancing and during the week has cut through a vein of fine ore, eight feet in thickness, which is supposed to correspond with the east ore vein found on the levels above. This ore is of a good milling quality.

CALIFORNIA.—Daily yield, 400 tons of ore. The ore stopes on the 1600 and 1650 levels continue to look well and yield rich ore. The extraction of ore and work on the lower levels is still very materially interfered with by the obstruction of the different currents of air, caused by the platforms used for repairing the Consolidated shaft. Sinking the joint winze below the 1900 level, on the north line, is making fair progress, the bottom being in hard blasting porphyry. On the 1750 level the repairs to the north drift from No. 5 winze are completed, and the drift is now being driven rapidly forward to connect with No. 6 winze. This drift thoroughly opens up the 1750 level, ready for the extraction of ore whenever it is desirable to do so.

OPHI.—At the bottom of the winze below the 1900 level on the ore vein, the west drift, recently started, and the east drift from the 2000 station of the main incline were connected on Friday evening last, greatly benefiting the air circulation in that portion of the mine. The south drift on this level from the winze station has been advanced 22 feet, nearly half the face of the drift having passed out of the ore into the porphyry on the east side of the vein. Fifty feet west of the ore vein at the 2000 station a drift has been started northward in the hard country rock. This drift is designed as the main north lateral drift of the 2000 level, and will be run in the country rock entirely on the west side of the ore vein.

SUTRO TUNNEL.—The face of the header is in easy working vein matter, composed of ledge porphyry, quartz and clay, allowing of a good

rate of advancement. The tunnel having already penetrated the great Comstock belt, and the face of the header being less than 300 feet from the west wall of the lode, it is liable to run into and connect with the workings of the Savage mine very shortly, perhaps before the first of next month.

SUCCOR.—A large air compressor is being built at the foundry, the foundations for the reception of which are already laid, and which will be in place and ready for use in a very short time.

SAVAGE.—The east crosscut on the 1640 level has reached the east clay wall, which has a dip at that point of 43° to the eastward. This drift, before reaching the clay wall, passed through 112 feet of solid quartz and low grade ore. The face of the drift has been stopped on account of the shocks created by the discharge of the blasts in the face of the Suto tunnel being so severe as to shake down rocks and make it very uncomfortable for the men working in the face. The face of the tunnel and this drift lacked only 120 feet, according to the best computations, of a connection one week ago, so that they must be much closer together now, and can probably be connected within a week's time if it is desirable to do so.

CON. IMPERIAL.—The opening up of the 2400 level is being pushed ahead in the most business-like and systematic style. Crosscuts Nos. 1 and 2 west from the lateral drift are in respectively 30 and 15 feet, the face of each being in vein porphyry filled with small streaks of lively quartz, all of which gives low assays of both gold and silver. These two crosscuts have been started for the purpose of testing the ore vein directly under that portion where the rich ore prospects were found on the west side on the 2135 level a year and a half ago, and will yet have some 75 or 80 feet to run to get under that ore body.

ALPHA.—The north lateral drift from the bottom of the joint winze on the 2400 level is now in 150 feet, the face still in a mixture of quartz, porphyry and clay of a soft, favorable character. Taking into consideration the known location of the ore-bearing portion of the vein as developed on the 2135 level, and the natural dip of the vein, it will be necessary to crosscut at least 125 feet to the westward from this drift to reach that portion of the vein where the best ore-bearing portion is expected to be.

JULIA CON.—The east crosscut, No. 1, on the 2000 level is advancing through a mixture of quartz, porphyry and clay of a very favorable character. This drift is now in a distance of 55 feet. East crosscut No. 2, from the main south drift on the same level, is also making good progress, the face in vein matter of a much more favorable make than anything yet developed on the 2000 level.

BULLION.—Sinking the main incline is making the best of progress, the bottom in porphyry mixed with quartz. This shaft is now down 167 feet on the inclination of the ledge, or about 100 feet perpendicularly below the 1840 level. The main north drift on the 2000 level is being pushed vigorously forward, the face in clay and porphyry, streaked with quartz which gives low assays.

BEST & BELCHER.—The south drift on the 1900 level is being pushed energetically ahead, the face having passed out of the heavy vein matter in which it was started into a harder and firmer character of porphyry, making a much better drift and requiring but little timbering.

GOULD & CURRY.—Sinking the main incline is going steadily forward and will be completed down to the 1900 level in a day or two more. As soon as the 1900 station is reached, a pump and tank station will be cut out and the main pumps lowered to that point.

CHOLLAR-COMBINATION SHAFT.—The depth now attained is 2,250 feet perpendicularly. The flow of water is 47,500 gallons daily, all of which is hoisted with the rock in the skeets. The shaft is now about 650 feet below the level of the Suto tunnel, where it passes that point.

CROWN POINT.—The south drift on the 2300 level, running to meet the north drift from the 2360 station of the joint Belcher incline, is steadily advancing at the rate of eight feet per day, the face still in porphyry.

YELLOW JACKET.—The north winze below the 2200 level is down 395 feet on the slope of the ledge; bottom in hard, dry material. This is the only work being done in the mine at present. The new shaft is down 1,520 feet.

BELCHER.—Sinking the main north incline shaft below the 2360 level has been resumed and is making good progress. The south drift on the 2160 level continues in porphyry and clay, carrying streaks of quartz.

SIERRA NEVADA.—The east and west crosscuts on the south line on the 2000 level are each being extended without any material or valuable change to note.

JUSTICE.—The east crosscuts Nos. 1, 2 and 3, from the south drift on the 1100 level have each penetrated the ore vein in part, and show it to be well defined, the quartz of a good quality, carrying many bunches and spots of rich ore. The working force has been reduced to 90 men.

OVERMAN.—The east drift from the 1600 station of main shaft is steadily advancing toward the ledge, the face still in hard, dry porphyry. The station at the bottom of the winze below the 1400 level is nearly completed, ready to start a drift back westward to meet the east drift from the 1600 station of the main shaft.

MEXICAN.—The new north lateral drift on the 1600 level is now in 283 feet, the face in hard blasting porphyry. This drift will connect in

about 10 days more with the old works, and then will form a fine base for crosscutting and prospecting operations to the eastward.

UNION CO.—Retimbering the north connecting drift with the Sierra Nevada mine on the 1600 level is making steady progress, the ventilation showing a steady improvement.

CON. DORADO.—The work of placing the machinery lately purchased from A. Sutro is going on rapidly, and preparations for sinking a three-compartment working shaft are being made. One thousand feet of rope was shipped from San Francisco a few days ago, and when it arrives the sinking of the shaft will begin.

UTAH.—The main south drift on the 1300 level has completed the connection with the Sierra Nevada mine, greatly benefiting the air circulation in that portion of the mine.

HALE & NORCROSS.—The water in the main incline shaft is being gradually lowered, the force of the flow being entirely overcome. Everything in and about the mine is in splendid condition.

CALEDONIA.—The face of the south drift on the 1400 level continues in good working ground carrying quartz with spots of ore. The north drift on the 1600 level is steadily advancing.

ALTA.—Opening the 1250 and 1350 levels and at the same time sinking the main shaft to attain a still greater depth on the ore vein is being pushed ahead with steady vigor.

ELY DISTRICT.

THE MINES.—Pioche *Record*, June 15: Raymond & Ely has made considerable progress during the last week in work relating to air compressor. Ore is coming up pretty rapidly from the upper levels of this mine, and is of good quality. Over 15 tons daily are being hoisted. The road to the Hillside mine and furnace is finished, and the work of hauling ore commenced yesterday. The mine still continues showing up in good condition, and when ready to receive at the furnace, will commence taking out a large quantity of ore. Are now taking out 14 tons daily from the top cut. The sinking of the Day winze is stopped; the other work in the mine is going on as usual. Where the winze was stopped, at the bottom, are drifting in a southeast course, with very good indications, the impression being that the ore lies in that direction. The ore stops 20 feet below the level of the tunnel are improving, the quality of the ore is also getting better.

DRY VALLEY MILL.—This mill is now doing some good work in working the tailings of the company. They are being worked so close that a profit of \$5 per ton over all expenses is made. The mill is turning out about \$16,000 per month in bullion from these tailings, generally about two bars per week. A bar came up yesterday valued at \$1,632.

CHRISTY BULLION.—The Christy Mill & Mining company shipped from Silver Reef, May 31st, one bar valued at \$891.58. This was the last shipment on May account. The total shipments for May amounted to \$25,916.58. The company shipped on the fourth instant one bar, valued at \$1,602.59.

EUREKA DISTRICT.

ABOUT EUREKA.—*Sentinel*, June 20: Wells, Fargo & Co. made the following shipment of bullion for the Richmond company this morning: Eleven fine dore bars, valued at \$22,742.23. This company is receiving shipments of coke from the Southern Colorado coke works, near El Moro, in that State, a distance by rail of 1,500 miles from this point. The new machinery at the Albion mine will be started up today. A large pile of ore is sacked up and attacked at the depot awaiting shipment to Salt Lake. Civil Engineer Robinson is getting up an elaborate map of the Jennie A mining property. The Eureka Con. incline has reached a depth of 100 feet below the 11th level. The double air compressor engine on the 9th level of the Consolidated is of sufficient power to hoist 3,000 pounds from a depth of 2,000 feet. The ore that has been stored at the Metamoras furnace for the past six months has been hauled to the Richmond works for reduction. A large lot of ore is being shipped from Tem Pahute district to Reveille district, the nearest point where there are milling facilities. About 30 men are employed working and prospecting in and around Tem Pahute. The recently discovered ore body in the Geddes & Bertrand possesses two important qualifications. It is an extensive deposit, and carries a handsome percentage of silver and gold. It is also developing splendidly.

Arizona.

SILVER DISTRICT.—*Sentinel*, June 15: This promises to become one of the chief ore-producing localities in Yuma county. This district is situated about 50 miles north of Yuma, on the Arizona side of the Colorado river. It has included in its boundaries that portion of the range of mountains lying between the confluence of the Yuma wash with the Colorado as the southern limit, and lighthouse rock as the northern. The general topographical features of the country do not differ materially from the base metal districts of Inyo county, Cal. The mountains have one marked peculiarity, viz., from a point, considered as the axis of the formation, the range faults from its general trend, bearing to the west, and becomes strictly a slate series; in this section are found the mines of Eureka district. From this point north they become granitic, and here are found the mines of Silver district. Bearing in mind the numerous failures of mining experts to properly estimate the value of mining properties, it would be worse than folly to attempt to do so in re-

gard to this district until it is more fully developed; but this much is assured, every foot in depth so far attained has shown a decided increase in the quality of metal. The veins show a marked degree of regularity, metal is found continuously on their surfaces as far as they are traceable, and the formation is favorable for permanency. The ores are not a clean galena, but associated with them are found carbonates with sesquioxide of iron. Smelting men, however, consider these modifications as benefiting constituents. Wide, open washes run from the river to the immediate vicinity of the mines, a distance of about four miles, affording natural wagon roads for transportation. Feed for animals on the river abundant the entire year.

Colorado.

NEW REDUCTION WORKS.—*Denver Tribune*, June 17: Prof. Hill is pushing the grading for his new and extensive reduction works at Denver, a tract of 80 acres having been secured for the site. The front will be 400 feet in length, and the buildings will run back a distance of 650 feet, covering about six acres of ground. The entire works will be in one enclosure, an immense stone wall eight feet high. The works will also be constructed, it is said, entirely of stone, and will therefore be most substantial and the walla proof against fire. Among the important departments of the works will be the ore-house, which is to be 452 feet long and 119 feet wide, besides an additional 92 by 36 feet for the accommodation of the boilers and engines, and for a sampling room and carpenter and blacksmith shops; the smelting-house, 283 by 64 feet, the repairing-house 286 by 62 feet, the coal-house 204 by 62 feet, and the office. The office will be 77 by 47 feet in size, and will be located about the middle of the front of the building.

Dakota.

MINES ABOUT RAPID.—*Journal*, June 8: The continued rains enable the sluice miners to reap a rich harvest, though they retard mill building and some other branches of business. Prof. Saunders gave it as his opinion that the Mineral Hill cement mines come from the Red Indian lode, which runs through the hill. The new comers—"tenderfeet"—are very successful as placer miners, starting in often and digging for gold where the more experienced would never think of looking for it. Business is lively and there are few unemployed men in Rapid at present. The hotels are well filled and population on the increase. Mining developments are also in rapid progress, this being just now the favorite part of the Hills with capitalists, millmen and others seeking interests in the mines.

Utah.

THE LEEDS MINE.—*Salt Lake Tribune*, June 15: The receipts of this property from November 1st, 1876, to May 1st, 1878, have been \$41,000 from the sale of stock as a working capital, and \$410,189.26 in bullion. The principal disbursements during the same period have been. For mine labor, \$91,000; mill labor, \$43,000; mill supplies, \$58,000; bullion discount and freight, \$52,000, and \$40,276 for the purchase of valuable mining claims adjoining, from which ore is now being taken. The company has distributed \$60,000 in dividends, and carry over a cash balance of about \$6,000. They own three valuable claims, a good ten-stamp mill and are free from debt. At the present market rate the stock is selling at about \$84,000 for the whole property—just one third its value.

THE FRISCO MINES.—The amount of bullion run out last month by the Bonanza company's smelter and the Frisco smelter amounted to 50 car loads, or 500 tons of base bullion, averaging 151 ounces per ton, making a total of \$75,500. Adding thereto \$4,000 run out in silver bars by the Frisco reduction works, it makes the round sum of \$79,500. The Shamtie smelter started up on the 23d of May, and has been running ever since, turning out about six tons of bullion every 24 hours. The smelter is running on raw Rebel ore and thereby saving the expense of calcining. The Albion reduction works have, after several weeks' work, leached out of the Bonanza ores, one silver brick, 800 fine, valued at about \$1,000. The Horn Silver mine, at a depth of 320 feet, is showing a large body of high grade ore, shipping to the smelters and reduction works. The Grampione mine is looking well, and no doubt will prove, after being developed, a second Bonanza. Plenty of men in the district for the work to be done.

MACHINERY FOR AURORA.—George Daly, Superintendent of the Real del Monte mine, Aurora, yesterday started out for his mine four 16-mule teams loaded with portions of the pumping machinery purchased of the Overman mining company. Several more teams will be started out this evening. In all there are 220,000 pounds of machinery to be removed. This will require about 16 teams of 16 mules each. One piece of machinery—the main spur wheel—weighs 24,000 pounds. Being cast solid it must go on one wagon. It is doubtful whether there is a bridge on the road that will support a weight so great. A sinking pump purchased of the Rock Island company, is included among the machinery that is being sent out. It is expected that the machinery will be ready to start up in about 60 days.—*Gold Hill News*.

The Peace Congress will be in session several weeks yet.

News in Brief.

THERE were 91 deaths in San Francisco last week.

THE German Emperor is considered out of all danger.

THERE are 40 pupils in the Art School of Design at present.

THE mobilization of Austrian troops is assuming larger proportions.

FROM reliable data, this year's wheat crop will be 400,000,000 bushels.

GRASSHOPPERS are raiding in Smoky valley, Lander county, Nevada.

LEGAL TENDERS are firm in San Francisco at 99½ buying, and selling at par.

THERE is to be a camp meeting at Calistoga Springs, commencing August 8th.

THE late dry weather has been disastrous to the potato crop around Point Arena.

THUS far about 15 whites have been killed since the Indian outbreak in Idaho.

THE preparations for the Dutch expedition to the North Pole are almost completed.

THE army worm is still operating among the crops in various sections of Inyo county.

THE estate left by George Craut, the English colonist in Kansas, is estimated at \$700,000.

THEY have had several lively earthquake shocks lately at Los Angeles—no damage done.

THE Colorado beetle is said to have appeared in two cantons of the French department of the Vosges.

THE condition of the Russian Empress is improving, and no more bulletins will be published.

A MOVEMENT is on foot in this city to form a colony in the Mexican States of Sinaloa and Sonora.

COL. FRED GRANT has been sent on an extended tour of observation in the Rocky mountains by Gen. Sheridan.

THERE is a heavy tide of immigration, mostly foreigners, flowing into the States and Territories of the far West.

THE late severe storms have killed most of the squirrels that infested the farms in Goose Lake valley, Lassen county.

THE purchasers of the Eureka Con. flue dust calculate that the 6,000 tons contain precious metals to the amount of \$250,000.

A PROJECT is on foot to build a narrow-gauge railroad between Eureka and Beowawe. The cost of the road is estimated at \$600,000.

A CHINAMAN afflicted with leprosy was recently placed by his countrymen on a sand-bar in the Sacramento river and there left to die.

IN New York City, during May, 95 business failures occurred, the liabilities being more than \$5,500,000, and the assets less than \$1,000,000.

JOHN TAYLOR, a young man, was killed at Avery's sawmill, near Emigrant Gap, Placer county, last week, by a heavy log rolling upon him.

THE stallion "Cognac," the man-eater, is now perfectly docile. His broken leg has been splinted and a mold of plaster of Paris placed around in hopes of saving the animal.

BECAUSE of the favorable news from Cuba, the Spanish government has granted an amnesty to all press offenders, and ordered the liberation of the Creoles imprisoned for rebellion.

THE levee on the lower division of Roberts Island has been completed. A considerable portion of the other large islands on the lower Sacramento and San Joaquin rivers is still under water.

THE Irishmen of Pittsburg (Penn.), and vicinity are raising funds to employ counsel for the defense of the five Granuhans and two Haggerty's, whose trial for the murder of Lord Leitrim in the County Donnegal, Ireland, begins at Dublin, July 25th.

AT Coal Creek, Ind., John Kelly, a miner, shot Thomas Mims, a colored miner, in the abdomen, inflicting a mortal wound. He then emptied the remaining loads of his revolver into a squad of colored miners, and wounded two of them. He was arrested.

THE funeral of Rev. C. C. Burleigh, the aged abolitionist, at Florence, Mass., was attended by 1,200 people. Local Unitarian and Congregational ministers took part. Among the speakers was Wm. Lloyd Garrison. Letters were read from Whittier and others.

F. C. FILEY, who was the poet at the Decoration day exercises in this city, died last week in the Home of the Inebriate. Through the influence of the ladies of the Blue Ribbon Brigade, he led an exemplary life for several months, but recently returned to his dissipated habits.

THE New York Socialist labor party have passed resolutions repudiating every endeavor to make that party responsible for any attempted assassination of the Emperor of Germany; condemning the capitalistic press of the country as inimical to culture and progress, and as against the spirit of the republic.

OF 75 meetings of operatives in the Black-hurn region (England), 50 have resolved to go to work at reduction wages, 21 not to resume, and four reached no decision. A large number of operatives throughout Lancashire have resumed work at the full reduction rates of wages, and the great strike is evidently near its end.

IN Gillet, Arizona, on the 12th instant, John Setright shot and instantly killed Sam Weir, without cause, when the citizens immediately lynched Setright. Colonel L. M. Taylor, a prominent citizen, was murdered at the same place and time, supposed to be by the friends of Jack Twillings, a notorious highwayman, who is now in custody. Colonel Taylor was an important witness for the prosecution.

EX-MINISTER WASHBURN is now visiting this State.

EX-VICE-PRESIDENT COLFAX and wife are on a visit to California.

THERE were 190 marriages and 76 births in San Francisco last month.

WIDOW MAGGIE VAN COTT, the Methodist revivalist, has reached San Francisco.

AN immense crop of alfalfa will be cut on the irrigated sage lands of Nevada this year.

CASES of insanity in Oregon have been more frequent in the past three months than ever before.

AT Virginia City, Nev., Cherry, the little daughter of Mr. and Mrs. Coleman, was drowned by falling into a tub of water.

THOMAS McDONALD shot and killed Alexander Nixou, at Bodie, in a drunken brawl. Nixou was President of the Miners' Union.

NINE men who had been found guilty of inciting a rebellion against the government of Chile, were recently shot to death at Valparaiso.

JOHN EDEN, aged 22 years, a native of Scotland, fell from the schooner *Vanderbilt* while heating out of the harbor the other day and was drowned.

CHINESE miners on the west coast of Vancouver's island are supplying liquor to the Indians, and two murders have already resulted in consequence.

AN Indian abducted a girl of seven or eight years old from the house of her sister, in San Benito county, but was pursued by two men and killed.

THE increase to the Mormon population of Utah has been at the rate of 20,000 annually, of which 10,000 were from Europe, and the balance from births, etc.

THE Senate Commerce Committee has reported favorably on Mitchell's bill appropriating \$50,000 for the construction of a first-class light-house on Tillamook Head, Oregon.

COL. JAMES FAIR, who is again suffering severely from rheumatism, has gone to the Steamboat springs in Washoe county, Nevada, to make trials of their curative virtues.

A SON of the late Lieut. George H. Derby, author of "Phoenician," and other humorous writings, and well-known among early residents of the Pacific coast, stands at the head of West Point cadets just graduated.

NUMA DUPERU, JR., 15 years of age, oldest son of Numa Duperu, of this city, while spending the vacation with friends at Noya, Mendocino county, fell from the cliffs while hunting sea fowls' eggs, and was drowned.

TWO privates of Company M, Fourth Artillery, fell off the tugboat *General Canby*, en route from Fort Stevens to Vancouver, on the 13th inst., and were drowned. A private who jumped after them was also drowned.

ON the 17th inst. a report received in Berlin from Vienna of a meditated attempt on the life of the Crown Prince Frederick William caused some sensation, and lead to the arrest of 130 Socialists in the German capital.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

RUBY AND DUNDERBERG CON. M. Co.—June 12th. Capital stock, \$1,265,000. Directors—B. S. Bernard, Robert Cunningham, Fred R. Corton, J. A. Jones and M. L. Stangrove.

BROWN'S BAR DREDGING AND M. Co.—June 13th. Directors—Benjamin Flint, C. A. Swain, S. D. Osborne, A. J. Severance and C. E. Buckingham.

SMITH G. M. Co.—June 13th. Capital stock, \$500,000. Directors—George W. Smith, Robt. M. Fryer, George Lauder, Louis G. Lauder and Silas W. Lauder.

PACIFIC G. M. Co.—June 14th. Capital stock, \$1,000,000. Directors—John F. Miller, C. A. Hooper, Robert Sherwood, Charles T. Bridge and W. E. Sell.

PHYLLXERA IN FRANCE.—According to French correspondence the war against the phylloxera increases rather than diminishes, and plans for combatting the insects abound. The Geneva alleged cure for destroying the devastating bug, where liquified sulphurous acid is employed, costs, with all accessories, about 16,000 fr. per acre! The Paris & Lyons Railway Co. declares it has full confidence in the use of sulphuret of carbon; the injunctious ought to take place at two periods, between December and March, and from the last week in May till the close of June. The company supplies the liquid 25 fr. per cwt. and will take back the barrels and injectors; it also furnishes the chloride of potassium, the tonic for the vines, at the rate of 12 fr. per cwt. This salt ought to be mixed with the ordinary manure, or with earth, and applied round each stem; 24 lbs. of the salt to 50 stocks. It is now established that the winged bug has a winter egg, deposited under the bark, adhering to the latter and never to the wood. Hence, the cure of barking the vines, when not too young. This treatment prevents the products of the aerial eggs from creeping rootwards in July, and does not affect the luxuriant vegetation of the vine. A special glove is employed to rub off the bark. Another enemy of the vine is the snail. This voracious predator is disposed of by powder, ing the leaves and stems in early morning with lime.

THE Rio Vista cannery is putting up from 700 to 1,200 salmon per day.

Continued from Page 388.

especially loss of memory. These symptoms become more intense if they continue to respire in the same atmosphere, and it has been observed that these persons who have once suffered from the effect of this agent conserve a great sensibility to its influence, even without the perception by smell of the presence of this agent, its presence is revealed to them by a peculiar sensation through the whole body, especially in the inferior extremities.

As antidote, solutions of carbonate of soda and of iron salts have been prescribed, but the surest way to guarantee the health of the laborers is to employ perfect hermetically-closed vessels and good ventilation in the factory.

Metallurgy in Benton.

EDITORS PRESS:—There are two mills in this place, the Comanche, 10 stamps, and the Diana, 5 stamps. Both were originally built to work the Aaron process, but, in consequence of a change in the character of the Comanche ore, that mill was afterwards adapted for roasting and panning. The Diana mill has never been changed. Operations here were, however, for a considerable time unsatisfactory, owing to the fact that the gentleman in charge did not understand the process.

In July last year the writer took charge of this mill, and since that time the average yield of the ore has been 95% of the silver contained, frequently reaching 98% when rich ores are worked.

The Value of the Ore in Silver
Ranges from \$60. to \$600 per ton, averaging about \$260. All the ore carries a notable quantity of copper, some of it as much as 40%, which I am sorry to say is wasted for want of facilities for saving it. I have thought of introducing the Hunt, Douglas & Stewart process (with modifications), but circumstances are not propitious at present.

The Fineness of Bullion Obtained
In this mill is from .860 to .980, and could be always up to the latter figure, but for certain reasons of convenience it is found better to get it about .900 fine. The bullion of the Comanche mill from roasted ore worked in pans is from .300 to .600 fine.

The Diana ore consists mainly of the mineral called partzite, the higher grades containing also a good deal of chloride, while the lower are mixed with ironstone.

The Process Employed.
In working these rich ores no "chemicals" are used except salt, as the decomposition of the native chloride by copper furnishes the chemical for the other silver compounds, and as this class of ore always carries an abundance of copper carbonates, iron, in proper quantities, is advantageously substituted for copper balls in the barrels.

Some time ago, being out of copper, I worked the rich ore entirely with iron borings, and the supply of this material being also exhausted, I set some boys to work to gather up empty oyster cans and other old tinware, which answered the purpose so well that I worked ore of \$400 per ton to 98% with them. The loss of quicksilver was for some months about equal to the weight of silver obtained, but I have succeeded in reducing it vastly.

An Element of Mischief.
In working the low grade ores, I found that they contained some substance which neutralized the chemicals to a very great extent, inasmuch that the expense was greater than that of roasting. As I knew that neither carbonate of lead, lime, zinc-blende, nor anything else that I was familiar with in this connection existed to any great extent in the ore, I was a little puzzled to account for the phenomenon, but an analytical investigation revealed the presence of an oxide of manganese mixed with the ironstone, which, by decomposing both the copper chlorides, on the presence of which in the pulp the success of the process depends, caused all the trouble.

Neutralizing It with Sulphurous Acid.
To obviate this difficulty I availed myself of the properties of sulphurous acid, produced cheaply by burning sulphur in a suitable furnace, and, by means of a pump, forcing the fumes into the pulp in a stirring vat, into which the pulverized ore is carried directly from the battery by an elevator and conveyor.

Besides neutralizing the injurious effect of the manganese oxide, the sulphurous acid has the advantage of forming, with the copper carbonate in the ore and salt, the copper dichloride required in the process, while it also seems to act, to some extent, directly on the silver compounds, forming silver chloride. From this preparing vat the pulp is transferred to the amalgamating barrels. As one pound of sulphur costs less than one pound of copper, which is the chemical heretofore used in conjunction with salt, and is chemically equal to eight pounds, the economy is apparent. I obtained a patent for this application of sulphurous acid some years ago. The pump used in forcing the vapor of burning sulphur into the pulp is constructed of wood (except the fastenings), with valves of rubber packing, and is arranged to operate directly upon water, and through the agency of the water, on the fumes.

I first attempted to make a strong solution of the acid in water, using the water to form the

pulp, but found that I could not get the water strong enough to work the more refractory ore, because the sulphurous acid made in this way (by burning sulphur) is unavoidably diluted with nitrogen and air, so that it would have been necessary to work under heavy pressure to make a strong solution, which was not convenient; but by injecting the fume into the pulp, where it meets with substances which fix the sulphurous acid, the latter is utilized with little loss.

C. H. AARON.
Benton, Mono County, June 9th, 1878.

A Cosy Cottage Home.

We give on this page a view and floor plans of a cosy cottage, which some of our beginners in the art of home making, or some of our more advanced readers who have small families, may find adapted to their requirements. It is a pretty little dwelling. It looks rather bare in the engraving perhaps, but with a windmill and barn behind it, and with the fore-ground nicely laid out and planted more freely with

A CHEAP ORNAMENTAL COTTAGE.

shrubs and flowers, it would soon grow into a little gem of a home. The design is drawn to aid those who have not the money to build large or more ornate dwellings, and it could be erected and finished for about \$1,000. The designers are Messrs. Isaac H. Hobbs & Sons, of Philadelphia, and they offer to furnish full working plans, as may be seen by their advertisement in another column.

The cottage contains three rooms upon the first floor, a parlor, a dining room and a kitchen, and there are three chambers with closets upon the second floor. The roof is so constructed as to admit circulation of air between the rooms. Above the ceiling of the upper floor there is an air chamber with ventilators in each gable. This helps to cool the upper rooms by allowing the passage of air beneath the roof while the hot sunshine is beating down upon it. The cottage is to be built of wood and to have a shingled roof.

The following explanation interprets the

First Floor.

Second Floor.

numbers upon the engravings, and gives the dimensions of the rooms: 1, vestibule, 3½ feet wide by 4½ feet long; 2, parlor 12 by 18 feet in clear; 3, living room, 12 by 18 feet; 4, kitchen, 15 by 18 feet; 5, back porch, 8 feet long by 15 feet wide; 6, a small entry, affording entrance to the living room, parlor, and to the stairway leading to the cellar. The second floor rooms are all private and are entered from the little landing at the head of the stairs. Nos. 7, 8 and 9 are the chambers; 10, 11 and 12 are closets, one to each room.

It will be seen that the little building has no waste room, but gives the inmates the full benefit of all the space. Although it is small the rooms are of good size. The style is unpretentious but it will hold a happy wife and babies and afford a spare room for a nice mother-in-law, and what more does a man need, anyway?

The aggregate number of shares changing hands at the San Francisco Stock Exchange during the month of May, was 1,848,845 shares, of which number Julia scores the highest, viz., 348,113, or the whole mine three times over.

The public debt was reduced during May \$3,070,198.

The Outlook in Montana.

At no time, says the *Independent*, for the past ten years, has the outlook for Montana been so favorable as at present. The abundant rains of the past three weeks assure a good supply of water for placer mining, agriculture and the successful navigation of the Missouri. As a consequence the miners will take out a great deal of money, the farmer will have good crops, and the merchant will be enabled to lay down goods at such low rates that the consumers will purchase at satisfactory prices. The prospects that there will be a good market at fair rates for all the products of the farm in the future were never before so good. The prices of stock of all kinds is steadily on the increase, and this will continue from year to year as our advantages of getting them to market are increased. The range is almost limitless and the business cannot well be overdone. Cattle can be raised here cheaper than in any other country. This seems to be as much the natural home of cattle, sheep and horses as are the great plains the home of the buffalo. The recent developments in prominent mines in all parts of the Territory

are abundant assurance of the permanency and wealth of our quartz mines, and has caused an unusual interest to be manifested in mining enterprises. New discoveries of a valuable character are being made almost daily, and others are being developed and worked with unwonted energy. We cannot now recall to mind a single mine that is energetically and systematically worked that is not paying well or will do so as soon as the proper machinery is put in place for reducing the ore.

The population is increasing somewhat slowly but surely, and those persons who have arrived this season appear to be an industrious and enterprising class, who have come to make this their home, and who have been allured here by the many advantages the country possesses for settlement, and not by wild schemes of speculation and hopes of sudden fortunes without working for it. But while the future is so bright we would again offer words of caution to those who contemplate coming here. There is

Our Telephonic Connection.

Our telephones are in constant and satisfactory operation, and the convenience of being able to communicate instantaneously instead of by means of the tardy feet of the messenger boy is past expression. We have a private line between our patent and publication offices, on Sansome street, corner of Pine, and our editorial and composing rooms, on Clay street. By means of the central system, devised by the American District Telegraph Company, we are able to have private conversation instantly with any one of the hundred or more firms or individuals named in the list below. All that is necessary is for us to call the "Central office" of the District Telegraph Company, at 220 Sansome street, tell them, through the telephone, whom we wish to speak to, and the connection is made at once. Thus each one of the firms named below can communicate with each other, through the joining of the circuits at the Central office. The American District Telegraph is entitled to great praise for devising and putting this system into operation. Already it increases the value of the telephone a hundred fold and there is no reason why it should not a thousand fold, as the list of telephoners increase:

BLACK VARNISH FOR COPPER OR WOOD.—In a large-mouthed bottle W. M. Ayres puts 500 grammes of methylated alcohol, and 90 to 100 grammes of pulverized gum lac. In another similar bottle he dissolves 90 to 100 grammes of powdered bitumen in 500 grammes of benzine. Shaking the bottles frequently, the solution is complete at the end of two or three days. The two solutions are mixed in equal proportions, and thickened to the consistency of cream with finely pulverized charcoal.

Mosaic Gold.

The so-called mosaic gold consists of sulphuret of tin— Sn_2S_2 , and forms fine scales of a gold yellow color, which can be sublimated at a moderate temperature without being decomposed, and which possesses a high degree of resistance to the influence of chemical agents. It has a peculiar fatty consistence, and is easily transferred to paper, etc. On account of this quality it is often used for bronzing frames, and as a gold color for printers' work. Mosaic gold can be made either by the dry or wet process. By the latter method a solution of chloride of tin is treated with sulphureted hydrogen gas, when a yellow precipitate of sulphuret of tin is obtained, but which is not remarkable for its fine color. The mosaic gold which is obtained by the dry process is far more beautiful. A great many regard this method as a very difficult one, but it is really exceedingly simple. The great art which must be observed in the preparation of this color is not to exceed a certain temperature, as otherwise a great proportion of the compound sulphuret of tin will be again decomposed by giving out sulphur into simple sulphuret of tin. To prevent the temperature rising over a certain degree, sal-ammoniac is used which body is evaporated at a certain temperature—any heat which is afterwards used is for the purpose of evaporating the salts. A little care is all that is necessary to interrupt the heating before all the sal-ammoniac is volatilized, and thus obtain a beautiful mosaic gold of a really gold-shining color. If too much heat is used a simple sulphuret of tin is formed, which has a gray tint, and this, of course, considerably detracts from the ground tint of the gold. Metallic quicksilver, or compounds of quicksilver, can be employed instead of sal-ammoniac, which also evaporate at a temperature below that which affects mosaic gold. The heating of quicksilver, or its compounds, must be carried on in glass retorts, on account of the poisonous nature of the mineral, and its costliness, as by this method the quicksilver can be recovered. This heating in glass vessels, however, requires great care, as their explosion might cause serious injuries. The quicksilver gives the most beautiful product, however, and is used where it is required to have a color which most nearly approaches that of gold. To avoid the dangers and losses which are inseparable from the use of glass vessels, an iron vessel is recommended. It must contain but one kettle, and have a broad rim, on which a cover in the form of the neck of a retort can be placed. By means of pipes this retort can be placed in communication with another room, in which the substances which have not cooled in the neck of the retort can be condensed. There are a great many recipes for the production of mosaic gold. We give some of the best ones, which have always given a good result: Tinfoil, 40 parts; sulphur, 35 parts; sal-ammoniac, 25 parts. The finest tinfoil procurable is put into a mortar with the sulphur and ammoniac, which must have been thoroughly mixed, and then subjected to a slow heat. As soon as the formation of vapors has ceased more heat is applied, but gradually, until a dark red glow is attained. The mosaic gold will then be found as a beautiful yellow mass, for the most part in the bottom of the sublimatory vessel, but partly also, as scale-like crystals on the sides of the vessel and the covering. Other recipes are: Zinc putty, 80 parts; sulphur, 60 parts; ammoniac, 30 parts. Or: Tinfoil, 45 parts; sulphur, 35 parts; ammoniac, 25 parts. —Translated for the *Jeweler from Handbuch für Farben-Fabrication.*

USEFUL INFORMATION.

Coking Bituminous Coal.

We have received a communication from Levi Stevens, of Joliet, (Illinois), concerning the coking ovens which he has patented, and which he believes will enable us to turn our bituminous coal into a coke which can be used to great advantage in making iron and for the reduction of other ores on this coast. The subject is certainly one of interest for what it claims, and we print the following points from Mr. Stevens on the subject: "The great difficulty in coking Western coal is the sulphur it contains. What- ever can be accomplished in coking it, the coke would be worthless if it contained too much sulphur. All Western coal has a large amount of sulphur in various combinations, at least three per cent. In coking, about one-half is carried off. The coal also loses about one-half of its weight; consequently a coke made from any coal will contain about the same percentage of sulphur as the coal from which it was made. A coke carrying 3% of sulphur would be of no value for smelting purposes. To get rid of the sulphur, before coking, expensive machinery has been employed to grind and wash the coal; by this means the sulphur, in combination with iron (pyrites), was taken out. This, however, disposes of but a small percentage. The larger percentage of the sulphur is not associated with iron, but with the lime and carbon in the coal, in such a condition that it cannot be separated by mechanical action. Another difficulty in making good coke from Western coal is, that while they are rich in bitumen, or hydrocarbon, they are hard and require a high heat to reduce them to a homogeneous condition. Before this can be accomplished the heat has expelled all the bitumen or hydrocarbon, leaving a spongy, friable mass, without the elements necessary to solidify it. By my process of coking this difficulty is overcome. The volatile hydrocarbons that are expelled in heating are returned to the coke from the same amount of coal in adjoining ovens, when it is in a condition to receive its bitumen and settle into a homogeneous mass. To get rid of the sulphur after the process of coking is completed, and before the coke is discharged from the oven, while the mass is at a high temperature I inject steam, heated to about 1,000° Fahr., at the bottom of the oven into the center of the coke, with sufficient force to permeate the entire mass of coke in the oven; under these conditions the steam is instantly decomposed without reducing the heat of the coke; the oxygen thus liberated takes up the sulphur and carries it off as sulphurous acid. These processes have been fully tested on several Illinois coals. If they had not, I believe they would commend themselves to scientific and practical men as sufficient to overcome the difficulties in coking Western coal. Wherever bituminous coal is found, coke can be made."

Manufacture of Lamp-Black from Natural Gas.

According to the report of the judges of group III, at the late Centennial Exposition, the manufacture of lamp black from natural gas is a prosperous industry in Ohio. As we have found natural gas wells in this State, possibly the information may be of practical value to us some day. The *Polytechnic Review* gives a summary of the report to which we have alluded. From this authority it appears that fine lamp-black has, for the past two years, been made at Gambier, Ohio, by the imperfect combustion of the natural gas. Two wells, yielding an abundance of gas, but no mineral oil, occur in Knox county, Ohio, near the junction of the Kokosing and Mohican rivers, which Mr. Peter Neff, of Gambier, has utilized in the extensive production of lamp-black, to which he gives the trade name of "diamond black." For the production of this black, the manufacturer has devised and patented several methods of burning the gas by a species of imperfect or smothered combustion. The simplest of these is an inverted burner, terminating in a hood or dome opening downward. The burner tube supplying the gas is brought down flush with the lower edge of the dome, and the gas, flowing downward out of the tube, imperfectly consumes and escapes uniformly about the edge, the separated carbon depositing itself on the nuder surface of the dome. Other devices for this purpose are in use, but could not be well understood without the aid of an engraving.

We are told that in the building of Mr. Neff there are 1,800 burners at work, consuming about 275,000 cubic feet of gas per 24 hours, which is about one-fourth of the available supply, the yearly product being about 16 tons of lamp-black.

The product is described as being very fine and smooth, free from any coarse and gritty particles and of an intense blue-black color. The absence of oily matter is shown by the fact that it readily mixes with water, in which particular it contrasts strongly with common lamp-black. It does not color either, and the liquid, when evaporated, leaves but a trace of residuum, while ordinary lamp-black, presumably from resin, gives a deep yellow solution, leaving, on evaporation, an orange-brown tar. By burning a quantity of the diamond black, scarcely an appreciable quantity of ash is left behind, and this little is probably derived from the scraping of the metal surface of the hoods.

Telephonic.

In a note to the French Academy, M. Brequet says that all the points of the telephone—the handle, the binding screws, the shell, etc., as well as the plate, may enable one to hear sounds. He demonstrates this with the string telephone. Attaching the string to any point of the Bell telephone, and using the parchment membrane, one may easily correspond with a person using a Bell telephone. Thus, by attaching several string telephones to a Bell telephone, several persons may hear the messages simultaneously. To render string telephones more practically useful, M. Brequet fixes to the center of the membrane two or several strings meeting there at an angle. The sound carried by one of them is propagated by all the others. A thread is also passed through the centers of membranes, which then serve as supports for long, straight lines. A sort of relay is also formed by means of a brass cylinder with two membranes, to which strings are connected. This method of extending the string telephone has been in use in this country for the past three years.

M. A. Demogot, of Nantes, estimates that only about 1-1800 of the sound which is communicated to the telephone is transmitted to the receiver. He considers that the muscular effort of the speaker is transformed: 1, into vibrations of the air; 2, into metallic vibrations; 3, into magnetic waves; 4, into electric induction; 5, into magnetic induction; 6, into metallic vibrations; 7, into vibrations of the air; 8, into vibrations of the auditory apparatus. If we suppose the loss of useful effect at each transformation to be equal, the loss would be comprised between two-thirds and one-half. This represents, very nearly, the experimental efficiency of pumps.

MAKING PAPER TRANSPARENT.—Artists, designers, decorators, architects, land surveyors, and all who have occasion to make use of tracing-paper, in their professional duties will be glad to know that any paper capable of the transfer of a drawing in ordinary ink-pencil, or water-colors, and that even a stout drawing-paper, can be made transparent as the thin yellowish paper at present used for tracing purposes. The liquid used is benzine. If the paper be damped with pure and fresh distilled benzine, it at once assumes a transparency, and permits of the tracing being made, and of ink or water-colors being used on its surface without any "running." The paper resumes its capacity as the benzine evaporates, and if the drawing is not then completed, the requisite portion of the paper must again be damped with the benzine.

A GREAT EXHIBITION IN 1879.—England has decided to have a great show next year. It will be an agricultural exhibition. The expense is estimated at \$150,000. The Lord Mayor of London has appealed to the British public for the support of the projected enterprise. It is to be under the auspices of the Royal Agricultural Society. Agriculture is declining in Great Britain, and there is some hope that the exhibition may arrest its downward course. The number of cattle and the acreage of wheat and other crops are decreasing, and very nearly one-half the population of the United Kingdom is now dependent for sustenance upon imported food.

ESSENCE FOR FUMIGATION.—Mr. H. W. Langbeck, in the *London Pharmaceutical Journal*, gives a formula for an essence suitable for saturating paper for fumigations: Oil of cloves, cinnamon, cedar, lavender and mace, of each half a drachm; oil bergamot, one drachm; balsam peru, essence of musk, of each half an ounce; tincture of tolu, 12 drachms; benzoin, three drachms; rectified spirits, 10 ounces. Dissolve and filter.

BISMUTH BRONZE.—A bronze which withstands oxidation and which is particularly suitable for the preparation of metal and lamp reflectors is made of the following: Copper, 52 parts; nickel, 30; zinc, 12; lead, 5, and bismuth, 1 part.

GOOD HEALTH.

Effect of Sea-Water in the Ears.

As it is the season for sea-bathing and the surf at the favorite resorts is full of swimmers, it is timely to talk of a possible ill effect of the salt water. If you don't wish to run the risk of becoming deaf, take a handful of cotton along with you, and when you go in bathing, put plugs of cotton in your ears. This may save you from earache and perhaps from more serious trouble. Dr. Samuel Sexton, surgeon-in-chief to the New York Ear Dispensary, in a recent communication to the *Medical Record*, estimates that a thousand people of New York city are sent to their physicians, to be treated for ear diseases, every year, whose trouble has arisen from getting water in their ears while bathing or from catching cold at such times by exposure or neglect.

It appears from the doctor's researches that salt water is peculiarly irritating to the delicate structures of the inner ear. Very cold water of

the freshest kind may, however, be equally harmful, and there is a short list of cases resulting from the Russian bath, two of the patients being themselves physicians. A few instances are cited where the trouble came from using the so-called "nasal douche," water having penetrated to the ear by the passage from the back of the mouth. But these are unimportant compared with those where trouble has come from salt-water bathing. In all of 65 of the last named cases inflammation occurred; in 57 it was acute. A variety of subsequent damages may accrue when the trouble spreads; permanent deafness is not among the least of these and life itself may be endangered.

Surf bathers are especially exposed to such injuries, since a breaker may strike them on the side of the head and drive the water into the ear; the same result may ensue if the bather gets a sudden mouthful from an unexpected wave, the water then being forced through from the mouth to the inner ear. Man, the doctor thinks, is not naturally amphibious. Animals fitted for aquatic life are provided with various arrangements for keeping the water out; seals, for instance, have a movable membrane in the ear, which closes and shuts out fluid. The muscles of the water-shrew are competent to shut the ear-passages. People who are blessed with very small openings of their ears run the least risk in bathing. A man should never dive, says the doctor, if he wishes to preserve his hearing. When in the surf, he should take the wave on his chest or back, "closing his mouth and nostrils;" though how a man can close his nostrils, the doctor does not state. But the pledget of cotton for the ears is essential and every bather should be provided with it.

Temperature and Light in Sickrooms.

William J. Larmer writes to the *Herald of Health* concerning the care of sickrooms. We quote a few paragraphs: In order to keep the various impurities from accumulating in dangerous quantity, each person in a room should be supplied with 3,000 cubic feet of air per hour; and this should be done, where possible, without creating a perceptible draft, for the nervous irritation induced by drafts is liable to produce internal inflammations.

The temperature of the sickroom should be kept at a uniform height, the best average being from 65° to 70° F., except for infants or very old people, who require a temperature from 75° to 80° F.; and for these it is especially important to guard against changes, and keep it as uniform as possible. All cases of fever require a temperature lower than the average, as from 50° to 60° F., to assist in reducing the high temperature of the body; but when the fever subsides, and there is much debility remaining, the temperature should be raised somewhat above the average. As a patient can hear a greater degree of cold when in bed than when out of it, convalescents from severe diseases, fevers especially, should have the temperature of their rooms higher than that maintained during the height of the attack. Diseases of the air passages, as croup and diphtheria, require a high temperature (80° to 85° F.) and a moist atmosphere. The best method for heating the sickroom is by the open grate fire.

The sickroom should not be darkened by blinds, except where there is disease of the eyes, with photophobia, or when the patient is very restless and cannot sleep, then strong light must be excluded. Otherwise the sunlight should be allowed to enter and act chemically by decomposing the noxious gases, and thus purify the air. Of course it is not advisable to place the patient under a strong, uncomfortable glare of sunlight, nor in summer to allow the sun's rays to shine into the room and raise the temperature too high. Artificial light has no useful effect, but does harm by burning up oxygen.

POISONOUS TOILET POWDER.—The *London Lancet* says that for some time past there has been an epidemic among young children in the neighborhood of Loudon, ending in many cases in the death of the child, and the disease presenting every appearance of erysipelas. A person whose child was thus attacked, suspected the violet powder in use in the nursery, and sent a packet to a firm of analysts for chemical examination. It was found to contain 25% of white arsenic. This poison, it seems, is unfortunately exceedingly cheap—at all events, cheaper than starch, of which violet powder is usually made. That the case was not an isolated one is proved by the fact that the analysts subsequently purchased several packets of powder themselves, and on analysis discovered the same poison in the same amount. Their analysis have, moreover, been confirmed by the medical men in the neighborhood.

THE HEART-BEATS OF A LIFETIME.—According to a French medical journal, Dr. Guyot, consulting the best authorities on the subject, and making the necessary calculations, has determined that the number of pulsations during the different ages of life are as follows: During the first year, 63 millions (in round numbers); during the first two years, 120 millions; during the first eight years, 435 millions; during the first 12 years, 614 millions; during the first 14 years, 698 millions; during the first 36 years (giving the figures in full), 1,229,904,900; during a life of 50 years, 1,928,160,000; during a life of 60 years, 2,269,800,000, and during a life of 80 years, 3,007,040,000.

NEW ADVERTISEMENTS.

Knight's Water Wheel, Knight & Co., Sutter Creek, Amador Co., Cal.; Yosemite Falls Hotel, John K. Barnard, Yosemite Valley, Cal.; Assessment Notice—Wide Awake Prospecting and Mining Company.

The Week.

The election held on Wednesday last to choose delegates to the Convention for revising the Constitution of the State appears to have been attended with a mixed result, a portion of the candidates of each of the several parties in the field having been elected. At present writing the details of results are no known.

The ingathering of a large hullion harvest and the good promise of the cereal crops are beginning to strengthen confidence in the future and to tell favorably on most kinds of business. Already trade and certain of our mechanic and manufacturing industries have experienced some improvement, and the reasonable hope is entertained that prices have touched their minimum, especially as regards public securities and real estate. Meantime, a protracted period of adversity has forced upon our people habits of greater industry and economy, the beneficial effects of which may be expected to last for a long time. The Indian outbreak in Idaho, though likely to prove more formidable than was at first supposed, there is reason to believe will soon be suppressed in view of the energetic measures being adopted to that end. A good deal of railroad construction is in progress in different parts of the State, consequent on the large amount of grain requiring to be moved this season. The damage to the reclaimed islands in the tule land districts proves to have been more serious than was anticipated, the most of them being again submerged by the high stages of water incident to the melting of the snow in the Sierra Nevada. Further attempts at their restoration will be abandoned for the present.

There were 1,900 passenger arrivals at San Francisco by sea last month, including 1,693 from China, and 912 departures, of which 254 went to China. For the same month last year the arrivals were 3,029, including 2,222 from China, against 1,270 departures, of which 449 went to China.

Going to Sonora.

As an effort is now being made in this city to form a colony for settlement in the State of Sonora, Mexico, it becomes the duty of the newspaper press to furnish the parties who contemplate emigrating to that country such reliable information as they may possess in regard to its natural resources and the inducement it may offer for settlement by the people of California. The proposed colony intend, it is said, to engage in agricultural, stock raising and similar pursuits. If so, the opportunities for carrying on either of these branches of industry, everything being kept in view, are by no means as good as in California, Oregon, Washington or almost any of our other Pacific States or Territories. Sonora, like California, has its wet and its dry season, but the average rainfall is much less there than in this State, the country being subject to extreme and long-continued drouths, some of which hold for two entire years in succession. No grain can be raised without careful irrigation, and water is everywhere scarce, especially so in the agricultural districts. When raised there is no market for grain or other farm produce at prices that an American would consider remunerative. This part of Mexico has been in the possession of the Spanish race for several centuries, wherefore all the arable land eligibly situated has been taken up and reduced to private ownership, the practice of granting to individuals large tracts of the public domain having prevailed there as in all other Spanish-American countries. The owners of this land appreciate it at its full value, and do not as a general thing care to part with it, being especially averse to selling it to Americans. It is doubtful whether good plow lands could be bought in the settled portions of Sonora as cheaply as the great agricultural valleys of California, and there is in that country no public land open for location as in this State. The climate of northwestern Mexico is not only dry, but except in the higher mountains, is hot and debilitating beyond anything experienced in northern or central California, foreigners who go there to live soon losing their energy and falling into the listless, shiftless habits of the native inhabitants. For raising cattle and sheep the country is better adapted than for farming, though inferior in this respect, ready market being kept in view, than regions further north.

For mining purposes this portion of Mexico offers better inducements; yet no one should go there to engage in this branch of business without a certain amount of capital. The vein mines of Sonora are, beyond any question, extensive and rich, the vast amount of bullion taken from them in times past furnishing ample affirmative testimony on that point. But the better class of mines like the choice farming land have become private property, and they too have been worked for centuries, the more available and tractable ores having in many instances been exhausted. The early miners worked great numbers of these lodes down to the line of permanent water, after which, being unable to drain them, they were abandoned. Subsequently the shafts and tunnels then excavated caved in, so that parties now starting in to work these lodes would be obliged to open them anew, requiring machinery for hoisting and pumping almost from the first. To transport machinery and supplies from the Gulf to the mines is a tedious and costly business, as the distance is considerable, and the carriage has in part to be made on the backs of animals. There is now lying along the mountain trails of Sonora much machinery packed in years ago but which never reached its destination, and of all the California companies who have attempted to operate them scarcely one has ever made a marked and permanent success.

There are placers in that country, but they too have been pretty well depleted of their surface wealth and can no longer be worked with profit unless water be brought upon them. In most cases there is little or no water to be had, and where it does exist it can be introduced upon the mines only through ditches to be constructed at considerable cost. It will be seen then, that there is little use of parties going to this section of Mexico with the intention of engaging in mining unless they have money or are in a position to command capital, as it may be required after they get there.

KNIGHT'S WATER WHEEL.—In our advertising columns will be found a card giving the localities where the Knight water wheel is at work at various places in this State, and the duty it is performing. The wheel has now been so long at work that it is no experiment, and the success it has accomplished is evinced by the number of places where it is used. It is claimed that a very high percentage of the power is utilized by this wheel, and its simplicity of construction will commend it to any practical man. One of our correspondents, who has seen the wheel in operation in many localities in Amador county, writes that it gives universal satisfaction.

CINNABAR, containing a high percentage of quicksilver, has been met with in the San Francisco sulphur company's mines at Rabbit Hole, Nevada, and the prospects are favorable for extensive deposits of the ore being found there.

The late Prof. Henry made 22 inventions, not one of which he patented.

A Feat in Photography.

Photographing a Horse while Trotting Forty Feet a Second.

We had the pleasure of witnessing on Saturday last the successful accomplishment of a feat in photography which has never been excelled, and which marks an era in the art, viz., taking a series of photographs of a trotting horse while at full speed, so as to illustrate the stride. A series of experiments with this end in view have been made by Muybridge, the photographer, at the instance of Gov. Leland Stanford, and the trial on Saturday showed how perfectly the work could be done. The experiments have been conducted at El Palo Alto farm, Menlo Park, where Gov. Stanford has established a stock farm for breeding thoroughbred horses, and where there is a fine track over which the horses could be sped.

Some five years ago Gov. Stanford asked Muybridge if it were possible to take a photograph of a trotting horse at full speed, but at that time it was considered impossible. About a year since, however, the experiment was tried and a photograph of "Occident" was taken while the horse was traveling 36 feet per second. It was a single picture, however, and excited more ridicule than praise, as most people thought the whole thing a humbug, not believing it possible for the picture to be taken, and not believing the position of the horse to be natural. This initiatory attempt has been followed up, however, until on Saturday last a series of 12 pictures were taken in less than half a second, while the horse was traveling 40 feet per second. These pictures illustrate the stride of the trotter precisely, and although they upset many preconceived theories and opinions, may be regarded as decisive. The method of taking the pictures is by no means complicated, and when once understood will be seen to be perfect, but several different ways were tried before a successful one was found.

On one side of the track a large screen is placed, and set at an angle of about 20 degrees from the perpendicular, the screen being covered with white cloth and having vertical lines formed across it 21 inches apart, which show black against the white cloth. The spaces between these lines are numbered from one to twenty in conspicuous black figures at the top. At the bottom is another low white screen with horizontal lines four inches apart, to show the height of the horses feet above the ground. Powdered lime was sifted over the track in front of the screen so as to make a perfectly smooth white surface, over which the horse was driven. On the opposite side of the track from the screen a low shed was erected, open in front, and on a bench or table were placed 12 cameras, numbered in order, so as to take 12 views 21 inches apart. These cameras were of English manufacture and constructed with an improved double slide, so that the exposure could be cut off instantly, one slide moving each way across the lens. The slides were held open by a catch connected with an armature in the side of the camera. A battery of eight jars was placed in the shed and each camera had an independent set of wires. These wires were led across the track under the ground until within two feet of the background or screen, where they were raised so that one of the sulky wheels would pass over and strike them. The wires corresponded with the vertical lines on the background, and as the sulky wheel passed over the wires the armature holding the catch of each separate instrument released the catch and the slides cut off the exposure of the camera at the instant, so that the photograph was taken without any blur. As the wheel passed over the different wires the different pictures were taken, each 21 inches apart, illustrating perfectly the stride of the horse.

The trotter "Abe Edgington" was brought out on Saturday, and after being warmed up a little over the track, after the apparatus was all ready, he was put to a 2:20 speed past the screen. He came down the track in splendid style, with a good, square motion and firm trot. As soon as the wheel struck wire No. 1, camera No. 1 was closed by the means described, and the first picture taken; when it struck No. 2 the second camera had the second picture, and so on until 12 pictures were taken 21 inches apart. The arrangement insured accuracy which was unquestioned. The horse was traveling about 40 feet per second and there were 12 distinct and separate pictures taken in a space of 21 feet, each in an inappreciable part of a second. The sound of the slides closing was like a continuous roll, so quickly was the feat accomplished. The negatives were perfect, without any signs of blur or indistinctness.

It would be impossible to describe the various positions of the horse's feet at different points of the stride, but there are positions which one would scarcely imagine, but which could not be questioned by those who witnessed the operation. At one point all four feet are off the ground, the two nearest being eight inches above it. Some of the positions are very curious, indeed, but one needs to see the photographs to appreciate them. Muybridge intends to mount the whole 12 on one card on a small scale, so that any one can procure them at Morse's gallery.

In photographing a running horse the wires could not be used in the same way for manifest reasons. Fine black threads were placed across

the track, 21 inches apart, and connected so that the armatures would release the slides as before. The racing mare "Sallie Gardner," a handsome animal, was brought out and the threads placed so as to strike her breast as she went by. The instruments were made ready, the signal given, and she came rushing down the track like a whirlwind. As the threads successively, by the means described, released the catches and closed the slides, the 12 pictures of the running horse were taken. When the mare broke the eighth or ninth thread she became aware of something across her breast, and gave a wild bound in the air, breaking the saddle girth as she left the ground. This gave a curious picture of the mare with her legs wildly spread and the broken girth swinging in the air just as it is separating. This series of pictures are also very interesting but difficult of description. They show, however, the gait of the running horse exactly, and in a manner before impossible. A long description even would be unintelligible, while the photographs show the whole stride at a glance.

With the trotting horse the motion of each foot can be followed throughout the stride, and accurate measurements taken by the aid of the vertical and horizontal lines. It is curious to notice that the propelling power of the horse seems all in the hind legs, while the front ones seem only used to support the body. Another curious feature noticed was that the sulky was only on the ground about half the time. The ground was perfectly smooth and even, having been carefully rolled, and the powdered lime sifted on gave an excellent surface for observation. The track made by the wheels show they were moving in short bounds, as if the spring of the felloe between the spokes threw the wheel off the ground at the spokes. The wheel would make a mark for about six inches, and then none for about four inches, and so on with considerable regularity.

Gov. Stanford has gone to considerable trouble and expense in having these experiments conducted so thoroughly, and Mr. Muybridge, who is an enthusiast in his art, has carried them out skillfully. The electrical portion of the appliances were made in this city by the San Francisco Telegraph Supply Co. The results are highly satisfactory, and cannot be caviled at. Quite a number of gentlemen witnessed the experiments, among them representatives of the principal daily and weekly papers, and quite a number who make turf matters a specialty. The application of electricity as an adjunct to the camera was perfectly satisfactory in every respect, and the pictures were as accurate as possible. The series of photographs will be of great interest to all having any interest in horses, as they show conclusively how the stride is accomplished at high speed, a subject on which there has been a wide difference of opinion. These pictures, however, settle the matter conclusively, and many will have to give up their ancient prejudices.

We would like, did space permit, to give some description of Gov. Stanford's magnificent place, but it would require several columns to give even an idea of it. The ranch is a short distance from Menlo Park Station, on the S. P. R. R. Around the residence are highly cultivated and ornamental grounds, kept in the neatest order possible, with handsome large stables for the house-horses and carriages, numerous outbuildings, etc. Smooth gravel roads and paths run in all directions and there is a pleasant mile drive up to the large stables where the fancy stock are kept. Here is a very large, handsome stable, where "Occident" and several more valuable animals are kept each in a fine box stall by himself, with all the stable appliances necessary for comfort and health. Extending around this stable on two sides is a long row of low buildings, divided into box-stalls, for other blooded stock. Fields near by are divided up, so as to leave pastures for the yearlings, the mares with and without colts, etc. There are also a group of buildings for the trainers, grooms, hostlers, etc. A bandstand laid-out track passes near by the stables, on which the horses are exercised and trained. The Governor has over 200 head of blooded stock. The horses were all brought out on the occasion of our visit and showed careful grooming and good care. They are all, without exception, thoroughbred, and some of them cost pretty long prices. The Governor's idea is that this climate is the best in the world for breeding thoroughbred horses, and he has procured the best he could find to breed from, being satisfied that the coming trotter will be a native of California. He is using every endeavor to improve the breed of our horses and expresses a very laudable desire to see the turf freed of its obnoxious features, so that its standard will be such that its patrons may once more take a pride in it, which is not at present the case.

THE ENDOWMENT.—In this mine, situate in Columbus district, Esmeralda county, Nevada, there has been struck, says the *Belleville Times*, a splendid and apparently permanent four-foot deposit of ore on the 400 level, 300 feet east of the before uncovered body of sulphuret ore. The ore runs \$155 per ton and has been opened on the 400 and 500 levels.

MORE GRAPHITE.—Major Dreihelbis has discovered an immense deposit of what he believes to be graphite, about 25 miles from Winnemucca. The material is of a black color, very light, soluble in water, has a metallic luster, and marks paper similar to a lead pencil.—*Silver State*.

Smedberg's Improved Pelouze and Audoin Condenser.

The mechanical separation of vapors held in suspension by large volumes of gaseous matter has long been one of the most difficult problems of technology. This difficulty is more particularly felt upon this coast by our gas and quicksilver men, and it is to call to their attention to what we deem to be a very successful move in this direction that this article has been written.

Our attention was lately called to the Pelouze and Audoin condenser, by an article in the *Polytechnic Review*. We had studied the subject up in the journals, when we learned that the well-known gas engineer of San Francisco, Mr. James R. Smedberg, was agent for the machine on the coast, and had added to it several improvements of his own. We take pleasure, therefore, in describing the apparatus as it appears at present with his latest improvements.

Of the original inventors, M. Pelouze is the manager and M. Audoin the chief of the chemical works of the Paris Gas Company. These names are already well known for their contributions to science and technology and by their various researches in laws of combustion and the other phenomena of gas lighting.

The theory which these gentlemen hold in common with Halley, Tyndall, Saussure, Kratzenstein, Bravais and many other physicists is that these molecular aggregations of liquids float in the air for such long periods of time because they are not only very small and therefore expose great surface in proportion to their weight, but also because they are hollow spheres and hence their surface is still more augmented. Others hold that these particles are solid. It is altogether probable that these vesicles are spherical in shape, and assuming this, it follows that if any liquid be broken up into spherical globules, say 1-10,000th of an inch in diameter, that any given weight, say one pound of this liquid, will expose 6,000 times as much surface to the air as the same pound of liquid in spheres one inch in diameter. It seems therefore not to be a matter of vital importance to settle whether these globules be solid or hollow, even if it were possible, as it is not. But all physicists are agreed that between these globules exists a repellent force like that which exists in the gaseous state. This repulsion increases with the temperature and is supposed to cease at 273° below zero C., where all bodies are supposed to be in a liquid state.

The various modes of overcoming these repellent forces and of, therefore, relieving the vapor by an agglomeration of the particles, are chiefly cooling and compression. Either or both of these means are effective in changing a gas into its liquid form, and as has been recently shown, when combined with sudden evaporation, they are capable of reducing even the gases, hydrogen, oxygen, nitrogen and the air we breathe to the liquid and even the solid state.

But in practice it is found that in cooling ordinary crude coal gas down even to 60° Fah., there still remains from 10% to 15% of tarry and aqueous vapors suspended mechanically, although the boiling point of coal tar is about 500° Fah., and that of water 212° Fah.

There are now three ways in which these vesicles may be removed—by chemical affinity, by friction, by impact. In each of the two latter the force acting are adhesion and cohesion also, as will be seen shortly.

Chemical affinity has long been used in the laboratory, but it is difficult of application on the large scale, although we are of the opinion that it might not be valueless in the condensation of quicksilver vapors.

Friction has been successfully used in purifying crude gas in the Eastern States. The escaping vapors were compelled to traverse a hollow corrugated prism, by which means the tar vesicles were retained by the roughened walls, while the gas passed on. But this friction condenser was at best a clumsy and at the same time a costly instrument, as it had to be made of sufficient size to expose each particle in turn to the action of the walls.

There remains one principle which can be brought into operation, the principle of impact. And here the beautiful simplicity of the Pelouze and Audoin condenser must be apparent. It consists of a drum floating in water, as in the accompanying diagram. This drum, in the improved apparatus of Mr. Smedberg, is fed from below with gas. The gas can only escape through the walls of this drum, which are composed of three plates of perforated sheet iron. These walls are spaced about one-eighth of an inch in the clear. The perforations are about 1-16th of an inch in diameter, and are so placed that each perforation is opposite a blank space in the next succeeding plate. The crude gas passing through these plates is thus broken into a multitude of minute jets and projected with an adjustable velocity against the blank spaces of two of the three plates.

As the drum is free to move vertically in its water lute, it is easily adjustable for any given pressure, and it moves then automatically, as the pressure of the inlet gas varies, for the line of flotation of the drum determines the number of side jets at work. This is one of Mr. Smedberg's improvements, as in the original apparatus the gas current came in the other direction, thus losing this automatic effect. The gas, when it has passed through the drum, then follows the direction of the arrow in the figure and passes down the gas channel shown in sec-

tion projecting outwards at the right hand side of the cylinder which encloses the drum in the figure.

The tar, water, etc., which is removed by the walls of the drum, trickles down into the flotation box, then overflows its edges and runs down into the tar overflow.

In the original apparatus there is a costly and complicated system of gas valves, by which means the current of gas is either sent through the apparatus or cut off. Mr. Smedberg accomplishes all this by a very simple arrangement, which is, however, difficult to describe without another figure. The whole of the under part of the apparatus which is in connection with the gas mains is stationary, while the whole of the apparatus above this is capable of being rotated 180° by means of the two handles which project horizontally from the lower part of the casing. From this rotating cylinder and down across the horizontal line of the gas main, hangs the valve arrangement. This consists essentially of a vertical diaphragm whose plane passes through the axis of the cylinder, and of a second which is at right angles to this, but extending only half way across, whose plane also passes through this axis. The lower cylinder is thus cut into three prisms; one has for its base a semicircle, the other two a quadrant. When the handles are turned, so as to bring the semicircular prism in connection with the two mains, the apparatus is "by passed" and the gas does not flow through the machine. When the handles are turned 180°, each of the "quad-

This also reduces the water necessary to remove ammonia and the lime required to arrest carbonic acid and sulphydric acid by about 10%.

3d. That the apparatus is compact, cheap and durable, as well as very easy of management.

4th. But not least, that the gas does not need to be exposed to the action of water, by which great loss of candle power results.

These condensers have been used very successfully in Europe, as appears in the journals, and have been in operation for several years successfully in San Francisco, Sacramento, Oakland, Modesto, Red Bluff, Petaluma, Napa, Inland, Asylum, Reno, Nevada, Boston, Mass., New Orleans, La., etc.

They are made in eight sizes to pass from 50,000 to 3,000,000 cubic feet per day. And we take pleasure in referring for further particulars to Mr. J. R. Smedberg himself, at 129 Beale street, San Francisco.

The New Timber Law.

Annexed is a certified copy of an act for sale of timber land in the States of California, Oregon, Nevada, and in Washington Territory.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That surveyed public lands of the United States within the States of California, Oregon and Nevada and in Washington Territory, not included within military, Indian, or other reservations of the United States, valuable chiefly for timber, but

THE SMEDBERG IMPROVED PELOUZE AND AUDOIN CONDENSER.

rant prisms" is opposite one of the gas mains. The one which receives the incoming gas, conveys it up a vertical pipe, whose upper end is shown in the section to the space beneath the drum, the other "quadrant prism" receives the gas from the "down take" on the side, and conveys the gas into the main. It is evident that when it is necessary to open the apparatus for repairs, etc., which, by the way, is seldom, it is only necessary to revolve the handles 180° and the condenser is by passed. In the larger sizes of apparatus this operation is effected by a tangent screw and ratchet. Another neat and useful addition of Mr. Smedberg's is his "differential gauge." This is shown in the figure at the left, and is so arranged as to give, by proper combination of valves, either the difference between the pressure of inlet and outlet gas, or the difference between either and that of the atmospheric air. It will be seen, therefore, how perfectly the whole apparatus is under the control of the operator. Any stoppage of the holes is at once apparent from the gauge, and the apparatus can be at once by passed. But the singular part of it is that these stoppages are very rare. Abundant certificates from well-known gas engineers proving that the drum kept clean for from six months to one year, and even then the only trouble necessary was a good steaming for three or four hours.

The advantages claimed for this condenser, and we believe fairly its due, are as follows: 1st. Complete separation of the tar. This not only saves the tar for fuel or for sale, but greatly relieves the scrubbers and lime boxes, thus not only saving labor and material, but enabling one to work with less back pressure.

2d. A concentration of the gas liquor, which it separates at the rate of about three gallons to the ton, at 7.9 Baume or specific gravity of 1.055.

unfit for cultivation, and which have not been offered at public sale according to law, may be sold to citizens of the United States, or persons who have declared their intention to become such, in quantities not exceeding 160 acres to any one person or association of persons, at the minimum price of \$2.50 per acre; and lands valuable chiefly for stone may be sold on the same terms as timber lands: *Provided*, That nothing herein contained shall defeat or impair any bona-fide claim under any law of the United States, or authorize the sale of any mining claim, or the improvement of any bona-fide settler, or lands containing gold, silver, cinnabar, copper, or coal, or lands selected by the said States under any law of the United States donating lands for internal improvements, education, or other purposes: *And provided further*, That none of the rights conferred by the act approved July 26th, 1866, entitled "An act granting the right of way to ditch and canal owners over the public lands, and for other purposes," shall be abrogated by this act; and all patents granted shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under and by the provisions of said act; and such rights shall be expressly reserved in any patent issued under this act.

SEC. 2. That any person desiring to avail himself of the provisions of this act shall file with the register of the proper district a written statement in duplicate, one of which is to be transmitted to the General Land Office, designating by legal subdivisions the particular tract of land he desires to purchase, setting forth that the same is unfit for cultivation, and valuable chiefly for its timber or stone; that it is uninhabited; contains no mining or other improvements, except for ditch or canal purposes, where

any such do exist, save such as were made by or belong to the applicant, nor, as deponent verily believes, any valuable deposit of gold, silver, cinnabar, copper or coal; that deponent has made no other application under this act; that he does not apply to purchase the same on speculation, but in good faith to appropriate it to his own exclusive use and benefit; and that he has not, directly or indirectly, made any agreement or contract, in any way or manner, with any person or persons whatsoever, by which the title which he might acquire from the government of the United States should inure, in whole or in part, to the benefit of any person except himself; which statement must be verified by the oath of the applicant before the register or the receiver of the land-office within the district where the land is situated; and if any person taking such oath shall swear falsely in the premises, he shall be subject to all the pains and penalties of perjury, and shall forfeit the money which he may have paid for said lands, and all right and title to the same; and any grant or conveyance which he may have made, except in the hands of bona-fide purchasers, shall be null and void.

SEC. 3. That upon the filing of said statement, as provided in the second section of this act, the register of the land-office, shall post a notice of such application, embracing a description of the land by legal subdivisions, in his office, for a period of 60 days, and shall furnish the applicant a copy of the same for publication, at the expense of such applicant, in a newspaper published nearest the location of the premises, for a like period of time; and after the expiration of said 60 days, if no adverse claim shall have been filed, the person desiring to purchase shall furnish to the register of the land-office satisfactory evidence, first, that said notice of the application prepared by the register as aforesaid was duly published in a newspaper as herein required; secondly, that land is of the character contemplated in this act, unoccupied and without improvements, other than those excepted, either mining or agricultural, and that it apparently contains no valuable deposits of gold, silver, cinnabar, copper, or coal; and upon payment to the proper officer of the purchase money of said land, together with the fees of the register and the receiver, as provided for in case of mining claims in the 12th section of the act approved May 10th, 1872, the applicant may be permitted to enter said tract, and on the transmission to the General Land Office of the papers and testimony in the case, a patent shall issue thereon: *Provided*, That any person having a valid claim to any portion of the land, may object in writing, to the issuance of a patent to lands so held by him, stating the nature of his claim thereto; and evidence shall be taken, and the merits of said objection shall be determined by the officers of the land-office, subject to appeal, as in other land cases. Effect shall be given to the foregoing provisions of this act by regulations to be prescribed by the Commissioner of the General Land Office.

SEC. 4. That after the passage of this act it shall be unlawful to cut, or cause or procure to be cut, or wantonly destroy, any timber growing on any lands of the United States, in said States and Territories, or remove, or cause to be removed, any timber from said public lands, with intent to export or dispose of the same; and no owner, master, or consignee of any vessel, or owner, director, or agent of any railroad, shall knowingly transport the same, or any lumber manufactured therefrom; and any person violating the provisions of this section shall be guilty of a misdemeanor, and, on conviction, shall be fined for every such offense a sum not less than \$100 nor more than \$1,000, *Provided*, That nothing herein contained shall prevent any miner or agriculturist from clearing his land in the ordinary working of his mining claim, or preparing his farm for tillage, or from taking the timber necessary to support his improvements, or the taking of timber for the use of the United States; and the penalties herein provided shall not take effect until 90 days after the passage of this act.

SEC. 5. That any person prosecuted in said States and Territory for violating section two thousand four hundred and sixty-one of the Revised Statutes of the United States, who is not prosecuted for cutting timber for export from the United States, may be relieved from further prosecution and liability therefor upon payment, into the court wherein such action is pending, of the sum of \$2.50 per acre for all lands on which he shall have cut or caused to be cut timber, or removed or caused to be removed the same: *Provided*, That nothing contained in this section shall be construed as granting to the person hereby relieved the title to said lands for said payment; but he shall have the right to purchase the same upon the same terms and conditions as other persons, as provided hereinbefore in this act: *And further provided*, That all moneys collected under this act shall be covered into the Treasury of the United States. And section four thousand seven hundred and fifty-one of the Revised Statutes is hereby repealed, so far as it relates to the States and Territory herein named.

SEC. 6. That all acts and parts of acts inconsistent with the provisions of this act are hereby repealed.

Approved, June 3d, 1878.

Department of State, Washington, June 7th, 1878.—A true copy. SEVELLON A. BROWN.

THE Mechanics' Union at Virginia City, Nevada, are demanding \$5 per day, which it is thought the mining companies will consent to pay them.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly: Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 32 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *Nerve* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News*.

REGISTER YOUR TRADE MARKS.

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

The Large Circulation of the Mining and Scientific Press extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana-British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

HEALD'S BUSINESS COLLEGE,

24 Post Street,
Near Kearny,
San Francisco, Cal.

The largest and best Business College in America. Its teachers are competent and experienced. Its pupils are from the best class of young men in the State. It makes Business Education a specialty; yet its instruction is not confined to Book-keeping and Arithmetic merely, but gives such broad culture as the times demand. Thorough instruction is given in all the branches of an English education, and Modern Languages are practically taught. The discipline is excellent, and its system of Actual Business Practice is unsurpassed.

LADIES' DEPARTMENT.—Ladies will be admitted for instruction in all the Departments of the College.

TELEGRAPHIC DEPARTMENT.—In this Department young men and young ladies are practically and thoroughly fitted for operators, both by sound and paper.

For further particulars call at the College, 24 Post Street, or address for circulars, E. P. HEALD, President Business College, San Francisco, Cal.

BODIE AND ESMERALDA;

—BEING—

An Account of the Past History and Revival of Affairs

In the above-named Mining Districts, with Scientific Reports thereon by PROFS. SILLIMAN and BLAKE, and the late J. ROSS BROWN, with detailed description of leading mines, including Maps and Illustrations, by J. W. WASSON. Single copies, post paid, from this office, \$1.

Opinions of the Press.

"What has long been wanted, not only in this office, but by thousands on the Pacific Coast. * * * It answers authoritatively, in short, a thousand questions asked every day, with the past, present and future of the whole section of country included in Esmeralda and Mono counties."—*Virginia Enterprise*.

"It is a valuable compilation and one which should be in the hands of every man interested in either district."—*Alta California*.

"A vast amount of information. * * * A copy of it should be on the table of every mining operator."—*S. F. Evening Post*.

Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

LAND! BOUNTY!! PENSIONS!!! PATENTS!

Do you want to buy, sell or exchange lands or other property in any part of the U. S. or Canada? Are you a Soldier or Sailor, in want of a Patent? Why not obtain more Bounty or Pension? Do you want to locate Government or State Lands without settlement? Why not? When I have the well-known Approved Soldiers Additional Homesteads, under seal of the General Land Office, and that can be located without settlement, upon any Government \$1.25 or \$2.50 lands, subject to homestead. The Sioux Half-Breed Strip, for location upon unsurveyed lands.

Land Warrants and Scrip of all Kinds

For cash, or part on time. Good title given or no pay. Have you any lands with an imperfect title to sell, or choice vacant lands you know of which could be located to advantage; or claims not lawfully held, which we could contest. Let me hear from you in full, and I will do my best to inform you what is to your advantage.

I will mail you a circular explaining all, and a copy of the new Pension Law. Address, (plainly)

D. H. TALBOT,

General Land, Scrip and Warrant Broker, SIOUX CITY, IA.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens and Perforated Sheet Metals of every description. I would call special attention to my SLOTT CUT and SLOTT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

SWEET JACKSON'S NAVY Chewing Tobacco

Awarded highest prize at Centennial Exposition for fine chewing qualities and excellence and lasting character of sweetening and flavoring. The best tobacco ever made. As our blue strip trademark is closely imitated on inferior goods, see that Jackson's Best is on every plug. Sold by all dealers. Send for sample, free, to C. A. JACKSON & Co., Mrs., Petersburg, Va.

L. & E. WERTHEIMER, Ag'ts, San Francisco

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

THE O'HARRA
CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day..... 3 00
Wood, 14 cords at \$3..... 7 00

Cost of 20 tons.....\$13 50
Cost of one ton..... 67 1/2
From 2 1/2 to 5 per cent. of salt is necessary.
In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

R. HOE & CO.'S
CHISEL TOOTH MILL, SHOP,
And Edger Circular Saws with
Recent Improvements.

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Filers and Files are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

H. L. TATUM & Co., Sole Agents,

No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CUPS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or slop, and at a merely nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAME MAKE.

Certificate of Partnership.

The undersigned having, January 1st, 1878, formed a partnership to carry on the business of general machinists and engineers in constructing and repairing machinery under the firm name and style of Birch, Argall & Co., this certifies that the principal place of business of said partnership is situated at 119 Beale street, in the city of San Francisco, State of California, and that William H. Birch and John Argall, each residing in said city, are all the members of such partnership.

WM. H. BIRCH. [Seal.]
JOHN ARGALL. [Seal.]

STATE OF CALIFORNIA,
CITY AND COUNTY OF SAN FRANCISCO, } ss.
On the twenty-fourth day of May, A. D., one thousand eight hundred and seventy-eight, before me, J. Robert Read, a notary public in and for said city and county, residing therein, duly commissioned and sworn, personally appeared William H. Birch and John Argall, known to me to be the persons described in, whose names are subscribed to, and who executed the annexed instrument, and they acknowledged to me that they executed the same.

In witness whereof I have hereto set my hand and affixed my official seal, at my office, in the city and county of San Francisco, the day and year last above written.

J. ROBERT READ, Notary Public.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, June 11th, \$5,385.71; Modoc, June 10th, \$6,501.22; Alexander, June 10th, \$4,615.68; Gila, June 10th, \$5,289; Modoc, June 12th, \$3,490.10; Northern Belle, June 12th, \$4,446.13; Con. Virginia, June 16th, \$208,600.59; Christy, June 17th, \$5,144; Tybo Con., June 12th, \$4,054.57; California, June 17th, \$188,630.19; Tybo Con., June 14th, \$8,067.67; McCracken Con., June 17th, \$8,990.31; Raymond & Ely, June 14th, \$3,935.20; Star, June 18th, \$5,559; Manhattan, June 18th, \$12,600; Northern Belle, June 17th, \$4,450.48.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

Week Ending June 4th.

CAR COUPLINGS.—Charles H. Wood, Seattle, W. T. TURNING CHISELS.—Homer C. Emery, Union, Ogn. HERRERS.—Joseph Decombe, S. F., Cal. METHODS OF CURING FISH.—Lynnan Woodruff, Ellensburg, Ogn.

TRADEMARKS.

MEDICAL COMPOUND.—Charles Rowell, S. F., Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOR.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at two lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

A Use for Everything.

A more worthless thing than the share certificates of a defunct wild-cat mine, it would be difficult to conceive of. Yet even these have at last been utilized. Many mercantile, and other business failures in the East, have been attributed, during the past four years, to investments in losing speculations, such as mining and railroad stocks, that have declined to merely nominal values, and in some instances there was room to believe that such things were not always the true cause of the failures. The *Engineering and Mining Journal* makes the following statement in regard to the matter:

It has come to our knowledge that there is a constant inquiry and demand from business firms which contemplate "making an assignment" for large quantities of stocks of some mine more or less known. It is not at all essential that the mine be worth anything, but it is essential that a large amount of the stock be obtainable for very little value in the form of hoots and shoes, drygoods, hardware or nicknacks. The stock makes a fine show in the list of assets, and gold and silver mining gets the credit of having caused the failure, and is condemned by each of the bankrupt's numerous creditors as "runious to any one going into it." We commit this point to those whom it may concern.

COST OF TRANSPORTING PETROLEUM.—When Mr. Regan's bill to regulate inter-State transportation by railroad was under discussion in the House, May 9th, Mr. Thompson, of Pennsylvania, said that, last season, 13,000,000 barrels of oil, produced in Pennsylvania, had been shipped to the seaboard. The established rate of transportation was \$1.50 per barrel, which should have given to the railroad companies \$18,500,000. But instead of that the railroad companies had actually received only \$5,000,000, the other \$13,500,000 having been diverted from the stockholders and from the shippers into the pockets of an unscrupulous ring. The bill proposed to abolish that system. In illustration of the magnitude of the oil interest, he said that although 15 years ago it was an article entirely unknown to commerce, now it stood second on the list of exports (cotton being the first), and that it brought back more gold to the country than all the wheat or flour or bacon or beef or lard or lumber or tobacco or any other commodity exported.

THE RIGHT WAY AND THE WRONG.—Mining, like all other business, must be conducted with economy, and wants a practical miner at its head. Nearly all the failures of Eastern investments have been caused by sending out some friend or relative of some of the company to take charge of the mines, who has not the slightest idea of how silver and gold mines are found, let alone how they should be worked. Theory is good and practice is better, but theory and practice are above either, alone. Let your metallurgical students go into the mines and there learn to swing the pick, to drill, to blast, and to distinguish ore from barren rock; let them go into the field and become familiar with the practical part of mining life, and then less money will be thrown away and squandered, and many a valuable property, in place of being condemned, will be made to yield many returns for the money invested.—*Eureka Sentinel.*

SULPHUR-MAKING IN NEVADA.—A. R. Doan, the proprietor and inventor of the steam wagon which has been hauling crude sulphur for the San Francisco sulphur company, has thrown up his contract and will take his wagon to Rye Patch, where he has contracted to haul ore from the mine to the mill. The California & Nevada sulphur company will ship 20 tons of sulphur to-day. This company have been putting in new steam works, and, when completed, expect to run out about 10 tons of refined sulphur a day. Some two weeks ago they met with an accident at the foundry, where their retort was cast, by the explosion of the same when giving it the proper test which the law requires. The company have now received the retort at this station, and it is no light yet either. Its weight is some pounds over four tons and a half.—*Silver State.*

SOLAR STEAM POWER.—We recently mentioned the experiments of W. Adams, of Bombay, India, in boiling water by the heat of the sun; he has lately tried further experiments, as follows: In the presence of several gentlemen of Bombay, nine gallons of water were poured into a small boiler at 9:25 A. M. The rays of the sun were then directed on the boiler, and the water boiled in exactly 30 minutes. After boiling exactly one hour the focus was turned off, when it was found that three and three-quarters gallons had been evaporated. In the experiment described above, he used 198 glass mirrors, each 15 by 94 inches.—*Scientific American.*

STEEL RAILS IN FRANCE.—In 1877, the railway companies of France were purchasers of iron rails to the extent of 48,888 tons, while 136,549 tons of steel rails were required. A comparison with the corresponding figures of 1876 (57,936 tons of iron and 130,681 tons of steel rails), shows a notable decrease in the consumption of iron rails and a corresponding increase in the consumption of steel rails.

Woodward's Gardens were never more attractive than at present. Besides the lions already mentioned, six monster living alligators, several iguanas and a box-constrictor have just been added. New states are constantly engaged for the Pavilion exercises. Rates of admission as usual.

EXAMINE the accelerated endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, \$30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Mansell, Jr., agent of insured, 224 Sansome St., San Francisco.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 614 Commercial St., San Francisco, (fourth floor).

OAKLAND, CAL.

Howell's Improved White Roasting Furnace.

This cut represents the most improved construction of this unrivaled Furnace, the superiority of which over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as none of them combine all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade.

The first cost as well as the cost of operating it is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents, has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice. At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

RANKIN, BRAYTON & CO.,

A WORLD'S TRIUMPH.

The Current of Trade Reversed.

STEINWAY

PIANOS TO EUROPE.

STEINWAY & SONS Orders From Europe

Have increased to an extent, necessitating the establishment of Warerooms in London, England, and connected with it is a Concert Hall, the whole combined making the most elegant Piano Warerooms in Europe, and stands there as a monument of American genius and industry.

It is impossible to mention in the limited space of an advertisement the innumerable triumphs of this energetic firm. They stand foremost as inventors in Piano building in America, and in that respect, no small compliment to their inventions is the undeniable endorsement of all their competitors, as shown in their imitative efforts. Certain principles of the Steinways, are, however, so completely protected, that no imitation or substitute is attempted at all, and the shallow method of crying such inventions down are resorted to and relied upon.

The Steinways designed and perfected the Overstrung and Iron Frame systems. The application of the Agraffe Arrangements to Square and Upright Pianos. The Patent Duplex Scale, creating the most beautiful treble tones, (the Duplex Scale is of recent invention and only to be found in Pianos sold recently). The improved Double Dampers. The later idea extending the Agraffes to every string in the Piano. The highest finish to all parts of the instrument, including first quality of ivory, ebony, felt, cloth, etc. The wood and varnish of such first-class character, that the employment of large capital and experience alone permits.

The name of Steinway has become a "household word" in American homes, and the satisfactory record of 18 years' trial on the Pacific Coast, in itself assures the purchaser that the investment is no speculation, but one of perfect security.

The oft-repeated story of rival makers claiming to have been Steinways' foreman, etc.,

should have no weight with purchasers. An immense manufacturing business like the Steinway' is divided into departments for the various classes of work, and a foreman of one department superintends that alone, and cannot be perfected in other details.

The Steinways (a numerous family) are the inventors and designers of the principles of their pianos, and are alone responsible for the thorough execution of their own ideas.

In the Machinery Department at the late Centennial Exhibition, Steinways were awarded a special medal for an invention for testing their iron frames under a pressure of 5,000 pounds to the square centimeter. (This award was distinct from their medal for the best pianos exhibited.) The iron frames in Steinway pianos are the only ones so tested, and while other makers rely on castings from an ordinary foundry, the Steinways maintain their own foundry, and manufacture a frame of composite metal, which adds greatly to the resonant qualities of the instrument in general.

It often occurs that the attempt is made to raise the character of pianos constructed on less costly principles to the rank that the Steinway maintains, by naming a price, the same, or nearly so. This method is frequently exposed by the perfect willingness of the dealer to make astonishing discounts for cash, or extremely long credits; systems not entertained in any first-class business. In selling a Steinway piano, a guarantee of worth is given protecting the purchaser for five years, and catalogues issued by the Pacific Coast Agencies have a uniform rate of prices in gold, and where desired a liberal installment plan is offered to responsible buyers, with an additional charge of simple interest on deferred payments. Catalogue mailed on application to

THE CLIMATE OF CALIFORNIA.

A thoroughly studied and ably written treatise on this subject by Hon. B. B. Redding, appears complete in the PACIFIC RURAL PRESS for January 26th, and also the MINING AND SCIENTIFIC PRESS. Based upon facts, figures and careful and extensive observations made in various parts of the State on this important subject, it is a volume of reliable information, interesting to every resident of the State. The information is condensed in a paper read before the California Academy of Sciences, and is published in the PRESS as read before that Society without any alterations or omissions. Extra copies, post-paid, 10 cents. Address DEWEY & CO., Publishers, 202 Sansome Street, San Francisco.

The Stiles Rotary Engine.

We illustrate herewith a new form of rotary engine recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by W. C. Stiles, of this city. The arrangement is such that both the force and expansive power of the steam can be exerted to drive an endless chain or belt, provided with suitable pistons which pass through the cylinders, and thus produce a rotary motion of the pulleys over which the belt passes, and from which the power may be taken.

As shown by the engraving, the engine consists of two horizontal cylinders mounted upon a suitable frame. At each end of the cylinders is a peculiarly-constructed pulley, or wheel, around which travels an endless steel belt or chain, which passes through the cylinders, and which is provided with pistons. These wheels are provided with recesses in their rims, which serve the double purpose of providing a seat for the pistons on the endless belt while they are passing around the pulleys, and also for preventing the belt from slipping on the wheels. The endless belt passing around these wheels has pistons attached to it at regular intervals so constructed and packed that they will fit snugly in the cylinders. One cylinder being placed above the other, the action of the steam on one cylinder is in the reverse direction to its action in the other. The cylinders consist of simple tubes, inside of which the pistons fit closely, being provided with proper packing to make them steam tight while passing through. At one end of each cylinder is a steam chest provided with a cut-off valve and gates. These gates are operated by an automatic sliding bar, a cam motion being given to a lever from the wheel upon which the belt travels, to open the gates of the cylinder at the proper instant to allow the pistons to enter. Just as they enter, the gates close behind them, making a steam-tight compartment, and the steam being admitted by the same action, the piston is forced through the cylinder, the other end of which is open, a continuous rotary motion of the pulleys thus being maintained. One piston is going through one cylinder as the other is going through the other in an opposite direction. The pistons are so arranged that one is taking a full head of steam, while the other is running on expansive steam. The exit of each piston allows the steam to escape freely, leaving no back action whatever. As the endless belt expands when heated, the slack is taken up automatically by having one of the pulleys set on a sliding carriage.

Mr. Stiles has one of these engines, an experimental one, now at work in the basement of the Cosmopolitan hotel, corner of Bush and Sansome streets, in this city. This has two brass cylinders five feet long by three and one-fourth inches bore, the pulleys being three feet three inches in diameter. Mr. Stiles states that this indicates 15 horse-power, running 300 feet per minute under 100 pounds of steam. The endless chain is 25 feet long, and is really a linked piston rod, passing through suitable stuffing boxes in the gates.

An engine of this class can be moved at any time, there being no heavy bed frame, but simply good strong framework. The inventor proposes to build one with two cylinders 20 feet long, 10-inch bore, to run 400 feet per minute, the whole engine to weigh about four tons. Steam may be cut off at any desired point and

allowed to work expansively the rest of the way. By this means the full force of the steam can be utilized, there being no opportunity for any back pressure whatever. By the peculiar construction described, a rotary steam engine is provided in which the full expansive force of the steam can be utilized, and the difficulties heretofore encountered in the practical working of rotary engines are avoided.

As to the advantages claimed by this style of engines over the reciprocating engines the inventor makes the following points: "That for instance in a small reciprocating engine of three to six inches bore of cylinder the length is five, six or eight inches, and there is a certain amount of back action every time the pistons go from one end of the cylinder to the other; hence in running the distance of 10 feet there would be 20 back actions. Now by taking the lowest back action laid down by the ablest writers, 3% has been lost every six inches run, which in 10 feet run would amount to just 3% of the whole power. Every time the piston moves from one end of the cylinder to the other the valve is opened to let the steam in and then closed; the valve to let the steam out is also opened and closed. This requires the moving of these valves twice each time the piston moves six inches, making or taking power 40 times in 10 feet. There is also loss when cutting off

Notices of Recent Patents.

Among the Patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

SPARK EXTINGUISHER.—John Johnson, Bloomfield, Sonoma county. The invention is an improvement in that class of extinguishers used in the smoke-stacks of engine furnaces, and in which water is employed in various forms to kill or quench the sparks. It consists in the employment of a rose-sprinkler, having minute perforations, through which water is forced upward in the same direction as that which the sparks move. It also consists in a novel arrangement of the perforations and the top of the sprinkler, in order to prevent the minute jets from being reunited by the exhaust, so as to form large drops or streams of water, as this will reduce the efficiency of the extinguisher, besides throwing the water and soot over all the machinery near. In the dry harvest fields, where there is a rainless climate as in this State, if an engine is used it is extremely dangerous to the surrounding combustible material and water is almost always scarce, so that the amount used for an extinguisher of

in strengthening the pocket opening and the angles of the pockets by the employment of peculiar strengthening bands which are stitched one along the lower and one along the upper edge of the pocket opening, each extending past the other and at the same time past the corner of the pocket opening so as to form a double supporting stay or re-enforce. The method of strengthening the pockets is simple and practical, and makes no material addition to cost of manufacture. The corners of the pockets are then supplemented with a number of thicknesses of cloth and diagonal stitching in addition to the cloth of the garment itself. This makes a strong, firm re-enforce or strengthening device which may be applied to any pocket in the classes of garments for which it is specially intended, and which is neat in appearance and simple of manufacture.

Close of the Volume.

With this number we close Volume XXXVI of the MINING AND SCIENTIFIC PRESS. A glance at the index on the last page will show of what a varied character the information given in these columns has been. Although mainly devoted to mining matters, we have by no means confined ourselves to this branch, but have gathered

from all sources facts and information of interest and value to the industrial classes. The work we have done speaks for itself, and we believe no constant reader can say he has not had value received. The firm foundation which our journal has secured in the public favor leads us to regard it more and more with pride, and to work the harder that its reputation for value and usefulness may be zealously maintained. We think that the closing volume may be considered in some respects better than those which preceded it, and we shall spare no effort to make this progressive improvement characteristic of the coming volume. As a new volume commences with the next issue, we take occasion to suggest that it is a good time for new subscribers to send in their names. While there is every reason for gratification at the circulation that this journal has reached, we are yet well aware that there are numbers of miners, mechanics and lovers of science to whom it might be a source of usefulness and profit. We feel no hesitation in urging the claims of the paper upon the notice of those for whose special benefit it is published. No one should be without a home paper devoted to their interests. It is the duty and pleasure of the editors to make the Press a welcome weekly visitor, and the more visits it pays the more welcome we can make it. The MINING AND SCIENTIFIC PRESS has now been published so many years by the same proprietors that experience has shown them exactly what is needed by the readers, and they intend endeavoring to improve the paper from year to year in the future as in the past.

FOR THE YOSEMITE.—Our devoted publishers, Messrs. Dewey and Ewer, have left their cares behind and chartering an express wagon and team have taken the overland route for the Yosemite, on a camping expedition of three weeks' duration. We bespeak them a kind greeting and a warm spot on the grounds of our readers to whose ranches they may come. They need the rest, and they have earned it, for their labors have not been light. May they return refreshed and invigorated.

THE EMPRESS OF GERMANY is reported as likely to visit Paris shortly in strict incognito.

THE STILES HERCULES ROTARY STEAM ENGINE.

steam in this class of engines, and in the crank motion and power required to run a large fly-wheel."

In this new rotary engine there is no back action of steam. The cylinders may be made of any desired length to 40 feet and upwards. The power is always given off at full leverage and pound for pound secured, less the friction. The steam ports and gates are moved but four times in going the length of a ten foot cylinder, or any length of cylinder, while they are moved 40 times in going that far in a small reciprocating engine, as above referred to. If there are any leaks they may be remedied at once. The steam may be cut off at any point and works expansively to the end of the cylinder. The exhaust may pass off up the pipe, shown in the engraving, on top of one end of cylinder, or may exhaust into a case containing the pulley.

In marine engines, for which the inventor considers this one specially adapted, heavy bed plates and working beams are done away with, and there is no extra iron and bracing required to strengthen the vessel. The first cost alone would be a great saving, to say nothing of the economy of working. The engine is well adapted to any kind of work. A company, called the "Stiles Hercules Engine Co.," has been formed to manufacture these engines, and further information may be had from the inventor at the Cosmopolitan hotel.

On the 22d inst. cloud hursts occurred in the mountains northeast of San Buenaventura, causing the Ventura river to pour down such a volume of muddy water that the ocean was discolored for a distance of six miles.

this class in addition to that required for an engine is an important feature. By the use of this device it is possible to perfectly quench the sparks with a small quantity of water. Various attempts have previously been made to use water to quench sparks and cinders before they leave the stack, either by throwing a thin sheet of water across the stack or by discharging the water into the exhaust pipe, or by some form of jet not specially intended for the purpose. These have failed, because of the tendency of the water to concentrate in larger streams or drops instead of being formed into a mist. Mr. Johnson's experience has proven that the water must be reduced to a most minute form before being discharged into the stack and then prevented from reuniting, and this apparatus effects it so thoroughly that no appreciable moisture is thrown out, but a dry mass of straw may be laid on top of the stack and it will not be ignited. It is a well-known fact that wet steam will quench the sparks better than a sheet or streams of water, and experience also shows that water in the form of sheets or streams will also impede the draft, so as to prevent keeping up steam with the damp fuel it is often necessary to use. With this device the water is practically so thoroughly united with the steam, which is often highly superheated, that it becomes practically a part of it and acts as wet steam. This effectually quenches the sparks and no bonnet is needed.

POCKET FASTENING FOR GARMENTS.—Berthold Greenebaum, S. F. This invention relates to an improvement in that class of garments known as overalls, jumpers, etc., and consists mainly

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Reducing Miners' Wages.

[Written for the Press by H. D.]

In responding to the demand for greater economy in the business of mining, some of the companies operating on this coast have sought to compass this end through a reduction of the wages paid their workmen. It is not in this item of expenditure that reform is called for. The men who delve in our mines are not as a general thing over-paid. It is true, their wages in the interior districts seem high. But, everything considered, they are not excessive. Traveling to and from these remote localities is costly. Living there is expensive, and very rarely does the miner get steady employment. He usually works by the day and may at any moment be discharged, and once out of a place it may be a long time before he gets another.

Again, this vocation besides being uncertain and laborious is a dangerous one, and it is only just that they who follow it should be paid for this extra peril. In the course of time a large proportion of all underground miners lose their lives or get so crippled and maimed that they can no longer follow their calling or even earn a livelihood at anything else. The loss of eyesight or of an arm or a leg is a thing of frequent occurrence with those who survive the terrible accidents of the mine. Only a few days since nearly 200 workmen were instantly killed by an explosion in an English colliery, and scarcely a day passes but some of these hardy men are killed or fearfully mangled in the mines on this coast, these accidents sometimes being the result of the criminal carelessness or the sordid parsimony of Superintendents or other agents of their employers. Surely something should be allowed these men for this increased percentage of danger so incident to this business.

It is thought by persons unacquainted with the requirements of the occupation that almost any strong, able-bodied man is capable of making a good subterranean miner. This is a mistake. A man may possess the necessary strength and other corporeal qualifications, and yet lack the mental powers and aptitudes, without which he is unfit for the business. To go down and toil in the deep, dark chambers of the mine requires nerve, courage and a capacity for endurance that few men possess. There are thousands who above ground could face any amount of danger undaunted that in the heated and suffocating atmosphere of the mining pit would faint and give up or perhaps fall a victim to their fears on the slightest mishap. There are men who could creditably head a forlorn hope or desperately charge in battle, who could not climb the tall ladders nor descend the deep shafts of a mine without quailing. For engaging in a pursuit so injurious to health and so perilous to life the miner's remuneration is little enough. How poorly would the most of us feel compensated with his pay for going down into the gloomy and appalling abyss, and there inhaling the deadly gases, exposed to destructive explosives, toiling daily and nightly as he is forced to do. To work under such hard conditions, with death impending on every hand, should certainly entitle the laborer to an additional dollar or two per day.

And worse still than this cutting down of the miners' wages to starvation prices is the practice to which some companies have had recourse of substituting Mongolians for white laborers where the latter have declined to accept the reduced wages proffered them. This is a matter of general concernment. It reaches beyond its bearing on the pecuniary interests of a mining company. Our miners as a class are noted for many fine moral qualities as well as great bodily perfection. They are the best developed portion of our population. Many of them would serve well as models for the sculptor. This is something in an age distinguished for its physical degeneracy. Then, too, familiarity with danger has, as usually happens, tended to make them brave, generous and self-sacrificing. No class of the community give more freely for the relief of the destitute and suffering, nor do any more readily imperil their lives in the cause of humanity than they. No one can read of the magnanimity and bravery displayed by these miners on the occasion of the late calamity in the Gould & Curry without being deeply impressed with their intrepidity and genuine nobleness of character. Nor is this an isolated case. On all similar occurrences they have shown a like self-abnegation and disregard of danger in their almost reckless efforts to rescue their companions from the jaws of death. This is a heroism in the best sense of the term. This is courage of the loftiest kind, and we cannot afford to have men like these supplanted. As a people we cannot consent to the destruction of a school that nurtures these noble qualities and trains up men to the practice of the more exalted virtues, even though it slightly diminish the cost of hillion production and add to the net earnings of mining incorporations. Lessened expenditure and increased dividends are altogether desirable, but they must not be reached through the sacrifice of the public good and the extinction of the most manly and most needed element of modern society. Retrenchment in mining must be effected through some other method than the curtailment of wages or the substitution of Chinese for Caucasian labor.

Notes on Amador County.—No. 3.

[From our Traveling Correspondent.]

Fiddletown and Vicinity.

The mining interest in and about this place has been neglected, or rather prospecting has not been prosecuted with that energy which has characterized other portions of the county. In fact, but little prospecting has been done since placer mining ceased to be profitable, the old miners, many of whom remain here still, preferring to turn their attention to other pursuits, or to hunt for quartz, deep gravel deposits, etc. The creeks and gulches hereabouts were exceedingly rich, and wherever quartz has been found and prospected, it has shown well in gold, but explorations here have not exceeded 100 feet in depth, although quartz indications and croppings are easily traced for long distances on the surface.

This town is located on the eastern mineral belt that runs through the county parallel with the great mother lode, and about seven miles distant from it. This belt is not so wide or well defined as the mother lode, but where it has been explored, as at Volcano, it has been found to carry small, rich veins and pockets, but nowhere has it been sufficiently prospected to determine its extent or value.

A Sulphuret Mine.

At a point eight miles northeast of Fiddletown, has been found and partially opened a very extraordinary mineral deposit. It consists of a fissure in the solid granite eight feet wide, with smooth walls and a slightly easterly inclination. This crevice is filled with a soft bluish mud that can be shoveled out with but little picking. This mud contains gold sufficient to pay for washing; also a very large percentage of sulphurets and float quartz. Some of these sulphurets are crystallized in octagons as large as a hen's egg, with sides and angles perfectly true, and occasionally one bespangled with small specks of gold. These sulphurets yield, by chlorination, \$25 to \$35 per ton. This mine has been opened to a depth of 100 feet. It is called Hite's sulphuret mine, and is owned by J. H. Young; Judge Purrington, of Fiddletown, has the extension and proposes to put up working machinery.

American Flat Mine and Ditch Company. This company has just put in 3,480 feet of tail flume, two and a half feet in the clear, through which they are hydraulicing the tailings from American Flat that were run in from Slate creek. This body of tailings is about 20 feet deep, and it will require at least two years to wash up. They use here 800 inches of water under 250 feet pressure. A partial clean-up of 20 boxes yielded \$1,300, a result satisfactory to the owners. The gold is of a good quality, assaying at the mint \$55 fine. Water for washing is supplied by the Parrington ditch, one of the best water rights in the county, its source being the Middle Fork of the Cosumnes river. This property, managed by Mr. A. H. Harris, is situated one and a half miles south of Fiddletown.

Volcano.

This town was well named, being situated in a deep basin washed out by Sutter creek, though having the appearance of an old crater or bed of a lake. Powerful dynamic forces have evidently been at work here, the vicinage presenting an interesting field for the study of geology. Volcanic, diluvial, glacial and earthquake agencies have all left traces of their action in the tall hills, deep ravines and lava flows of this neighborhood. The rich alluvial soil, resulting from the attrition of these warring forces and the more genial influences of the atmosphere and sun, holds the gold that at first so richly rewarded the labors of the miner and produces the abundant crops of grain and the luscious fruits that bless the farmer and the orchardist. The placer mines here have been fabulously rich, it being estimated that \$25,000,000 have been taken from this small basin. Mining and prospecting has been much neglected since the surface placers were exhausted, until the last year, when a little life was infused into this lethargic population by a few enterprising men, who have undertaken to develop some of the untouched mineral resources of this extraordinary locality. First in order is

The Consolidated Amador Hydraulic Gold Mining and Land Company,

Superintended by L. McLaine, and owned principally by Charles McLaughlin, of San Francisco. This property is situated one and a half miles south of Volcano, on the road to Jackson, at a place called Grass Valley creek, or Pleasant valley, and contains 540 acres, all, or nearly all, a gold-carrying gravel bed, varying in thickness from four to 40 feet. They are now putting in a flume, 7,165 feet in length and three feet square, to run the gravel through. This is a work of no small cost, as a cut through the rim-rock had to be blasted to a great depth to get sufficient fall. The grade of flume will be three inches to a box of 14 feet, which is thought sufficient, as there are no heavy boulders to be run off. Six hundred inches of water, under a pressure of 250 feet, and one giant will be used. The ground has been thoroughly prospected by shafts at different places and found to be uniformly rich in coarse gold on the bedrock. The land cost \$32,000, which, with the cost of improvements,

Government patent, etc., will bring the whole up to a round sum. The company is incorporated in San Francisco. Adjoining this property is the claim of

Louis Loudekens,

On the same creek, containing eight acres, also patented, which has been prospected by shafts and yields largely. Mr. Loudekens has been staying by this little nest egg for years and is now about to be rewarded for his patience. He will work his mine through the outlet of the Amador company.

The Volcano Gold Gravel Mining Company, Superintended by George Muck, and owned mostly in Santa Cruz, are running a tunnel into the Volcano Basin, to tap the gravel bed on which the town stands, 42 feet deeper than it has been heretofore worked. This basin could not heretofore be bottomed, owing to the great amount of water met with. This tunnel, which will drain it, will be 2,000 feet long and cost \$65,000. One thousand feet has been run and the remaining 1,000 feet will be finished in about 10 months. It will drain several hundred acres of mining land and undoubtedly make available a large amount of hidden treasure.

Many Mines.

From Mr. Robt. Stewart, who has been an assayer here for many years, I glean the following facts with regard to many mines just being opened in this vicinity. Mr. Stewart is repairing the old 10-stamp Fogus mill, which has lain idle for many years. It is driven by water power and will be in running order in a few days. He will commence milling the ore from the Robinson mine, in which there has just been opened a three-foot ledge, yielding ore that will mill \$50 per ton. He will also work ore from the Downs mine, situated one and a half miles from Volcano. This is an old mine, long since abandoned but recently reopened by Mr. Downs. The ledge is from two to three feet wide and the ore will mill from \$50 to \$100 per ton, much of it assaying still higher. They have some 200 tons on the dump, ready for the mill when completed.

Other Mines.

In the same neighborhood is the Golden Gate, the Confidence, David Robinson, the Rogers & Epling, with 10-stamp mill, and the old Markley mine, all showing good pay ore, with veins averaging from two to four feet in width. On Pioneer creek, about five miles from Volcano, is the Griesbach mine, which has been worked about two years and yielding handsomely. Adjoining this is the old Pioneer mine, the Belding, the McCreevey and several others, all of which enjoy a good local reputation.

Pine Grove.

Near Volcano, is a pleasant little mining camp, with some good hydraulic mines near by, that are yielding very well. Judging from some prospects recently obtained by Mr. J. T. Wheeler, merchant of that place, the placer deposits about Pine Grove are far from being exhausted, if indeed they have all yet been found.

W. G. A.

Jackson, June 19th, 1878.

Mining in El Dorado County.

[From our Traveling Correspondent.]

The Old Pacific,

Now known as the Placerville gold quartz mine, is just now the center of most interest about Placerville. It is located within the limits of the town, on the serpentine belt, or what is usually denominated the "mother lode." Discovered in 1853, it was worked continually until 1862, during which time it is represented to have yielded not less than \$400,000. From that date to this but little work has been done upon it with the exception of sinking a vertical shaft, east of the vein to the depth of about 300 feet. It has recently passed into the hands of English capitalists, who propose to thoroughly test its merits. Mr. J. B. Thomas, the present Superintendent, took charge about a month ago, since which the water has been pumped out, the obstructions cleared away, the mine wholly or partially retimbered, and connection made from shaft above referred to with the old works. The result of the late explorations are more than satisfactory. The ledge is said to be fully four feet in width, and the assays from the quartz, taken in connection with the many fine gold specimens in sight, would indicate that the mine under the new dispensation is not likely to lose much of its old reputation for richness.

Immediately west of the Pacific and the serpentine belt is a slate formation varying in width from 250 to 400 feet, and extending north and south from the Cosumnes river to the middle fork of the American. Along the line of this slate belt a large number of promising mines are located, among them the Oregon, Epley, Church Union, Gross and

The Rose,

Which last is understood to be owned and managed by Mr. C. W. Brewster (an intelligent business man of Placerville), and as far as developed gives promise of a bright future. The hoisting works, situated about 500 feet from the Pacific shaft, were completed in April last, at which time also the work of further sinking was resumed on a shaft commenced in 1874. The motive power is water, conducted in iron pipes 3,200 feet in length from the canal of the El Dorado W. D. G. M. Co., at an elevation of

280 feet, eight inches, supplying ample power for hoisting both water and rock from a depth of 150 feet. The ore is a *fac simile* of that extracted from the Amador county mines. As far as tested it has given excellent results, 300 tons taken out soon after the commencement of operations averaging \$46 per ton.

The Gross Mine,

The property of Messrs. Gross & Moen, two miles north of Placerville, has been opened to the depth of 130 feet. The new tunnel, soon to tap the ledge, will strike it 250 feet deeper. In width it varies from 18 inches to eight feet, and in the widest parts averages \$8 per ton, the quartz from a pay chute going upwards of \$100. The mine besides furnishing a livelihood for its owners, has paid for developments and improvements, all of which may be attributed to good judgment and prudent management.

The Keegau mine, bonded to J. Blair & Co., has been opened by two tunnels, respectively 110 and 115 feet along the ledge, the greatest depth reached being about 75 feet, and width of lode at bottom of the connecting shaft, three feet. A test of 90 tons as it came from the mine gave a gross yield of \$23.50. Having secured an extension of the bond, the above parties are about to proceed vigorously with the work. The same gentlemen own the old American, a north extension, from which about \$40,000 is represented to have been taken out within the past few years.

The Sandstone Lode,

Lying east of the serpentine belt, owned and worked by Messrs. Pearce & Kennedy, seems to be a *lusus nature* in quartz formation. In many thousands of miles of travel through the mineral regions of the coast, I have met with nothing of the kind before. The fissure is about four feet wide and can be traced a long distance, walled on each side by the tilted slate. Small quartz seams from two to four inches wide and from two to four feet apart, cross the fissure at nearly right angles, pitching north and west at an angle of about 45°—the fissure running north and sides nearly perpendicular—while smaller seams, forming a kind of joint, pitch south, cutting the former at right angles. The gold is found in pockets and generally where the seams come in contact with one of the walls, or at the conjunction of crossing seams of quartz. The mine has thus far paid fair wages.

Other Mines.

The New York, in the same vicinity, is about 10 feet in width, the gangue consisting of talcose slate and quartz. Seventy tons recently worked yielded at the rate of \$15 per ton. The Griffith Consolidated, at Diamond Springs, situated on or near the serpentine, is said to be from four to six feet in width. Some of the rock taken from the depth of 75 feet, the past winter, milled from \$20 to \$30 per ton. It contains from 3% to 4% of sulphurets, estimated at from \$100 to \$150 per ton. It is expected that operations will soon be resumed here.

The Springfield Mining Company

Are working what was formerly known as the Church Union mine, situated a few miles southeast of El Dorado. It is under the superintendence of Mr. S. R. Poundstone, and it has reached a depth of 550 feet, at which point it shows a ledge of undoubted merit. The 10-stamp mill of the company has been running steadily since last April, the rock averaging about \$20 per ton, while the prospects of the mine for the future are represented as particularly encouraging.

The Davidson quartz mill and mine have been leased to Mr. H. H. McClellen, of San Francisco, for one year, with privilege of purchasing. The work of hauling out the water has commenced. The formation and character of the rock speak favorably for it as a mine.

Messrs. Stackslager & Plumtree, at Uniontown, have a small quartz vein from six inches to two feet between the granite and slate that has recently paid remarkably well, panning out upwards of \$15,000 with a couple of months. The gangue, carrying the most gold, possesses peculiarities worthy the attention of the mineralist. A specimen for examination will be forwarded by first opportunity.

The drift and hydraulic mines of the county are paying about as usual, but little change having taken place within the past two years. Some new ground has been broken at Badger hill that prospects to the full satisfaction of miners best posted. Hoisting works have been put up and a mill will soon be erected.

The Cedarville water and gravel mine, at Indian Diggings, the property of Messrs. Chas. E. McLane & W. T. Henson, after a heavy outlay, is now beginning to pay expenses. They hope to take out \$1,000 per day as soon as the main bed of gravel is reached. The face is 130 feet in height, and the gravel prospects 75 cents to the cubic yard.

A. C. K.

Placerville, June 23d, 1878.

INVESTMENTS IN MINES.—The shrewdest and most sagacious business men in this country, to-day recognize the fact that mining investments, prudently entered into, are the safest and most profitable that capitalists can make, and they admit that "mining" will be the next "sensation" in financial matters. The very facility which mining investments is giving for floating unsound or dishonest schemes, makes it all the more necessary that prudent men should carefully investigate the claims and merits of any enterprises offered them before parting with their money.—*Engineering and Mining Journal.*

MECHANICAL PROGRESS.

An Imperial Street Car.

Dom Pedro, Emperor of Brazil, is having a street car built for his own use, in New York city. The *American Manufacturer* says it is somewhat larger than the ordinary car in use here, and is finished in ash, basswood, plain and curled cherry, and plain and bird's-eye maple. The roof is of the perforated wood now in common use, allowing impure air to escape when the ventilators are closed. The exterior is painted in the national Brazilian colors—green and gold—the upright pillars of lake, with gold line ornamentation, and the lower woodwork a delicate cream green.

The word "special" in large letters is upon the outside. The Brazilian arms occupy the middle panels on either side, and sketches of Brazilian and North American scenery fill the remaining panels. In each side are five plate glass windows, the center one four feet six inches wide by two feet eight inches high, the others 11 inches in width by the same height. All the metal work is nickel plated. A large central lamp lights the car at night. A sofa, two chairs and a center table in the Eastlake style comprise the furniture. The interior panels are also decorated with landscapes. Lambrequins of dark blue stamped leather, with black velvet borders, studded with brass nails and with a fringe of woolen tassels, are over the windows.

In the doors are set large mirrors, and small ones fill the space between the windows. The floor will be carpeted with Axminster. The platforms are protected by wire grates, and a life-guard prevents persons from getting under the wheels. The car will be used to convey the Emperor from his country house to his executive palace in Rio de Janeiro. It will occupy the court of his palace when not in use, and when required will be switched upon the track of the Botanical Garden railroad company.

AUTOMATIC CYCLOMETER.—Contrivances for registering the revolutions of machinery are numberless, and new modifications are continually being devised. The principle of nearly all is the very simple one upon which the record of a gas meter depends, and this is, perhaps, the best, being the least intricate. *Iron* describes a cyclometer, and especially adapted for bicycles and carriages, a larger form of it being made for machinery. The peculiar feature of this is, that the case revolves, leaving the inner mechanism and face to remain in one position, where it is retained by a weight in its lower part. The revolution of the case drives, by means of a center pinion, the toothed wheels which move the indexes, and thus a register is secured. For carriages, cabs, and omnibuses the case forms a cap at the end of the axle, every revolution of which is recorded, and the dial indicates either the number of revolutions, or, by a different graduation, the actual distance traversed in miles and yards. For bicycles, the cyclometer is clamped on the axle inside the spokes of the driving wheel, and it is marked to register revolutions only, a table being furnished to convert these into distances, according to the diameter of the wheel driven. The same instrument is thus applicable to various-sized bicycles. An advantage of this form of indicator is that its hermetic sealing is perfectly easy, and in fact almost necessary, so that the chance of introduction of dust and wet is reduced to a minimum. In the case of machinery—say a printing machine—the cyclometer is screwed on the end of one of the impression cylinder, and there does its work as satisfactorily as in the other capacities we have mentioned.

THE CARE OF BRIDGES.—The following statements and suggestions are contained in the report of Mr. C. E. Williams, C. E., State Inspector of Bridges, to the Ohio Railroad Commissioner, and taken from advance sheets of the Commissioner's report for 1877: As a rule, the bridge men look after their structures closely, but in some cases have been negligent—bridges were found out of adjustment, and in some wooden bridges the main braces were almost off from the chords. In other cases there was too much adjusting; the structures were in danger of being pulled to pieces and the life of the bridge shortened. When a nut is rusted so that it is fixed and will not turn, it does not follow that this member is in proper tension, nor, if the nut turns easily, that it must be turned so long as it can be moved. It requires constant care, judgment and a knowledge of strains upon the structure, to adjust and keep a bridge in proper condition, and there is no certainty of it so remaining for six consecutive weeks after a careful inspection. Iron bridges should be so constructed that every part can be reached and covered with a heavy coat of paint suitable for the purpose. There are portions of a bridge where one-sixteenth of an inch taken off from each side of the web each year, by rust, will very soon render the parts worthless. On new wooden bridges, with heavy timbers not well seasoned, paint should be used with caution, applying at first but a light coat, merely sufficient to prevent the absorption of moisture, not so heavy as to hermetically seal the timber and cause it to take the dry rot from the inclosed sap.

Machine for Cleaning Ships' Bottoms.

We read that a firm of shippers in Glasgow have patented a hydraulic cleaner for ships' bottoms, which is well spoken of. The apparatus consists of a small portable hydraulic machine and keel-catcher. On the machine is placed a rotating brush, which is put in motion by a turbine. A canvas hose connects the turbine with a hand or donkey pump. The keel-catcher will travel and retain its hold on any curved stem or straight keel by means of conically-shaped india-rubber rollers, which are moved either forward or aft by means of an endless rope from the deck. In commencing the operation, the keel-catcher is adjusted to the stem of the vessel, above the water-line, and lowered by the pulling of the endless rope. The machine, moved toward the keel by the rope passing through the keel-catcher, will, owing to the updrift buoyancy, press the revolving brush against the ship's side, whatever its shape, and clean it effectually. When the machine is felt to have reached the keel, the rope attached to its tail pulls it upward. After it has reached the water-line the operation is repeated, the keel-catcher and pulling ropes being shifted the length of the brush nearer the stern, so that a fresh strip of the hull is cleaned. The machine works up and down in this way, until it reaches the stern, and when one side of the vessel is cleaned the machine is attached to the other side and worked as before. The bottom of the Allan steamer *Corinthian* was cleaned in this way as she was coming up the river, and an inspection after she had reached the gearing dock showed that it had accomplished the object perfectly.

PNEUMATIC GRAIN ELEVATOR.—The *Revue Industrielle* gives a description of a new pneumatic grain elevator, constructed by Renhay. It consists of a centrifugal ventilator, the suction pipe of which is carried to a receiver placed upon the level to which the grain is to be carried. From the same receiver the supply pipe runs to the place from where the grain is to be lifted. Between the openings of the suction and the supply pipe of the receiver is an inclined plane, which throws the grain downward. A screen prevents the grain from entering the suction pipe, through which only the dust is carried off. A piston regulator at the lower end of the supply pipe acts in such a manner upon an adjustable nozzle that the proper proportion between the amount of air and grain admitted is automatically maintained. The principle upon which this pneumatic elevator acts is that when solid particles in movement in a pipe are mixed with air, a semi-fluid is formed in which the pressures vary in accordance to the laws governing ordinary fluids.

SPECIFIC GRAVITY OF BESSEMER STEEL.—In the *Chemical News*, Sergius Kern, the author, describes some experiments made with the Bessemer metal, samples of which were obtained from the retort just before the addition of the spiegelisen. As it was of some interest to know the specific gravity of such a metal in the forged state, a specimen was hammered under a steam-hammer, and from the bar four pieces were cut and polished in order to examine the specific gravity, which was found to be at 16°C.:

Samples.	Specific Gravity.
Outside part: I.....	7.4821
II.....	7.4902
Inside part: III.....	7.5009
IV.....	7.4938

The fact that such a specimen of Bessemer steel has such a low specific gravity, even in a hammered state, may be explained by the porosity and great difficulty in forging such a metal, which, in the melted state, was not freed from the oxides of iron by the addition of a convenient quantity of spiegelisen.

GERMAN WORKSHOPS.—A few years ago Germany bought a great proportion of her naval materials and stores in England. But of late she has been able to draw on home sources of supply. The heaviest iron plates are now manufactured at the Dillingen works; engines of all sizes are turned out by the Egell Company at Berlin, the Vulcan Company at Stettin, and the Weser Company at Bremen; anchors are made by Hensell & Lueg and the Gute Hoffnung Company; anchor cables by Vinske & Blatt and the Duisburg company; wrought iron blocks and articles by Messrs. Borsig at Berlin, and Krupp at Essen. Government dockyards and private establishments are building men-of-war of all sizes, including the largest, with all the latest improvements demanded by modern science. Westphalian coal is, it appears, exclusively employed on board their men-of-war.

STEAM ROAD WAGONS.—In 1877 the Wisconsin Legislature passed a bill offering a bounty of \$10,000, for the best practical steam road wagon, and lately a commission of two farmers and one engineer was appointed by the Governor to pass upon the inventions submitted. The day fixed upon for that purpose was June 10th, and some half-a-dozen machines were entered for competition. As a test, each wagon was required to carry a heavy load over an ordinary country road for 200 miles, at the rate of five miles per hour. The result is not yet announced.

SCIENTIFIC PROGRESS.

What is the Function of Chlorophyll?

This and other questions are discussed by Sydney H. Vines, in a recent address on "The Chemical Aspects of Vegetable Physiology," before the English Chemical Society. As regards the composition of chlorophyll, we have but little information. There are at present several distinct views as to its proximate composition: one that it is a definite and distinct chemical entity; the second, that it is a mere mixture of coloring matters, or rather of two groups of coloring matters, one group being blue, and to which the name cyanophyll is applied; the other yellow, and termed xanthophyll. Another view, supported by Pringsheim, Karl Kraus, etc., holds that chlorophyll is nothing less than the cyanophyll of other observers, while the xanthophyll is a distinct substance, which is a product of the degradation or formation of chlorophyll, but forms no integral part of it. The same diversity of evidence prevails with the ultimate constitution of chlorophyll. According to Pfander, it contains 0.37% N; other results give 7%; whilst a Russian observer, Timiriazoff, believes it to be an ammoniacal compound, and has called it chlorophyllin. One point seems to be agreed upon by all observers, viz., that it contains iron in its molecule. The opinions which prevail as to the action are various. Wiesner thinks that the growing cells absorb CO₂ from the air, that the chlorophyll combines with the O, while CO unites with the elements of water to form carbohydrates. The chlorophyll in its turn is deoxidized, and the oxygen thus set free is evolved by the plant. So that, according to this view, chlorophyll acts as a carrier. Karl Kraus suggests that the process is one of reduction, and that chlorophyll is formed by the combination of a substance, leucophyll (for whose existence there is no experimental evidence), with the products formed by the reduction of the carbonic acid absorbed from the air. The chlorophyll is then split up by the action of light into leucophyll and other bodies, the latter forming starch. The leucophyll recombines, and so the process goes on continuously. According to Sachs, chlorophyll is a product of assimilation and by the further action of light is converted into starch. By the action of purpurin or resorcin, coloring matters, more or less remotely resembling chlorophyll, have been formed. It is known, moreover, that carbohydrates can be oxidized into aldehydes and aromatic substances. From some experiments of Karl Kraus, it is probable that some substance resembling an aldehyde exists in seedlings, while Gurup Besanetz has detected pyrocatechin in plants. Some results of Karl Kraus seem to show that in seedlings an aldehyde and an aromatic substance unite in the dark to form aetioline, but in the light to form chlorophyll. So that, on the whole, there is some foundation for the theory of Sachs, which may be summed up thus: that seedlings have the power of decomposing their stored up carbohydrates, forming acids and aromatic substances. The former are reduced to aldehydes, uniting with the latter to form chlorophyll (or, in the dark, aetioline), the ultimate product being again starch. If we trace out the probable destiny of the carbohydrates, we find that one portion is used to build up the vegetable cell-wall and is there deposited as lignin, etc.; a second part combines with nitrogen to form protein—but of the seat of formation of this protein we have no idea—whilst a third portion is decomposed into chlorophyll for the newly-formed parts of the plant. If any excess remains, it seems to be stored up for another year.

Farther Liquefaction of the Gases.

Since the liquefaction of oxygen, the chemists have pushed the process farther and have drawn down other aeriform substances. According to a review in the *American Journal of Science*, it appears that Cailletet, studying the compressibility of acetylene, observed a marked departure from the law of Mariotte in its behavior, and, pushing the condensation still further, succeeded in liquefying it. The apparatus consisted of a hollow steel cylinder, thick enough to resist a pressure of several hundred atmospheres, having screwed into it at the top a bronze collar carrying a thick glass reservoir closed above, and continued downward by a larger tube, open at the bottom. This glass tube contains the gas to be liquefied, its lower end dipping below the surface of mercury up into the tube, compressing the gas and finally liquefying it in the narrow portion at the top. In compressing acetylene, the temperature being +18°, numerous droplets are seen to form and run down the walls of the tube, under a pressure of 83 atmospheres. Reducing the pressure gradually, the liquid returns suddenly to gas, filling the tube for an instant with a thick fog. Liquid acetylene is colorless and extremely mobile; it appears to be highly refractive, and is lighter than water in which it is soluble in all proportions. It dissolves paraffine and fats. Cooled to zero in presence of water and linseed oil, it forms a white compound like snow, which decomposes on heating or lowering the pressure. The tension of the acetylene vapor is as follows: at +1°, 48 atmospheres; at 2.5°, 50; at 10°, 63; at 18°, 83; at 25°, 94; at 31°, 103. Comparing the tensions of acetylene, ethylene,

and ethylene hydride (C₂H₆) which contain in equal volumes, equal weights of carbon united to increasing quantities of hydrogen in the ratio 1, 2, 3, the author finds the tension of acetylene at 1°, as above, to be 44 atmospheres; that of ethylene at 0°, according to Faraday, being 46 atmospheres, and that of ethylene hydride—now liquefied for the first time by Cailletet—at 4°, being 46 atmospheres, its liquefaction taking place at a pressure a little less than that of acetylene. In a subsequent paper, Cailletet announces the liquefaction of nitrogen dioxide, by a pressure of 104 atmospheres at -11°. At 8°, the dioxide is still gaseous under a pressure of 270 atmospheres. Marsh gas, compressed by 180 atmospheres at 7°, shows, when the pressure is suddenly diminished, a thick fog like that given by carbon dioxide under similar circumstances; whence the author hopes to effect its liquefaction.

THE INTERNATIONAL GEOLOGICAL CONGRESS. Prof. T. Sterry Hunt announces that the time for the opening of this congress in Paris is now finally fixed, by the local committee, for the 29th of August, and the congress will remain in session about a fortnight. Further details as to organization and place of meeting will soon be made public. Meanwhile, it is announced that from the 20th of August to the 15th of September, the library and reading rooms of the Geological Society of France, No. 7 rue des Grands-Augustins, Paris, will be at the service of members of the congress. As before, it is requested that all those who desire to take part therein will make it known to the General Secretary, Dr. Ed. Jannetaz, at the above address, where, also, the subscription of 12 francs, required for each member, may be sent to Dr. Bioche, Treasurer. Ladies are admitted to the congress. The local committee add to the above announcement as follows: There is reason to believe that the numerous collections of geology and paleontology (minerals, rocks, fossils, maps, plans, sections, models in relief, etc.) to be found in the Universal exposition, will realize the expectations, expressed in the circular of the International committee, of an International Geological exhibition. All exhibitors of such collections are requested to send, as above, such lists as will enable the General Secretary, Dr. Jannetaz, to prepare a special catalogue of them for the use of the congress.

TEST OF WOODY FIBER.—According to the *Journal of the Franklin Institute*, Dr. Wiesner recommends phloroglucin as an extraordinarily delicate reagent for woody fiber. Place a drop of a half per cent solution of phloroglucin upon a bit of pine, and moisten the spot with a drop of hydrochloric acid, and there immediately appears a beautiful lively red stain, verging upon violet. On drying, the violet tinge becomes still more marked. Even if the solution contains only one-hundredth of 1% of phloroglucin the red color is very decided; and if there is not more than one-thousandth of 1% the reaction can be recognized under proper precautions. If a strip of pine is allowed to remain in such a solution for 24 hours, hydrochloric acid gradually draws out a perceptibly reddish stain. The slightest traces of woody substance in vegetable tissues can be readily detected in this manner. The tenderest germs, by means of this reaction, show a woodiness in the cells. Every trace of woody substance in hemp and flax can be detected by the phloroglucin. Dr. Wiesner suggests that it may be used to distinguish hemp from flax, and also as a means of dyeing fabrics woven from vegetable fibers.

SPOTTED FRUIT.—*La Science pour Tous* says that M. Duchartre presented recently to the Academy of Sciences at Paris a paper by M. Prillieux on the dark spots which appear on the skin of apples and other fruits, giving the results of observations as to whether or not these and the cracking of fruits were due or not to parasitic fungi. He finds that there is "unique" proof that disease is due to the presence of a fungus, which not only penetrates the epidermis, but also the solid tissue of the fruit. The fungus attacks the leaves and branches, as well as the fruit, and thus travels by means of propagation hy drafts. And this is the chief reason why it often seems to be confined to one variety of fruit. The name of the same fungus is *Cladosporium dendriticum* of Walther. M. Duchartre pays a compliment to the address to the Pomological Association at Chicago, in 1875, by Mr. Thos. Meehan, of Philadelphia, and contends that the observations there noted correspond with the recent researches of M. Prillieux, and which prove, he says, that on both sides of the Atlantic "microscopic fungi clearly explain these morbid appearances."

A CURIOSITY.—A Tuolumne county paper says: Mr. Patrick McClosky, who is mining out his lot on Jackson street, Columbia, upon which he has resided over 25 years, a few days ago found a cast-iron ball four inches in diameter, three feet below the surface, in a natural deposit of gravel. It is much corroded, a scale one-eighth of an inch thick being formed over the entire surface, as though it had been exposed to sufficient heat to cause oxidation. No plausible theory has yet been advanced as to where it could probably have come from, and by what means it was placed in the gravel where found. In an adjoining claim, there has been found many Indian relics, such as flint arrow-heads, stone mortars, pestles, etc., in a strata of gravel underlying what is commonly termed surface gravel.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

ADVANCE.—*Chronicle*, June 22: Ore continues to be taken from this mine, and the quality is improving, and the mine generally is looking better. On Thursday, last week, fires were lighted in the furnace. Crushing continues, and leaching tubs are in preparation. One ton of ore from Mexico has been received from San Francisco at the Advance mill for treatment.

AMADOR.

PLYMOUTH.—*Ledger*, June 22: The California Boy quartz mine, owned by Evans, Briggs & Co., is looking well. A quantity of rock taken out this week was exceedingly rich, a few specimens pounded in a mortar yielded at the rate of \$100 per ton. The highest kind of a prospect is obtained by scraping the footwall after the ledge is removed. The shaft is only 20 feet deep, with a well-defined ledge and two inches of gouge. The footwall is as smooth as a billiard table. Free gold is frequently seen in the ore, which also contains considerable sulphurets and iron. It is the intention of the owners to get out sufficient rock for a crushing between this and the Fourth of July. The Chicago mine is also opening up favorably. It is down to the depth of 65 feet. Some of the rock has been crushed at the Drytown mill, but I have heard nothing reliable as to the yield.

GRAVEL MINE.—Mr. Monterichard, the discoverer of the Monterichard mine, has recently had the good fortune of finding a large and very rich gold-bearing gravel deposit, on Jackson creek, about three miles below town. He is now constructing a ditch from near the Monterichard to the claim, preparatory to working the same by hydraulic process.

THE PHENIX is paying splendidly. It is rumored that a new opening will be made upon the lode south of the present works in view of putting up 40 additional stamps.

AT SUTTER CREEK Mr. N. L. Gage is having very satisfactory results from his new chlorination works.

BUTTE.

FROM HELLTOWN.—*Record*, June 22: The Hupp claim, on Butte creek, has been cleaned up, and after 90 days work, six men per day, \$10,000 has been taken out. Quite a number of claims here have recently changed hands, and at good figures. The majority are held by companies that refuse to sell them at any price. Knowing the value of their claims they prefer to hold them. The Stryker & Maurice claim is doing well. They are taking out a good amount of gold, and are at present cleaning up. Though expenses have been heavy, it is a success. Maulhry & Co. have cleaned up, and were satisfied with the past and looked to the future for a large amount of the yellow "root of all evil." The Shephard & Co. ditch is progressing as rapidly as circumstances will permit. It is an expensive and hard job, but when completed it will place Helltown "way up." It is rich in mineral, but without water the country cannot be developed. Adams & Co. cleaned up three weeks' arrasting dirt. Three men were employed, and the amount washed out was \$2,400. Mr. Ford is getting his river claim in working shape. Last year it paid well, and no doubt this year it will be equally as good.

NEVADA.

ORIENTAL.—*Transcript*, June 24: Since June 1st have hoisted from this mine 100 tons of ore, and might have doubled the amount had they a place to put it. Work on the 350 level is being continued; both drifts are looking well. The winze on the 300 level is down 15 feet and looking well. There is no change in the character of the rock in the raise of the main tunnel.

CENTENNIAL.—Another engine has been put up on the Centennial mine, on Osborn hill, which gives sufficient power to work deeper than heretofore. Sinking the incline for another level has been in progress for some days. Another crushing of rock, amounting to 60 loads, is being hauled to the Orleans mill. It promises to yield as well as previous crushings.

WATT BLUE GRAVEL.—The drift is in 330 feet from the shaft, with no change in the gravel. Will continue drifting until they get a favorable place to sink a winze. The machinery is working smoothly.

A NEW VENTURE.—Mr. Thos. L. Hughes, who lives on the Rough and Ready road, about two miles southwest of town, is prospecting in the ridge near his dwelling house, for gravel. He has put up hoisting works, and is sinking a perpendicular shaft. The shaft is down 150 feet, and the appearances indicate that there is a true channel there, and that it will soon be reached.

PLACER.

HUNT'S HILL.—*Forum*, June 19: The McAllis company are driving a bedrock tunnel, 800 feet in length, of which 560 are completed. This tunnel, when finished, will bring them about 25 feet lower at the head. The ground is known to be immensely rich and will reward them handsomely for the outlay, while other improvements included amounts to a good many thousand dollars. The Turner claim has been shut down after a successful season. The McCleod claim, recently sold to a San Francisco

company, for \$35,000, is well situated, having the natural outlet for the whole hill. They have put a very expensive rig on the claim—1,500 feet of pipe, furnished by Mr. Hoskin, of Dutch Flat, made and laid under the supervision of Mr. Boeck, which cannot be surpassed in workmanship and skill in this State. The flumes and undercurrents, under the management of Mr. King, are fine, substantial pieces of work and are a credit to that gentleman. The reservoir, under the charge of E. Boho, of Nevada City, is as fine a piece of work of the kind as there is in the county.

THE DIVIDE.—A note from Michigan Bluff informs us that business on the Forest Hill Divide is good and getting better. That part of the county is coming up. The mining season has been more than usually encouraging. Some new developments have been made and others are promised. The towns are all lively and the people generally happy.

PLUMAS.

JACKASS QUARTZ MINE.—*National*, June 22: The shaft here is down 40 feet, at which depth the ledge shows well, about five feet of clear quartz with good walls and has every appearance of a true vein. Many pieces of the rock show fine gold and the hand-mortal and horn bring out surprising prospects. The quartz has a healthy appearance and shows better by far than anything in that line we have seen on this side of the Indian valley ridge. They are taking out 100 tons of rock to be crushed in the Bell mill, and if it does not show a clean-up worth telling about, we shall miss our guess. The ledge can be easily traced for hundreds of feet, and a look over the ground will convince any quartz miner that the property is a valuable one, and that a permanent and, what is better, a paying mine is sure to be opened.

RICH GULCH.—Captain Corser says things are flourishing on the river. His late clean-up shows that he has made an ounce per day during the water season, besides prospecting a body of gravel which is sure to give him rich returns in the future. The Rush Creek Flat boys are again on the lead and taking out big pay. Hyde is doing well and the Hallsted claims paying as usual. The water has commenced to "let up," but the season will show good average results.

HEAD OF NELSON.—We learn from Senor M. Nunes that the prospects for the miners on Nelson and Hopkins creeks were never better. There are more men at work in that locality than at any time before for years, and most of them are doing well. There is lots of snow in that country yet and there will be an abundance of water till late in the fall.

THE CASCADE gravel company, on Grizzly mountain, have opened a splendid bank of gravel, having a face of 100 feet now, with the bedrock pitching into the hill. The company have an abundance of water and are using about 400 inches. The water will last until late in August, if not longer.

STRUCK GRAVEL.—The Bell Bar blue gravel company have struck a good lead of paying gravel in their claims in the middle fork. They have been prospecting for a long time at considerable expense and have recently put new machinery on the ground and prepared for extensive operations. Their success will encourage others and before long there will be a number of good claims developed on the Blue lead in Plumas county.

MORE QUARTZ.—H. Smith and R. Bell are sinking an incline on a ledge a short distance above Bushman's Black Hawk claims. They are getting some fine prospects and think they have got a permanent good thing. There is evidently a fine showing of good quartz in that locality.

SISKIYOU.

THE LUCKY BALDWIN.—*Yreka Union*, June 22: On Saturday last the water increased so in this mine that the one 10-inch pump at work could no more than keep it even, so the work of sinking the shaft was stopped and preparations made to put in another pump at once. The carpenters have built the frames and beams necessary and the pump was put into position on Wednesday. The additional pump is also a 10-inch and it is expected that the two will have no trouble in keeping down the water. If, however, they should fail to keep out the water, the company have two other large pumps, one of 10-inch and one of six-inch capacity, ready to be put in. The pumps were started up yesterday morning and the work of sinking the shaft resumed.

THE MINES.—the numerous placer and quartz mining enterprises commenced in this county this spring, has greatly improved our business interests, and if they only turn out successfully, there will be no place on the coast more prosperous than Siskiyou county.

SIERRA.

MINING ITEMS.—*Mountain Messenger*, June 22: The Highland Mary mining company, whose works are situated at Wahoo, near Port Wiue, is about ready to raise up to tap the gravel channel, under which they are supposed to be. A contract will soon be let for a short piece of tunnel, and when that is completed, a shaft will be raised. It is the universal belief that a fine channel will be tapped. The Pioche mine is again having trouble with water. The large pump will soon be in place, when it is to be hoped no further trouble will be experienced. The Brush Creek mine still holds its own, the ledge being 12 feet wide. The mill is now running on good rock.

TUOLUMNE.

THE SOULSEY Co.—*Independent*, June 22:

This company, under the management of Mr. John Lecchman, are substituting water for steam power. Five hurdy-gurdy wheels are being placed in position, and will no doubt materially lessen the cost of running. Seventy-five men have been employed in and about the mine, but 15 of this number have recently been discharged for want of work to keep them employed.

WORKING AGAIN.—The Milton mine, near Tuttletown, owned by a San Francisco company, began working again yesterday week. Mr. Selleck, Superintendent, informs us that he intends sinking at least 400 feet, gold or no gold, to test the claim. The shaft is down 17 feet, with a two-foot vein. This is the mine worked before on the strength of a divining rod or gold indicator.

THE GOLDEN GATE.—The hoisting works at this mine are being erected, and ditches are being cut to convey water to the mine, which is now furnished by the Tuolumne Water Co. through the new pipe at the southeast end of town. The works will be erected in the tunnel, and the water to run them will be conveyed in a pipe down the shaft.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—*Gold Hill News*, June 26: There is no change in any of the ore-producing sections of the mine. Sinking the C. & C. shaft is making fair progress, the bottom still in hard blasting rock and the flow of water strong. It is now down 44 feet below the 1950 station. There is no change of value to report of the work on either the 1500 or 1600 levels. Retimbering the Consolidated shaft is being pushed ahead with all the speed possible, the heat being so intense it being almost impossible for the workmen to endure it for even a few minutes at a time. Double shifts of men are employed and every effort used to give the men all the air possible, and still the heat is so great that they cannot endure it for more than a few minutes at a time. This necessarily makes this portion of the work very slow and greatly impedes the extraction of ore and the advance of the prospecting works on the lower levels.

CON. VIRGINIA.—There is no change in any of the ore stopes on the 1200, 1650 or 1750 levels, although much difficulty has been experienced in prosecuting the work on all the lower levels of the mine during the week on account of the great heat. The winze in the ore body on the 1650 level has completed a connection with the west crosscut from winze No. 1, the entire depth continuing in ore of a good quality. Another winze in the ore body below this level has been started 70 feet further to the southward, the bottom of which, at a depth of 17 feet, still continues in splendid ore. The north drift from No. 2 winze on the 1750 level still continues in good ore. The north drift from No. 3 winze on this level is steadily advancing, the face in low-grade ore.

CON. IMPERIAL.—West crosscut No. 1 from the main north and south lateral drift on the 2400 level is still advancing in a fine character of vein material, the face showing more quartz than at any time since the drift was started. The face of west crosscut No. 2 on the same level is in ground of much the same description.

SAVAGE.—The water in the main incline is down to a point 58 feet below the 2100 station. The east drift and the Suto tunnel on the 1640 level are so close together that the loading and running away of the cars from the face of the header in the tunnel can be distinctly heard. There is not much doubt now that this important connection will be completed by or before the 4th of July next. On account of an insufficiency of air to drive the north lateral drift on the 2000 and the west drift on the 2100 levels, it was necessary during the first part of the week to suspend work in the 2000 level drift and concentrate the entire volume of air in the west crosscut on the 2100 level.

SILVER HILL.—The north drift on the 800 level is steadily advancing, the face still in favorable vein material. The south drift on the same level is also making good progress. The east crosscut, No. 3, recently started from the north drift is steadily advancing, the face in vein matter mixed with quartz.

OPHIR.—The south drift from the 2000 station of the winze sunk on the ore vein, running to connect with the bottom of the joint winze is steadily advancing in vein porphyry on the east side of the ore vein. The northeast drift on the west side of the ore vein on the 2000 level, is in a distance of 43 feet, the face in hard blasting porphyry.

YELLOW JACKET.—The north winze below the 2200 level having reached the 2400 level, a station is being cut out for a drift east at that point, and the sump is nearly completed. This new level of the Yellow Jacket is the deepest, below any initial surface line, yet attained in any mine on the Comstock. Water does not interfere, although some may be expected before the drift reaches the new shaft.

SUTO TUNNEL.—Total length of tunnel last evening 19,918 feet. The face of the header is in a good quality of Comstock vein matter—ledge porphyry and quartz with clay seams. It is now so near the heading of the Savage drift, 1640 level, that the peculiar vibrations and other noises connected with the Burleigh drilling operations in the face of the tunnel are plainly distinguishable by the Savage miners. The connection when completed will be a few feet below and a few feet north of the Savage 1640 drift.

JUSTICE.—A small amount of good ore is

being extracted, which is being shipped to the Santiago mill for reduction. The ore stopes on the 1150 level afford no change of value to report.

GOULD & CURRY.—The main incline has reached the 1900 level, at which point a station is being opened and preparations made to lower the main lift pump, so as to stop the use of the several small donkey pumps now being run with compressed air. A large blower is being erected on the 1500 level, which, when completed, will greatly assist in cooling the drifts on the 1900 level.

BELCHER.—The main east drift on the 2360 level is in 102 feet, the face in vein porphyry. The north drift on the same level, running to connect with the south drift from the Crown Point, is making steady headway, and will complete the connection in three or four days more.

BELLION.—The north drift on the 2000 level is being pushed vigorously forward, the face still in a very encouraging character of vein matter mixed with frequent stringers of healthy looking quartz. The face of the east crosscut on the 1840 level is in much softer and more favorable ground, carrying a much larger percentage of quartz than for some time past.

JULIA CON.—The main south drift on the 2000 level is being pushed steadily forward, the face in a mixture of quartz, porphyry and clay of the most favorable description. The character of the ground going south shows a steady improvement.

OVERMAN.—The east drift from the main shaft on the 1600 level is steadily advancing, the face in hard blasting porphyry. Cutting out for the 1600 station in the winze preparatory to drifting westward to connect with the east drift from the main shaft, is making good progress.

CALEDONIA.—The north drift on the 1600 level is steadily advancing, the face still in quartz mixed with clay, the flow of water being steadily increasing. The face of the main east drift on this level is still in vein porphyry.

CROWN POINT.—The main south drift from the bottom of the winze on 2300 level is being pushed ahead at the rate of eight feet per day, the face still in favorable blasting ground, and will probably complete a connection with the north drift from the Belcher some time during the coming week.

LADY WASHINGTON.—The north drift on the 1150 level is steadily advancing, the face in quartz and ore of a very encouraging look.

CHOLLAR-COMBINATION SHAFT.—It is now down 2,262 feet perpendicular. The flow of water has shown a steady increase, amounting to 53,500 gallons per day.

ALTA.—The east drift recently started on the 1450 level is now in 23 feet, the face in west country rock. The north drift on the 1350 level is in a distance of 153 feet, the face in quartz. The north drift on the 1250 level is also making good progress, following the west wall of the ore vein. It is now in 388 feet.

ALPHA.—The north drift from the 2400 station of the joint winze on the Imperial north line is steadily advancing, the face in vein porphyry mixed with quartz and clay. These streaks of quartz afford very encouraging assays. It is the intention to soon start crosscuts both east and west to determine the value of the ore vein on that level.

BEST & BELCHER.—A joint crosscut east has been started directly from the 1900 station of the winze, which is steadily advancing, the face showing some very fine quartz and streaks of low grade ore mixed with quartz and porphyry.

SIERRA NEVADA.—Sinking the main incline below the 2000 level is making steady progress, the vein matter in the bottom showing a steady and favorable improvement.

MEXICAN.—The joint east drift on the line of the Union Con., on the 1600 level, is steadily advancing, the face still in blasting porphyry. It is now in a distance of 420 feet. The main north drift will complete a connection with the old drift to-day or to-morrow.

ELY DISTRICT.

THE MINES.—*Pioche Record*, June 22: The Meadow Valley mill is now turning out so much bullion per month that it is commencing to excite considerable interest both here and below. Work on the Raymond & Ely continues as usual; very little change to note since last report. Have a good body of ore on the third level, and one between the ninth and tenth levels, which latter is not of a very high grade, but pays well. Continue to extract about 15 tons daily of fair ore. Work on portions of the compressor machinery is progressing satisfactorily. The Hillside have now 250 tons of ore on the furnace dump, and are hauling down as fast as possible. Coal is also coming in rapidly. Think the furnace will start up Tuesday.

EUREKA DISTRICT.

THE MINES.—*Sentinel*, June 23: The K K furnace is working smoothly on Phenix ore. Two train loads, about 120 tons, were sent down from the mine yesterday. Work has been commenced on the Atchinson Union. A shaft will be sunk a sufficient depth to demonstrate the value of the discovery. The machinery at the Alhion is working very smoothly without hitch or delay. The boys are unanimous in the opinion that steam is far ahead of hand power in working mines. The new hoisting machinery for the Kit Carson mine has been purchased and will arrive in about 10 days. A force of men are at work getting the mine in shape for active operations. Salt Lake buyers are about closing a contract with an Adams hill mine owner for 1,000 tons of ore. The Jackson company are actively at work prospect-

ing their mine. There has been no new developments.

RICHMOND CON.—Says the Superintendent's report: Week's run, \$75,000, from 1,060 tons of ore. Week's product of refinery, \$56,000. Since my last, operations have been carried on in the mine and at the furnaces with usual regularity, and the developments in the mine have been equal to the extraction.

THE GEDDES & BERTRAND mine is coming to the front with a magnificent ore body that promises to rival, if not exceed, any deposit ever found in the property. We mentioned some two weeks since the fact of a bonanza having been found just below the 150 level. The vein was followed down to a point 40 feet from the 300 level, where it has opened out to a width of 14 feet. Assays taken from the face, at random, averaged from \$500 to \$800 per ton. From 15 to 18 carloads of crude bullion, valued at from \$20,000 to \$35,000, are shipped daily from Eureka.

REVELLE DISTRICT.

THE GILA.—Eureka *Sentinel*, June 23: Late reports from this mine are very encouraging. It is now believed that the original bonanza has been rediscovered. There was a displacement in the ledge, but after much prospecting its true course and situation has again been ascertained. The company has a splendid body of extremely high grade ore, and there can scarcely be a doubt that the Gila will again in the near future take rank as one of the dividend-paying properties of eastern Nevada. Bullion shipments are already on the increase, and the management is firm in the conviction that they now have a mine that will do to stand by, and that the confidence generally reposed in this property a few years ago was not misplaced.

TYBO DISTRICT.

THE MINES.—A correspondant of the Eureka *Sentinel* speaks of this district as follows: The mines of the Tybo Con. mining company still continue to furnish an abundance of ore for the steady running of the furnaces. A fine quality is being extracted from reserves on the fourth and fifth levels of the 2 G. mine. The new Casket shaft yields a good quantity of ore. The process of partially refining the bullion is carried on quite successfully, three shipments being concentrated into one. This constitutes quite an item, considering high freights and the present low price of lead. The mines in the surrounding country are attracting the attention of Eastern capitalists just at present. Morey, Hot creek and Rattlesnake district bid fair to become active camps during the summer.

WHITE PINE DISTRICT.

EBERHARDT & AURORA.—*News*, June 22: A change for the better has taken place in the formation of the ground here within the past two weeks. The hard spar has given out, and the ground is now a soft lime shale, which is quite loose, and at intervals small caves are encountered, which experts look upon as favorable indications of near approach to mineral deposits. The softening of the ground greatly facilitates the work of the contractors, last week 80 feet being driven, the best run, we believe, that has been done since the commencement of the work.

THE JENNIE A.—This company, which has for the past two years done constant and vigorous prospecting on their mine, are now rewarded by a good development of ore. They have 1,000 tons on the dumps, and 6,000 more exposed in the mine, ready for extraction. They are now making the necessary preparations for the erection of a 40-ton stone furnace, which they expect to have running by the first of August.

STARTED UP.—The King company's furnace at the Three-mile house, was fired up last Monday morning, and up to this time, has been running and turning out bullion very nicely. Six tons of bullion were shipped Thursday, and hereafter regular shipments will be made. We did not learn how high the bullion graded. It is the intention to make a 40 days' run, if sufficient ore can be had for that purpose.

Arizona.

MINES AND MINING.—*Enterprise*, June 19: Good mining and promising prospects all along the line just now. Commencing at the tail end of Bradshaw mountains, the Tiptop company's fine 10-stamp mill is crushing away, enriching its owners and the "chloriders" of Humboldt district, who get their crushing done at this mill, and who feel that under the present mill regime, they have rights which Superintendents are bound to respect. The district is fairly alive with industrious miners and prospectors. The same is true of Tiger, Pine Grove, Peck, Turkey Creek, Hassayampa and Big Bug districts. The Peck company's 10-stamp mill is doing excellent work. Mine looking real well. Tiger mine gradually growing better. Thorough mining being done on it. Azlan mill running first-rate. Plenty of water in the mountains, all of which augurs favorably for a flourishing and eminently satisfactory mining business.

PECK BULLION.—Boetcher's buckboard, with four bars of fine silver bullion, arrived here at 1 P. M. to-day; value of bullion, \$5,713. Mill running. Everything satisfactory. The road through the timber, from Precott to the mill, is about finished.

Colorado.

GEOLOGICAL PUZZLE.—*Sunshine Courier*, June 22: E. B. Dorsey, the California mining expert, who has been in Colorado for some weeks past, returned Monday from a trip to Rosita. While there he was shown several specimens of

ore from the Maine mine, owned and operated by E. C. Bassick. The specimens are boulders, from the size of a walnut to a ton's weight, and are covered with a coating of sulphurets of iron, copper, zinc, lead, gold and silver. The gold value of the ore is about 60%. The boulders themselves are porphyry, and some are quite soft and crumbling while others are solid. At the depth of 200 feet carbonate was reached, some of it imbedded in the porphyry. The formations above mentioned are a complete puzzle to all who have seen them. Their appearance upsets all geological and mineralogical theories now extant, and will doubtless prove a hard nut for the scientists.

GROWING TOWN AND A GRAND PROSPECT.—The little town which has sprung up at the Golden Age mine wears quite a thrifty appearance, and promises to become a permanent fixture. It is located at the head of a grassy gulch, near the summit of the divide, between the waters of St. Vrain and James creeks. A few steps takes one up to a sheer precipice where a magnificent view of the valley, from the divide south of Denver to the State line on the north, can be taken in at one sweep. And by simply turning in your tracks, the snowy range in its towering majesty—with Long's Peak visible almost to its base as a center piece—lies at your feet.

Montana.

ONE SHIPMENTS.—*Miner*, June 18: Every day during the last week long lines of wagons could be seen pulling out from the Original lode claims, heavily loaded with ore for the terminus of the Utah Northern. Upon inquiry, we learn from Mr. Jos. Rosenthal, the Superintendent, that the week's shipments from the Gouvon aggregate 80 tons, while something over 40 tons was the amount shipped from W. A. Clark's Discovery claim. Newark, N. J., is the destination of the greater part of this ore, but some of it goes much further—to Freiberg or Swansea—we are informed.

MACHINERY AND SUPPLIES FOR THE ALICE MINE.—Some idea of the capital required for the systematic working of a silver mine may be gathered from an inspection of the machinery and supplies for the Walker Bros.' mine and mill, received during the past week, and an enumeration of articles now on the road. First may be mentioned 60 tons of salt and 19 tons of quicksilver, now at the mill or on the road. But these two items are of trifling cost when compared with the 20 wagon loads of machinery and supplies received last Tuesday. In this lot were included two of Griffith & Wedge's double-cylinder hoisting engines, each of 80-horse power. Accompanying the engines are two 16-foot tubular boilers, each 54 inches in diameter, and a smoke-stack that will be 45 feet high and 46 inches in diameter when set up. Among the other articles received were 2,100 feet of one-inch cast-steel wire hoisting cable, 300 feet of three-quarter steel wire rope for guys, four cast-iron sheave wheels, each five feet in diameter, two iron reels, each four feet in diameter, one improved cage, one five-stamp mortar with stamps and everything complete for an additional five-stamp battery, new mullers for all the pans in the mill, a year's supply of new muller shoes, cast-steel dies and shoes for the entire batteries, dry-kiln plates, etc. In addition to this lot already received, 30 tons of freight, in which are included two Howell roasting furnaces, are now on the road and are expected to arrive within three or four weeks. Upon the first of July, still another train will leave Corinne, with 70 tons freight, consisting of dry kiln plates, steel shoes and dies, salt and supplies in general.

THE SILVER BOW AND BLACK TAIL FLUMES.—Work upon those flumes has been prosecuted with unremitting energy since the beginning of the hydraulic season, and there is now a fair prospect of a golden harvest to repay the labor expended upon them. In the main creek, Silver Bow, about 1,000 feet of flume is now in, a depth of about nine feet below the original surface having been reached. At this depth, with no sign as yet of bedrock, the gravel prospects from one-fourth to three-fourths of a cent, in shot gold, to the pan, the prospects continuing to improve steadily as the work advances.

Utah.

PARK CITY.—Salt Lake *Tribune*, June 23: The latest discovery here is the Mountaineer, located northwest of the Ontario mine. Five feet from the surface a 14-inch vein, assaying from \$40 to \$200 per ton, silver, has been struck. The Portland, located near the McHenry mine, has a four to ten-inch vein, with assays varying from \$30 up into the hundreds. The Tip has a fine eight-inch vein, assaying from \$10 to \$30. The prospect is located in Ontario gulch, half a mile north of the Ontario mine. In the Porcupine good and steady prospecting is going on. Ontario No. 2 looks well, and with energy the owners may look for good results. The Empire company are working extensively, developing their respective claims. Buildings are going up and good roads to their property are being made. Within a few weeks the whistle of their hoisting engine will resound through the mountains. The Ontario mine and mill are running along smoothly with a full force of men.

FOUR large boilers in the mills of the Chesapeake Nail Works, at Harrisburg, exploded on the 25th inst. with tremendous force, killing one man, wounding badly four others and tearing the mills to pieces.

News in Brief.

EX-GOVERNOR PACHECO is now a stock-broker.

FISHING in Lake Tahoe is reported very fine at present.

MERCEDES, Queen of Spain, is dying from bleeding of the lungs.

CHARLES MATHEWS, the celebrated comedian, died on the 24th inst.

THE Free Labor exchange found places last week for 84 men and 15 women.

JOHN O'SHEA, an old resident of Lake county, was drowned while bathing in Soda bay, in that county.

THE condition of the Emperor of Germany is satisfactory. His power of moving his left arm is increasing.

VANCE, ex-member of Congress, has been adjudged insane, and taken to Athens for confinement.

At Mansfield, Ohio, lately a mob of 20,000 persons broke into the jail-yard to witness a hanging.

MONSTROUS seals and sea lions are being caught in fishing nets near the mouth of the Columbia river.

GENERAL FORSYTHE, of Sheridan's staff, reports that there is no cause for an Indian alarm in Wisconsin.

NINE members of a gang of counterfeiters, having their headquarters near Baxter Springs, have been arrested.

In and about Lyons, France 200,000 women and girls work from 11 to 13 hours a day for an average of 40 cents.

A COMPANY will soon commence building a narrow-gauge railroad from the town of Sonoma to deep water on the creek.

A YOUNG lady, of Sacramento, is dangerously ill from the effects of using a chemical preparation to bleach her hair.

HIGINIO CIMA, a real estate agent, in this city, fired three bullets into his head last Monday, causing fatal injuries.

A MR. MACKENZIE is agitating a project in London for opening up Central Africa to European commerce and civilization.

TWELVE thousand tickets for the Union Sunday School picnic at Woodward's Gardens have been sold, and more are wanted.

THE Russians have 52,000 sick in the Balkan peninsula, and of the recruits raised in 1877 for the Armenian campaign, 25% are dead.

THE Bear River ditch company, of Placer county, offer free water for five years for the irrigation of orange or lemon plantations.

A TROUBLE has occurred among the Trustees of the Mechanics' institute, in this city, which may possibly postpone the contemplated fair.

THE works of a plow company on Passaic river, New Jersey, have been burned, throwing many men out of employment; loss \$100,000.

On the 21st inst., Edmund Hanrahan killed his wife Mary, and Michael Sheehan, in San Francisco, with an axe, being actuated by jealousy.

A MAMMOTH bark is being built on Puget sound for the San Francisco lumber trade. Her carrying capacity is to be 1,000,000 feet of lumber.

DEL NORTE county bids fair to become the great butter county of the State. This county shipped, during the last season, \$50,000 worth of butter.

MADAME BONAPARTE, of Baltimore, who is about 96 years old, is in the enjoyment of fair health, having recently recovered from a severe attack of illness.

THE decline in rents at New York, this year, makes a difference of \$1,000 a day in the income of the Astor property and of about \$100,000 a year on the Stewart property.

PAUL J. KEDROLIVANSKY, Russian Archbishop, died in this city, last week, from fracture of the skull, but whether it was a case of assassination or suicide seems doubtful.

NINETY-SIX pounds of ice per man is daily consumed in the lower levels of the Consolidated Virginia and California mines in cooling the drinking water for the miners.

THE whale fishery at San Simeon, Cal., has been unsuccessful the past season, but three whales have been captured, while in former years as many as 23 have been taken in a single season.

PRESIDENT MACMAHON, upon the recommendation of his Ministers, has decided to pardon 800 communists on the occasion of the national festival, on the 30th inst., in honor of the exhibition.

DESIDERIO PODERCA, second in command at San Elizario, who commanded the firing party, in December last, that executed Howard, Atkinson and McBride, was arrested on the 16th by State troops.

A TERRIBLE rain fell in southwestern Kansas last week, 25 inches falling in one afternoon. Great damage was done to the crops, bridges, etc. Some lives were lost and many cattle, hogs and poultry drowned.

On Sunday last the advance of troops of Gen. Howard attacked the Indians at Curry creek, 45 miles from Harney, Col. Robbins and two soldiers were killed during the engagement. The Indians were repulsed.

It is reported that farmers in various parts of Ohio are receiving notices signed, "Working-men's Bread and Blood Committee," and warning them against buying labor-saving machinery, and especially self-binding reapers. Threats are made that every such reaper will be destroyed and stacks of grain burned if an attempt is made to use them. No cases of violence, however, have yet been reported.

THERE are 146 convicts in the Nevada Prison at Carson.

Most of the Shoshones in Nevada refuse to join the hostile Indians.

PLYMOUTH CHURCH has excommunicated Mrs. Elizabeth Tilton.

GARIBOLDI is well again, and has resumed his walks round Caprera.

THERE were last week 400 births and 462 deaths in New York city.

THE thermometer in Tulare county, last week, ran up to 101 in the shade.

TEN thousand orange trees have been planted in the vicinity of San Jose, this spring.

FOUR young men were drowned at Halifax on the 26th inst. by the upsetting of a boat.

THE entire expense of Americans going abroad this summer will amount to about \$40,000,000.

OVER 150,000 young shad have been received in Sacramento, with which to stock California rivers.

THE estimated annual loss to agriculture in the United States from insects is not less than \$150,000,000.

MR. EDISON is going to Pennsylvania to rest, and "get away from curiosity hunters and interviewers."

CARDINAL ANTONELLI's estate, something like the Ward property, has shrunk from \$2,000,000 to \$120,000.

At her wedding, lately, the bride of W. W. Astor wore a diamond necklace worth \$500,000. It was the gift of Mrs. J. J. Astor.

T. V. ROY, a converted Brahmin priest, in Montreal, convicted of bigamy, has been sentenced to three months' imprisonment.

THERE is a rumor of gigantic land frauds having been perpetrated in California through counterfeiting the great seal of the State.

JAMES G. FAIR, of Virginia City, is at the Palace hotel, his health having been much improved by his late visit to the Steamboat springs in Washoe.

A PARIS publishing house is preparing an edition of the Lord's Prayer in 1,200 languages and dialects. The book will be dedicated to Pope Leo XIII.

THERE is a terrible famine in the southern part of Morocco, caused by drouth. The inhabitants are said to be so reduced that they resemble living skeletons.

THE famous stallion "Cognac" (the man-eater), whose leg was broken about 10 days since from a kick by a mare, died on Sunday evening last at Petaluma.

At Savannah station, Los Angeles, last week, Charles Ellis, aged 15 years, was dragged to death by a horse to which he had thoughtlessly tied himself with a rope.

THREE car loads of excursionists left Salt Lake City, on the 25th inst., for San Francisco. They will take in the sights of California and expect to be absent a month.

It is ascertained that 2,748,000 sheep perished in New South Wales last year from want of food and water, caused by the protracted drouths, involving a loss of £2,250,000.

WILLIAM SOLEN has recovered \$15,000 damages from the Virginia and Truckee Railroad Company for injuries sustained from being run over by an engine, February 25th, 1876.

TOM WALLACE, the burglar, who so boldly walked out of the Municipal court-room in San Francisco while on trial some months since, has been recaptured at Evansville, Indiana.

JOHN B. CROWELL, one of the head men in the factories and tannery of Holden & Co., at Napa, committed suicide by cutting his throat with a razor. Temporary insanity was the cause.

ANDREAS JACOBSEN, a lad 17 years of age, while driving a horse in the bark-grinding mill in Wick's tannery, Petaluma, was kicked in the abdomen by the animal and so badly injured that he died.

ALEXANDER SLIEY and Frost Coles, brothers-in-law, fought a duel lately at Forest depot, Va., with carving knives. Sliey was killed and Coles dangerously wounded. They had both recently been married.

EL DORADO COUNTY is employing a large number of boys in preparing for the canning and drying season. In one single establishment, \$13,000 will be expended for material and labor.

SAN JOAQUIN VALLEY INDUSTRIES.—The edition of the Stockton *Daily Independent* of the 15th inst., is a most praiseworthy publication. It contains an exceedingly interesting and well written article, giving an account of the past history and present condition of Stockton. The article contains a great deal of statistical information in connection with the grain-raising interests of the State. It is, in fact, one of the most important papers yet written on the San Joaquin valley and its agricultural, business and industrial interests. In connection with it is published a large and replete map of the San Joaquin and Sacramento valleys, drawn by Mr. Jas. D. Schuyler, one of the editors of the paper. Anybody who wants to know anything about the resources of the valleys referred to or any matters connected with them, should get this number of the *Independent*. The edition is one of the most commendable we have seen and adds another point in favor of one of the leading and most enterprising journals in the State.

NARROW GAUGE CONVENTION.—E. Hulbert, Secretary, announces that he will call a convention of the National Narrow-Gauge Railway Association at Cincinnati, at an early day, at which it is hoped all the features of the rapidly spreading narrow-gauge system will be brought up and discussed.

Mining Ropes.

From an interesting review in the *Colliery Guardian* of a work entitled "A Descriptive Treatise on Mining Machinery, Tools and other Appliances used in Mining," by Geo. G. Andre, F. G. S., we take the following extract from the original for our readers. From the contents of the work, its author, and the specimens appended we agree with the *Guardian* "That those of our readers who desire to invest the needful cash, may safely purchase the two handsome volumes which Mr. Andre has just added to mining literature."

On the subject of pit ropes, the author gives the following formula and table which readers may find useful in determining the dimensions of a rope of a given material required to bear a given strain:

If C = the circumference of the rope in inches, and W = the breaking weight in tons, then for hempen ropes $W = 0.2 C^2$, for iron-wire ropes $W = 1.5 C^2$, and for steel-wire ropes $W = 2.5 C^2$. The safe working load may be taken at from one-fifth to one-seventh of the ultimate strength, according to the speed at which it is to run and the vibration to which it is to be subjected. Thus for iron-wire rope, the safe working load L will be $L = \frac{1.5 C^2}{5}$.

$L = \frac{1.5 C^2}{6}$, or $L = \frac{1.5 C^2}{7}$, according as the

speed of winding is to be moderate, high, or very high. Assuming the circumference to be 4 inches, the values of L will be 4.5 tons, 4 tons, and 3.5 tons respectively. The weight of the rope hanging over the pulley is, of course, included in the working load. A sufficiently close approximation to the safe working load of round wire ropes moving at high speeds may be found by multiplying the weight of the rope per fathom in pounds by five for iron wire and by eight for steel wire, the product being taken as representing hundred-weights. Thus the weight of a four-inch rope being 14 lb. a fathom, we have $14 \times 5 = 70$ cwt., and $14 \times 8 = 112$ cwt. respectively, for iron and steel wire. As before remarked, all of these results must be regarded as rough approximations, and, therefore, it is necessary, in determining the dimensions of a rope, to allow a wide margin of safety, which should never be less than one-fifth. Taking it generally at one-sixth, we may find the circumference of the rope by transposing the preceding formula in the following manner: $C = \sqrt{4 L}$ for iron wire and $C = \sqrt{2.4 L}$ for steel wire. If the working load be four tons, the requisite circumference of an iron rope will be $\sqrt{4 \times 4} = 4$ inches, and of a steel rope $\sqrt{2.4 \times 4} = 3.1$ inches.

Upon this page will be found a table showing the results gained with ropes of different sizes and materials, tested by this method.

In estimating the strains upon a rope, we must take account of that which is exerted upon it at starting. While the rope is moving at a uniform speed, the strain upon it will evidently be that of the working load. But as the load starts from a state of rest, the velocity is an accelerated one from the moment of starting till that in which the maximum speed of ascent is attained, and during this time the strain upon the rope will be greater than that due to the load, since a portion of the force exerted is expended in giving velocity to the load. The strain upon the rope during the time of accelerated motion is given by the following formula:

$$L = W \times \frac{W_s}{32.2 t} \text{ in which } L \text{ is the load required, } W \text{ the weight of the working load, } s \text{ the full speed in feet a second, and } t \text{ the time in seconds during which the accelerated motion takes place. Thus if the working load be 2 tons, and the full velocity 10 feet a second, the strains upon the rope will be}$$

$$2 + \frac{2 \times 10}{32.2 \times 5} = 2 + \frac{20}{161} \text{ tons, assuming that five seconds are occupied in getting up the speed.}$$

"One disadvantage of wire ropes is, that in passing over the pulley and in coiling round the drum they raise the load by a series of short vertical jumps, and thereby occasion a jerky strain, which tends to cause a rupture of the wires. This jerky motion, which is greatest in flat ropes, is diminished by increasing the diameter of the drum. Another serious disadvantage to be guarded against in using wire ropes is their liability to break suddenly without having previously exhibited any indications of weakness."

ELECTRICAL EXPERIMENTS.—M. G. Plauts has made some experiments upon distilled water with an electric current of high tension, by joining 20 secondary batteries, of 40 couples each, producing a current about equivalent to 1,200 Bunsen elements. He thus produces a number of beautiful luminous effects, constituting "a true electric kaleidoscope," imitates the phenomena which result from the fall of liquid drops in a plain surface, and shows that, with a sufficient quantity and tension of electricity, we can obtain not only electrified liquid globules, but even the electric spark itself in a globular form.

THE Eureka Con. mine in Nevada turns out weekly about 370 tons of crude bullion, valued at \$100,000.

Comparative Table of the Weights and Strength of the Hempen and of Wire Rope.

Mount Whitney vs. Fisherman's Peak.

The *Inyo Independent* contains a letter written by Prof. Brewer of Yale college in relation to the Mount Whitney controversy, in which he says: So far as one man could do it, I named the highest peak of that region Mount Whitney in 1864; for that right belongs not to me personally, than the exploring party of which I had command named it that time, on an expedition which I had planned and carried out so far as the means at my disposal allowed. We then named the highest peak in that group or region, published it to the world and very soon it had passed into the geographical literature of the world.

There was then no mistake or question as to which peak was called Mount Whitney, or which peak was the highest, or who discovered which was the highest. Mistakes and confusion came in later by giving the name to two peaks. This arose at first from a natural mistake, and afterward became curiously mixed into personal feeling. With those purely personal matters I have no wish to meddle. Whether Goodyear likes King or not; whether Lieut. Wheeler loves Prof. Whitney or not; whether Bowen and others are pleased with the late State Geological Survey, or its chief, or not, are matters which you may or may not be familiar with, which I do not care to discuss and which have absolutely nothing to do with the question as to the discovery and naming of the highest peak of that region.

The real question is a very simple one: Shall the name be allowed to stand where I (or my party) placed it in 1874? It was placed there when the first scientific exploration of that group of peaks was made. Had I then acted on the policy some later explorers have adopted, the late mistake might never have arisen. Had I then cared more for the *clat* of personally ascending what we believe to be the highest peak of the Sierra Nevada and less for what I believed to be the best for science and the State, I would have turned southward and made that a more prominent part of the summer's work. As it was, I chose what I thought to be the most important, as well as the most laborious part, although the least interesting, of filling out the reconnaissance to the northward, and sent Clarence King to get on the peak if he could with the scanty means I could furnish him. Any attempt to take Whitney's name off the peak where he put it will only advertise it the more.

GRAVEL MINING IN NEVADA COUNTY.—The Nevada Transcript says: The ordinary observer, unacquainted with the workings of the gravel mines, would have but a poor idea of the immensity of Nevada county's gravel mining resources, were he to rely on mere exterior indications. But to those who are conversant with what is being done in the way of hydraulic mining, the richness of our mineral resources is a matter of much pride, and they understand why it is that each year adds the appearance of prosperity to the community. We will cite the monthly yield, at the present time, of five of these bonanzas, with the workings of which we are personally acquainted. The largest of these makes an average monthly clean-up of \$50,000; two others of about \$40,000 each; still another of some \$30,000, and another that cleans up from \$10,000 to \$12,000 every three or four weeks. For various reasons, which mine owners understand without explanation, we are requested not to name these mines in connection with what they are doing until after the season's run has been made.

Coke from Anthracite Dust.

We know of several who have been interested in the coking of some of our poorer coals, and for their information we reprint the following from the *Metalurgical Review* by Jones Wister:

At the suggestion of a member of the Geological Survey of Pennsylvania, the writer made a number of experiments in using anthracite coal as a basis for coke. The additions of bitumen, gas tar (gas works waste) or bituminous coal, were all used in the mixtures with a view to supplying the necessary cementing qualities lacking in anthracite. An ordinary blacksmith's fire supplied the heat required, blacklead crucibles of about one pound capacity being used to receive the mixtures. The result arrived at proved several points:

1. That any mixture varying from 50% anthracite dust and 50% bituminous dust to 75% anthracite dust, 10% gas tar or bitumen—for they are interchangeable—and 15% bituminous dust, will make a beautiful steely, lustrous, heavy coke.

2. That a heat higher than can be obtained in a cooking oven is an absolute necessity to produce a good anthracite coke.

3. That in order to obtain a commercial success in producing anthracite coke, the utilization of the gas contained in the bitumen and bituminous coal must be a part of the process, at the present price of anthracite coal.

It may be interesting to state that through the kindness of the Harrisburg gas company the writer was enabled to make an experiment on a large scale; 260 pounds or 52% anthracite dust, 150 pounds or 30% bituminous coal dust, and 90 pounds or 18% gas tar, were taken, making a charge of 500 pounds, which was placed, after thorough mixture, in three ordinary cast-iron retorts. For four hours these retorts were subjected to the bright red heat employed in making illuminating gas in iron retorts. The coke resulting was perfect, though not hard enough for blast furnace use. It was tried in a blacksmith's fire and produced a very high heat, quite equal to that of the best soft coal fire, with the advantage of making a fire free from smoke. Were it possible to make anthracite coke on a large scale equal to what can be produced in a small way, there is no doubt that the vast hills of anthracite dust now cumbering the earth near the breakers would be utilized. The following mixture will make a solid, lustrous coke, provided the anthracite coal dust is finely pulverized and the bituminous coal and gas tar are thoroughly mixed before charging, and are subjected to white heat for about one and a half hours; 65% anthracite dust, 25% bituminous coal dust, 10% gas tar. The attendant loss of weight amounts to from 22% to 25%. A good coking bituminous coal was subjected to a similar treatment as the above mixture, and the result was an inferior coke, notwithstanding the fact that some coal coked well in a blacksmith's fire.

FORMATION OF CARBONATE OF LEAD.—S. de Luca describes six bronze goats, with lead bases, found in Pompeii. They were evidently designed for weights. The lead has been mostly changed into an amorphous mass of white carbonate. On the smallest weight a portion has become translucent and partly crystalline. On the largest weight there are definite crystals of carbonate, with a brilliant luster. Their formation, in a period accurately known, is noteworthy.

THE ENGINEER.

Flooding the Sahara.

This project is still engaging attention in England. Mr. D. Mackenzie lately delivered a lecture in London on a project for opening up Central Africa to commerce and civilization. The chair was taken by Mr. S. Cave, M. P., who, in his opening observations, fully recognized the importance of Mr. Mackenzie's project, without at the same time pledging himself as to its entire practicability. There was no doubt but that if the water of the ocean could be let into the desert the climate, the soil, and the sanitary condition would all be improved, as had already happened in the case of the Suez canal, the land about which had been changed from barren sand into a garden in which were cultivated tamarisk, the palm and the sugar-cane. Civilization would be served by the facility given for piercing Central Africa. Should Mr. Mackenzie's project prove a success ships might go from Southampton to Timbuctoo without breaking bulk. The lecturer began by stating that Africa was three times the size of Europe, and contained 200,000,000 of inhabitants. The only means of communicating with the rest of the world lay in the caravan tracks. In the Sahara desert there was a remarkable depression covering an area of about 60,000 miles. This depressed portion of the desert was called Eljuf, and was said to extend from within 12 miles of the sea-shore to regions in the close neighborhood of Timbuctoo. The theory of both ancient and modern geographers was that Eljuf was originally filled with water, which flowed into the ocean; but that a har having gradually formed at the entrance, the flow inwards was stopped, and the heat of a vertical sun caused the inside water to evaporate. After some further details, the lecturer recommended the establishment of a missionary and commercial station at Cape Suby, on the seaward side of Eljuf, and the raising of a fund of £2,000 for exploration purposes, and to test the practicability of reopening the ancient channel, and of letting the water of the Atlantic into the depressed portion of the desert.

Expedition to the Land of Midian.

The English technical journals are just now full of accounts of Captain Burton's exploration of this re-discovered El Dorado. The expedition was fitted out under the auspices of the Egyptian government, and occupied some four months in the work of examination, having traveled and voyaged over 2,500 miles. The result appears to have been highly satisfactory, as the expedition has just returned to Cairo, loaded with specimens of valuable minerals and with much special information. The collections made comprise, as reported in *Nature*, 25 tons of rock specimens illustrating the geology of the country; six cases of ores; five cases of coins, inscriptions, worked stones, fragments of melted metals, glass and pottery; more than 200 sketches in oil and water colors; photographs of the chief ruins, including the catacombs, temples, etc.; and finally maps and plans of the whole country, including 32 ruined cities, besides sketches of numerous locations where perambulating bands of miners, ancient and modern, have carried on mining operations. The specimens include argentiferous and cupriferous ores from Northern Midian, and auriferous ores from the south. There are collections from three turquoise mines. There exists, likewise, two great sulphur mines—one in the north, and the other in the south. Rock-salt occurs in abundance in two large lakes. The whole of the secondary formation of the region abounds in gypsum, and parts of it contain quantities of alabaster, of which traces of ancient quarries still exist, which appear to have supplied a number of the ruined cities.

Narrow-Gauge Railroads.

The *Railway Age* has compiled a table giving the localities, names and length of all the narrow-gauge railroads in the United States, to which is appended a summary here copied:

	Miles.		Miles.
Alabama.....	5.50	Nevada.....	119.75
Arkansas.....	73.00	Nebraska.....	26.00
California.....	210.05	New Jersey.....	63.17
Colorado.....	370.05	New York.....	56.29
Georgia.....	90.00	North Carolina.....	21.50
Illinois.....	214.50	Ohio.....	317.19
Indiana.....	63.86	Pennsylvania.....	205.43
Iowa.....	150.43	South Carolina.....	45.08
Kansas.....	84.00	Tennessee.....	36.41
Kentucky.....	23.50	Texas.....	164.50
Louisiana.....	5.50	Utah.....	184.75
Maine.....	15.00	Virginia.....	53.00
Massachusetts.....	34.16	Washington Ter.....	53.50
Michigan.....	40.50	West Virginia.....	19.40
Minnesota.....	30.00	Wisconsin.....	75.50
Mississippi.....	81.00		
Missouri.....	81.35	Total in U. S.....	3,082.24

Remarking upon the table, the *Age* says: "All of the roads named are three feet gauge except 13 of three feet six inches, one of three feet four inches, one of two feet, and one of 10 inches. The three feet measure is therefore the established narrow-gauge of the country, although it is not at all improbable that a still narrower gauge may come into use to some extent."

TRANSPORTATION THROUGH FRANCE.—The *British Trade Journal* calls attention to an unassuming exhibit of models, plans, and maps,

occupying only a small space at the Paris exposition. They represent a scheme which is calculated to exercise a powerful influence on Levant trade, and may be to wrest from Marseilles its commercial supremacy in the south of France. The collection of models and maps now on exhibition at the Paris shows the construction of a canal between the lower basins of the Rhone—that is to say, just above the *barre*—and the gulf of Fos, thus looking upon the *barre* as an impassable barrier and making a new mouth altogether for the Rhone. This canal is finished and the town is building, and now a railway is in course of construction along the banks of the Rhone, connecting Arles and St. Louis, which will finish the scheme. The establishment of this new Mediterranean port and canal will, of course, greatly benefit French commerce, in consequence of the ease with which goods will be dispensed all over France through the medium of the vast ramifications of the Rhone; but this great scheme has also its importance for England. When the canal arrangements in the center of France are complete, the Rhone will be placed in connection with the northern and northwestern ports of France, and we shall be able to bring goods cheaply across France by water instead of toiling in an expensive voyage round Gibraltar and the bay of Biscay.

THE ST. GOTHARD TUNNEL.—Late advices contain the information that the irregularity of the rock formations met with in the prosecution of the tunnel work had disappeared, and that at the present time the work is progressing through regular strata. The work on the south side is still in the gullies, and makes an average daily progress of about 10 feet; while on the north the work has not yet penetrated through the serpentine, which geologists had estimated to be but one-half of the thickness actually pierced. In this rock the rate of progress is somewhat slower. Upon this topic, the following news item, which is now going the rounds, may be of interest, viz.: "A London dispatch, May 22d, says a popular vote in the Canton of Zurich, Switzerland, rejected the scheme for the supplementary grant to the St. Gothard railway, by a very large majority. Other Cantons will probably do likewise. So the railway must be completed by Germany and Italy or remain unfinished."

A STEEP GRADE.—The *Railway Age* says: One of the most remarkable examples of engineering enterprise and boldness is found in the narrow-gauge extension, just completed, of the Colorado Central Road from Black Hawk to Central. The distance between these two places is one mile, but to accomplish it the road has to climb an elevation of 563 feet by a route four and one-eighth miles in length. The undertaking was pronounced impracticable by many experienced engineers, but has been successfully accomplished by means of zigzagging switches, heavy rock cuts, some of them 50 feet deep, four bridges, numerous deep fills, one of 100 feet, and heavy masonry. The work, which is of the most substantial character, is said to have cost \$15,000 per mile, or about \$60,000. A standard gauge road over this route would have cost vastly more if it could have been built at all, which is doubtful—a very good illustration of some of the advantages of the narrow-gauge system for special localities.

OCEAN TRANSIT.—Since 1840, the fastest steamships in the Atlantic trade have increased their speed from 8.3 knots per hour to 15.6 knots, and the consumption of fuel per 100 indicated horse-power has been reduced from 4.7 hundredweight to 1.9. In 1877, there were 182 steamers of 556,650 tons in the service, of which 125 of 377,905 tons were English. The record of rapid passages since 1840 shows a gradual reduction from 14 days to seven, and during the same time 56 steamers have been lost, with 5,430 lives. The year 1873 was the most disastrous of any, even vessels with 829 lives being lost, among them the *Atlantic*, with 545 lives. In 1854, the *City of Glasgow*, with 490 lives, and the *Arctic*, with 322 lives, were lost, making that year, the next to 1873, the worst on record.

LAND MAKING.—It is well known that a very large area of valuable land has been added to the kingdom of Holland by reclaiming it from the sea. Active preparations are going on for the commencement of the long-projected work of draining the Zuyder Zee. A dam 25 miles long is to be carried across the gulf, and upon this pumping machines are to be erected having 10,000 horse-power, and capable of discharging from the inclosed sea a quantity of water equivalent to 6,500,000 cubic meters daily. The work, it is expected, will occupy 16 years for its completion, and its estimated cost will be \$70,000,000.

SPECTRAL PHOTOGRAPHS.—Capt. Abney has recently been meeting with marked and interesting success in photographing the red and ultra-red end of the spectrum. In one of the photographs which he exhibited at the April meeting of the Astronomical Society the spectrum with numerous sharply-defined lines was visible as far below A as that hand is below F—i. e., to a wave-length of 10400 10th meters. He used silver bromide combined with resins.

USEFUL INFORMATION.

Nature and Character of Alloys.

In his writing on the "founding of alloys" in the *Iron Age* Mr. Edward Kirk lays down the following formulas: Alloys of gold, silver and copper are generally superior in strength to any of the more fusible metals, and may be forged either when red hot or cold. These three metals seem to unite in any proportions, and always form an alloy that is malleable when either hot or cold.

Pure gold is but little used in the arts; it is then too soft. It is generally alloyed with silver and copper, both to harden it and depreciate its value. Alloyed with copper, it forms gold of a red tint; with silver, it forms gold of a green tint; and alloyed with both copper and silver, it gives intermediate tints.

Pure silver is but little used alone; it is generally alloyed with a small amount of copper, which does not change its color, and greatly improves its malleability and working qualities.

When gold, silver or copper are alloyed with the more fusible metals—lead, tin and zinc—the alloy is less malleable and ductile than alloys of gold, silver and copper. They are extremely red-hot, and when heated to redness they will fly to pieces under the hammer; and alloys of brass, hell metal, etc., must be treated with precaution, and should never be taken out of the mold while red-hot.

Alloys of two parts copper and one part zinc are very soft and malleable, and may be drawn by hammering or easily cut with a file, but an alloy of one part copper and two parts zinc is as hard and brittle as glass, and may be easily pulverized.

An alloy of two parts copper and one part lead makes a soft, malleable metal, but is inferior to an alloy of copper and zinc. In alloys of one part copper and one part lead the lead will ooze out in cooling. In alloys of one part copper and two parts lead the lead will not unite, but will sink to the bottom when cooling.

Alloys of six parts copper and one part tin make a very hard alloy, and the alloy gets harder and whiter the more tin is added. Alloys of tin and copper should not be too rapidly exposed to the air, for if a large percentage of tin is used it will strike to the surface and ooze out or make hard spots in the casting.

Alloys of zinc and lead cannot be made without the addition of arsenic, unless the lead is alloyed in a very small quantity.

Alloys of zinc and tin are very hard and brittle, and are but little used alone. By the addition of copper to alloys of these two metals, the alloy is rendered more malleable and soft.

Arsenic makes all alloys hard and brittle, and is very dangerous to use. It is seldom used except to impart fluidity to the very infusible metals.

Alloys of lead and tin are very malleable and ductile when cold, but at a temperature of about 200° Fahr. they lose the power of cohesion and are exceedingly brittle. The alloys of tin and lead partake of the general nature of these two metals. They are soft and malleable when cold, even when a small amount of brittle antimony has been added.

An alloy of six parts lead and one part antimony is very soft and malleable, but an alloy of three parts lead and one part antimony is very hard and brittle; and an alloy of one part lead and one part antimony is harder and more brittle than antimony.

A NEW PHOTOGRAPHIC PRINTING PROCESS.—A new process, devised by M. Pellet, for photographic reproduction, in blue lines on white paper, of industrial drawings, plans, maps, etc., has recently been brought before the French Societe d'Encouragement. It is based on the property of perchloride of iron of being reduced to protochloride by light. The latter salt is not changed by a solution of prussiate of potash, while the former is immediately colored blue. The copying paper is immediately sensitized by immersion in a bath formed of 100 parts of water, 10 of perchloride of iron, and 5 of oxalic acid (or other vegetable acid). The drawing, on transparent paper, is placed on a dry sheet of the copying paper, which is called "cyanofor," and exposed to the light under glass (15 to 30 seconds to the sun in summer, and 40 to 70 seconds in winter; in shade the exposure varies from 2 to 40 minutes, according to weather). The electric light may be used. After exposure the sheet is placed in a bath of prussiate of potash (15 to 18% of water), which immediately colors blue all the parts where the perchloride has remained intact, but does not affect the parts where the salt has been reduced by the light. Then the drawing is washed with water, and passed into a bath of 8 to 10% of hydrochloric acid, which removes the salt of protochloride of iron; then it is washed again and dried. The drawing now appears in deep blue tints on a very white ground.

WASHING FADING GOODS.—For washing goods that fade, use crude ammonia instead of soap. Soiled neckties may be made to look like new by taking one-half a teaspoonful of spirits of hartshorn to a teacup of water; wash well, and if very much soiled put through a second water with less ammonia in. Lay it on a clean white cloth and gently wipe with another until nearly dry. Then lay a cloth over it and smooth with an iron not very hot. If the colors fade it will all come back to its original hue. Use no soap, and do not rinse.

The Cost of Running Locomotives.

As described by the *National Car Builder*, a plan is in operation on the middle division of the Pennsylvania railroad for ascertaining the exact amount of coal consumed by each engine.

The engineers take their turn on the "first in, first out" principle, and each is charged with the quantity of coal he uses. When an engine comes in, the quantity remaining in the tender is carefully noted, and the out-going engineer is given checks on which he places the amount given at starting, and at the various points on the route. When he returns any surplus he may have is credited to him. Then from the car record office is obtained the number of cars taken and brought back, and the distance run; also the number of loaded and empty cars, three of the former being equivalent to five of the latter. To this is added the wood used in firing up, reduced to a coal basis. The result shows the pounds of coal used per car per mile, and the amount used by each engineer during the trip. Circulars are issued to the engineers, limiting the amount to be consumed per car per mile on the different classes of trains. The quantity for through freights is fixed at 2 6-10 pounds. At the end of the month, the number of cars each engineer has taken, and the number of miles they have been hauled is noted. Then the amount of coal he is permitted to use, and the amount actually used, are compared. If the actual consumption has fallen any number of pounds within the limits prescribed, the engineer and fireman are paid a premium on what has been saved.

Account is also taken of all stores used on an engine, such as waste, tallow, oil, etc., the coal consumed, and the repairs needed. From these, computations are made, and a monthly statement is issued called "a statement of the performance of the engines," which shows, among a great mass of other things connected with them, the cost of running an engine one mile. These statements reveal the fact that such cost varies from three to ten cents, according as the engine is old or new, and needs more or less repairs.

A New Modeling Clay for Sculptors.

For some time past a new modeling clay has been produced in Germany, and offered to the trade under the name of Plastiline, which has the advantage of not drying up, and saves the necessity of keeping the model continually under wet towels to prevent drying and cracking. Some sculptors, who are posted up in the progress of practical chemical applications, have tried tried to mix some glycerine in the clay, which tends also to keep it moist, but it is not liked so well, as it changes the nature of the clay somewhat and makes it sticky. The *Manufacturer and Builder* tells what this Plastiline consists of: A chemical analysis shows very easily that it is made of 10 parts fatty acids and fats, one part of oxide of zinc, six of sulphur and three of clay. To make it, a small amount of oleic acid, easily obtained from stearin candle factories and in some soap works, is mixed with zinc white and heated, so as to saponify the zinc with the acid, forming then a mass similar to wax when left to cool; this is then mixed with the rest of the fatty acids, the sulphur is then added in the form of flowers of sulphur, or otherwise very finely pulverized solid sulphur sticks; the clay is dried and also finely pulverized and all mixed as thoroughly as possible while warm.

Satisfactory results may be obtained by taking eight parts of glue separated with one part of zinc oxide, four parts of oleic oil, two of wax, six of sulphur and three of clay; as this gives a mass very much like the Plastiline, and will cost, when made wholesale, not over 25 cents per pound. It is stated that some German sculptors predict a great future for this modeling clay, as being far superior to the material heretofore used.

JELLY POWDER.—The well-known inventor and manufacturer of nitro-glycerine and dynamite, Alfred Nobel, has added another explosive to the list, the explosive "jelly powder," so called from its resemblance to calf's foot jelly. It consists of 94% or 95% of nitro-glycerine and 5% or 6% collodion cotton, so mixed as to assume a gelatinous form. It is tough, but can be easily cut with knives or shears, and applied to cartridge and balls. It is water-proof, acts in the same way as dynamite, but is at least 50% stronger, and does not possess the great defect of the latter in parting with its nitro-glycerine when damp.

GOOD HEALTH.

Resuscitating the Drowning.

Dr. Howard appears, as medical officer of New York harbor, to have had much to do with the resuscitation of persons who had been apparently drowned, and his method has received the approval of the New York Academy of Medicine. It has already received the national prize of the American Medical Association, and has been adopted by the Life-Saving Society of New York. His method is described as follows:

1. To Pump and Drain Fluids from Lungs and Stomach.—This is done by placing the patient face downward over a hard roll of cloth-

ing, so that the pit of the stomach is the highest point, while the mouth is the lowest. The operator supplements the pressure of his hands upon the back of the patient, above the roll, if necessary, with all the weight and force at his command.

2. For Artificial Breathing.—The patient, whose clothing is ripped open from the waist, is laid upon his back, and the pit of the stomach is made the highest point by a hard roll of clothing beneath the back, while the head is the lowest part. The wrists are crossed behind the head; these a second person, if present, pins to the ground with one hand, while with the other the tongue is held forward by a piece of dry rag. The greatest possible expansion of the chest is thus obtained. The operator, kneeling astride the patient, grasps the most compressible part of the chest, on each side of the pit of the stomach, and, using his knees as a pivot, throws forward, slowly and steadily, his whole weight, until his mouth nearly touches the face of the patient. Then, by a final push, he throws himself back to his first erect kneeling position. By the sudden removal of the compressing force, the elastic ribs spring back to their original position, and by this bellows action the air rushes into and is forced out of the chest alternately, as in natural breathing. Success may attend this process in a few minutes, but hope of a favorable result ought not to be given up under an hour.

In addition to its apparently superior effectiveness, Dr. Howard claims for this method the conspicuous advantage of unequaled simplicity. When he had the medical surveillance of such matters in New York, he found that one of the most noted facts connected with cases of suffocation and drowning was the probable absence of medical aid at the critical moment. Now, experience has shown that this method can easily be understood by the most illiterate persons, and may be carried into execution anywhere, with or without a doctor.

INFLUENCE OF GASLIGHT ON THE EYE.—The German Minister of Instruction has recently issued a report on the influence of gaslight on the eye. The conclusion arrived at in this report—the result of frequent conferences with well-known physicians—is that no evil results follow a moderate use of gas, if the direct action of the yellow flame on the eye is prevented. For this purpose screens or shades are employed. Very grave objections, however, exist to the use of zinc or lead shades, most evils affecting the eye being traceable to them. Their use, it is said, inevitably tends to blindness or inflammation and other harmful effects. The milky-white glass shade is the best, as it distributes the light and has a grateful effect on the eye. The burner should not be too close to the head, as congestions of the forehead and headaches result from the radiated heat. The glass plate below the gas, employed in some places, is especially useful for the purpose, as it causes an equal distribution of the light—necessary where a number are working at one burner—prevents the radiation of heat and tends to a steady illumination by shielding the flames from currents of air. In cases of highly-inflamed eyes, dark blue globes can be very beneficially employed. With precautions of this kind, no evil effects from the burning of gas need be feared.

VENTILATION OF SHIPS.—The Chief of the United States Bureau of Equipment and Recruiting says in his annual report: "I again respectfully ask the attention of the Department to the restricted space allotted to the crews of our ships of war. As a matter of efficiency alone, the health of the men is of primary importance. A ship loses her significance as a man-of-war unless manned by a vigorous crew. It is simply impossible to expect men to retain their health if compelled to herth and mess in the dense and mephitic atmosphere which is the natural result of their crowded quarters. Ventilation of our ships has never received the attention it imperatively demands. I respectfully urge upon the Department the propriety of appointing a board of medical officers to report upon this subject and to devise a method whereby the object may be assured." As an instance of the bad effect of crowding men on shipboard, it is mentioned that during the trouble between the United States and Spain, on account of the *Virginius* affair, when 3,000 additional men were enlisted for the navy, over 25% of them were incapacitated for service within a few weeks by reason of crowding them into vessels.

IMPORTANCE OF A CLEAN SKIN.—Most of our invalids are such, and millions of more healthy people will become invalids, for the want of paying the most ordinary attention to the requirements of the skin. That membrane is too often regarded as a covering only, instead of a complicated piece of machinery, scarcely second in its texture and sensitiveness to the ear or the eye. Many treat it with as little reference to its proper functions as if it were nothing better than a bag for their bones. It is this inconsideration for the skin that is the cause of a very large proportion of the diseases in the world. If, as claimed by some scientists, four-fifths, in bulk, of all we eat and drink, must either pass off through the skin or be turned back upon the system as a poison, and that life depends as much upon these exhalations through the skin as upon inhaling pure air through the lungs, it must be of the most vital importance to keep that channel free.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Stiles Rotary
 Engine; Notices of Recent Patents; Close of the Vol-
 ume, 401. The Week; Placer Mining in California;
 The Fumes of the Idria Quicksilver Furnace, 408.
 Esmeralda District; The Poor Man's Quartz Mill, 409.
 Patents and Inventions, 412.

ILLUSTRATIONS.—The Stiles Hercules Rotary
 Steam Engine, 401. Map Showing Location of Mines
 at Aurora, Nevada; View of Aurora, Esmeralda Dis-
 trict, 409.

CORRESPONDENCE.—Reducing Miners' Wages;
 Notes on Amador County.—No. 3; Mining in El Dorado
 County, 402.

MECHANICAL PROGRESS.—An Imperial Street
 Car; Automatic Cyclometer; The Care of Bridges; Ma-
 chine for Cleaning Ships' Bottoms; Pneumatic Grain
 Elevator; Specific Gravity of Bessemer Steel; German
 Workshops; Steam Road Wagons, 403.

SCIENTIFIC PROGRESS.—What is the Function
 of Chlorophyll? Further Liquefaction of the Gases;
 The International Geological Congress; Test of the
 Woolly Fiber; Spotted Fruit; A Curiosity, 403.

MINING SUMMARY from the various counties
 of California, Nevada, Arizona, Colorado, Montana and
 Utah, 404-405.

NEWS IN BRIEF on 405 and other pages.

THE ENGINEER.—Flooding the Sahara; Expedi-
 tion to the Land of Midian; Narrow-Gauge Railroads,
 406. Transportation Through France; The St. Got-
 thard Tunnel; A Steep Grade; Ocean Transit; Land
 Making, 407.

USEFUL INFORMATION.—Nature and Character
 of Alloys; A New Photographic Printing Process;
 Washing Fading Goods; The Cost of Running Locomo-
 tives; A New Modeling Clay for Sculptors; Jelly Pow-
 der, 407.

GOOD HEALTH.—Resuscitating the Drowning; In-
 fluence of Gaslight on the Eye; Ventilation of Ships;
 Importance of a Clean Skin, 407.

MISCELLANEOUS.—Mining Ropes; Mount Whit-
 ney vs. Fisherman's Peak; Gravel Mining in Nevada
 County; Coke from Anthracite Dust; Formation of Car-
 bonate of Lead, 406.

MINING STOCK MARKET.—Sales at the San
 Francisco, Pacific and California Stock Boards, Notices
 of Assessments, Meetings and Dividends, 412.

 elry, etc., Dewey & Jordan, S. F.; Quartz Mills, Almar-
 in B. Paul, S. F.; Delinquent Sale—Summit Mining
 Company; Assessment—Seaton Mining Company.

The Week.

The weather during the past week has been comfortable enough in San Francisco and throughout the coast region, but very warm in the interior, the thermometer in some of the inland counties having touched a hundred. The grain harvest is now under full headway in all the great agricultural districts of the State, creating a demand for all the suitable labor available. For the first time in several years, the supply of farm labor is just now insufficient for the demand, wages for this service being at the same time well maintained. The cereal crops, though injured in some places by chess and rust, will yield above the average; pasture is abundant, the products of the dairy, the garden, orchard and vineyard greater than ever before. The mines of California are turning out more bullion than for several years past, only wool and honey, among our staples, showing this year much falling off. The near approach of our national holiday has had its usual effect of slightly diminishing the volume of business through a partial diversion of the public mind from industrial and mercantile to patriotic considerations.

This week marks an era in the life of the MINING AND SCIENTIFIC PRESS, as the present number is the last of Volume XXXVI. We hope that all our readers who are with us at the close of this Volume will remain until the close of the next and many more to come, and that their number will increase as the PRESS increases in years and usefulness. We will commence on a new Volume next week with renewed vigor and a hope that before it is closed the depression which has hung over the country for the past year will disappear and good times come again once more to us and all.

Placer Mining in California.

As is generally well known it was in the placer or surface diggings that the first gold mining in California was carried on. Being rich, extensive and easily utilized, the average earnings of the miners were at first very large. With the exhaustion of these surface deposits the miners earnings diminished, the amount of capital required for successfully engaging in this branch of business having meantime increased in a like ratio. What further resulted from the gradual depletion of this class of deposits was the searching after and finding of new kinds of placers, and the invention of both labor and gold saving methods and appliances in the prosecution of this industry. From the river bars, to which it was at first confined, mining was extended to the auriferous gulches and flats, then to the beds and banks of the streams, and still later to the old basins and channels filled in or buried up long ages ago. The gold-bearing bluffs and beaches were discovered, the re-washing of the accumulated tailings commenced, the seam-diggings revealed themselves, and new sources of gold production were in various other ways discovered or invented. Among the more economic devices early brought into use was the hydraulic plan of washing, which from a very cheap and simple application of water for the purposes of gold gathering, has grown into the vastly more expensive and effective apparatus now employed to that end. From mere cotyoling along the edges of the deep buried channels, drift operations have been carried far under the mountains, the great subterranean excavations being traversed now by iron tramways, over which the steam locomotive hauls the gravel trains, before dragged out by mule power or pushed out by hand.

In this province of mining gold savers and gleaners with new ways for effecting labor, cost, and retrenchment, have been introduced to an extent that covers the primitive business almost from sight. The pioneer gold seeker, unless kept posted, would fail to identify his old calling were he to revisit the scenes of his former labors, because of the new fields into which it has been advanced, and the many strange and monstrous modes and mechanisms adopted for carrying it on. He was credulous and visionary enough, this early seeker after the precious dust, and ever ready to bunt for the same in the most out-of-the-way places and by the most impracticable methods, yet it never entered into his plans nor yet into his wildest imaginings to search for it in the way we are now doing. It occurred to him to turn aside the rivers from their channels, and to sink shafts for getting down into the deep pits and basins, but to dredge out or tunnel under the river beds and lift the rich gravel from these depressions by hydraulic elevators, was left to be accomplished by modern inventors; this department of mining having been marked by more ingenious devices, bold and original enterprises and a more constant progression than any other.

While it is true that the more accessible auriferous deposits in California have been pretty well worked out, there are places where, because of a lack of water for gravel washing, they still remain almost untouched. In many of these localities good wages have been made the present season, water having been so much more plentiful than usual. Not more than two or three times perhaps during the past thirty years has the natural supply of water been so abundant and held out so well as this season; and, as our miners have not failed to turn the same to good account, bullion receipts from this source will this year be considerably augmented. As it would be difficult and in most cases impossible to bring water upon these gold-bearing grounds, because of their altitude or isolation, they will be likely to long remain a sort of preserve for the unemployed and claimless placer miner.

For the reason just mentioned this has also been an auspicious year for hydraulic operations, which now yield more than two-thirds of the revenues derived from placer mining in this State. With most of the small operators the season of active work has closed. The larger as a general thing continue washing, some running a diminished amount of water, and others a full head. A few companies like the North Bloomfield, Eureka Lake Consolidated, the Milton and the Nevada, having a great extent of catchment and large storage capacity, or like the Little York, almost perennial sources of water supply, send through their pipes nearly as much water as during the spring months. Within the next sixty days the flow with most of these companies will suffer serious abatement, though a few will probably be able to continue washing on a reduced scale throughout the season. So far as clean-ups have been made this year with the hydraulic miners, they have been large, much exceeding in the aggregate those of any previous year. Having removed or overcome most of the obstacles that barred their way to an earlier success, hydraulic miners and investors stand a good chance of making money hereafter. The future of this industry is, in fact, altogether encouraging. Where the conditions are favorable and the management good, profits may be counted upon with more certainty than attends almost any other branch

of mining. Where the conditions are adverse, as where there is insufficient water, lack of outlet, poor gravel, overlying or interposing strata of barren matter, sliding ground, beds of boulders, etc., then scarcely any class of mining is attended with so much vexation, disappointment and disaster. It is the case, too, that through the almost entire appropriation and employment of all the water within easy reach for washing purposes, this province of mining is incapable of much further enlargement. There is still here and there an opportunity for inaugurating a new enterprise of this kind, but as a general thing, only under restricted advantages and on a limited scale, Trinity, Siskiyou, and other of the more northern counties now presenting the best openings for this class of operations. In the more central counties of the State it only remains for parties wishing to engage actively in this business on a large scale, or to acquire extended proprietary interests therein, to purchase properties already outfitted and supplied with water, or else effect this by securing and aggregating many small claims into a single estate, as may sometimes still be done.

To the expansion of drift mining on the other hand, scarcely any limit can be set, as this class of diggings generally supply themselves all the water required for gravel washing, while their extent is very great. The explorations of the Pliocene basins and water courses which form the sites of these operations show them to traverse nearly all parts of our gold fields, presenting repositories of mineral wealth that only centuries of energetic exploration can exhaust. Being little dependent upon the weather or water supply, the returns from the drift mines since the business came to be prosecuted with more system and better understood, have been quite uniform, and in the main highly satisfactory. Every year increased attention is being paid to this class of diggings, Placer, Nevada, Sierra and Plumas having heretofore been the counties in which these deposits have paid the best and been most fully developed. Under the table mountains of Calaveras, Butte and Tuolumne the old channels have also been extensively and profitably worked. With the drifters generally, this has been a prosperous year, and there is every reason for believing the business will continue to thrive and expand into the undefined future.

Tailing claims, though not numerous, are paying remarkably well this year, and a number of projects for rehandling great quantities of this material have lately been set on foot, some of them being now fully perfected and ready for operations. In the rewashing of the auriferous debris that rests along the mountain streams and interior rivers of this State, another field is opened that strongly invites the attention of the capitalist and gold washer, and it will probably not be long till this neglected stuff will be made to yield up a large percentage of the gold, sulphurets and amalgam it is known to contain.

Cleaning out the modern rivers with dredging machines and exploiting their beds with tunnels, though yet in their experimental stages, promise good results, the few trials made with the hydraulic elevator, another novelty in placer mining, having proved wholly satisfactory. Of our gold beaches and bluffs, it can only be said, that while they are known to carry a notable quantity of free gold, the particles are so light and fine that they have, with few exceptions, eluded the efforts made to catch and collect them. Experiments, however, are still in progress, there being those who, after so many years of failure, are still sanguine that they will be able to make the washing of these gold-bearing sands remunerative.

A VAST AMOUNT OF WATER.—There are 2,000 tons of water being daily thrown out by the pumps at the C. and C. shaft. This has been going on for the past two years, and fully 1,460,000 tons of water have been discharged from the shaft during that time. The water is what the mine experts call regular "channel drainage," in contradistinction to the large subterranean reservoirs sometimes encountered. The water is raised nearly to a level with the upper floor of the main hoisting works, where it is discharged into a large box, the bottom of which is pierced with holes. It then falls in a shower to a large tank in the basement, when it is used in the condenser of the pumping engine. As the shower of water falls through the air a distance of over 20 feet it is much cooled. After it has been used in the condenser it runs away in a flume to the battery mill below, does its work there and then—carrying with it tailings—goes to the reservoirs above the Omega tailings on Six-mile canyon. The tailings are deposited in the reservoirs and the water goes to the mill where it is again used. Below the Omega mill, in conjunction with the streams of water flowing down Six-mile and Seven-mile canyons, it is used in other mills, and further down assists in turning the wheels of many water-mills.—*Territorial Enterprise.*

THERE are 2000 tons of water being daily thrown out by the pumps of the C. & C. shaft, at Virginia City. This has been going on for the past two years, and fully 1,460,000 tons of water have been discharged from the shaft during that time.

QUICKSILVER is about the only article of merchandise which just now shows life, the market being very strong at 42½ cents, with an upward tendency under a brisk demand and light receipts.

The Fumes of the Idria Quicksilver Furnaces.

(Translated from DINGLER for the MINING AND SCIENTIFIC PRESS.)

A few extracts from an interesting article on this subject by Teubner have appeared in various journals, we translate the article in full for the benefit of such of our readers as are interested in the subject:

The smoke of the quicksilver furnaces at Idria passes through condensation tubes cooled by means of water, then through a system of chambers and flues (into one central flue), and at the end of this system, in all 270 m. (885.79 feet) long, it passes out through a chimney 14 m. (45.93 feet) high. The necessary draft is produced by a grate-fire at the foot of the hillside upon which the central flue rests. The small amount of mercury which escapes from the chimney with the smoke is not mercury vapor, but is mechanically removed by the fixed ingredients of the smoke, the soot and dust. This amount of mercury is very variable, and according to Teubner (*Oesterreichische Zeitschrift für Berg und Huttenwesen*, 1877, p. 123,) varies from 1% to 47%. This total amount includes that which is there as metallic mercury as a salt (more particularly the basic sulphate), and as the sulphide (cinnabar dust).

For example, four soot analyses contained mercury as follows:

As a salt.....	7.32	3.06	6.10	12.69
Metallic.....	3.12	14.59	0.02	0.17
As sulphide.....	27.33	1.83	3.40	9.80
Total.....	37.77	19.48	10.42	22.66

According to three determinations of Paterna in the summer of 1876 there are discharged 201, 770 and 1,088 g., or on an average 686 g. (1.5 English pounds) of mercury from the central chimney, about 0.007% of the production. (Time is not mentioned, but probably every 24 hours is intended).

And as the mercury contained in the smoke is chiefly there as sulphide, so the fears of its deleterious influence on the neighborhood seems to be in every case exaggerated.

The first soot analysis gave the following results:

Metallic mercury.....	3.12
Mercuric sulphide.....	10.83
Mercuric sulphide (cinnabar).....	31.10
Ferrous sulphate (coppers).....	6.02
Magnesian sulphate (epsom salts).....	7.50
Potassic sulphate.....	1.24
Ammoniac sulphate.....	0.54
Silica.....	2.20
Organic matter soluble in ether.....	5.90
Water and aromatic matter (aromatizische Stoffe).....	10.30
Carbon.....	19.80
Total.....	97.65

The gaseous part of the chimney smoke consisted of sulphureted hydrogen, sulphurous acid, carbonic oxide, carbonic acid, oxygen, nitrogen and steam.

The sulphureted hydrogen and sulphurous acid were determined by weight, the other constituents by volume according to the methods of Bunsen. The following is the result of several analyses which agreed very closely:

Sulphureted hydrogen.....	0.004
Sulphurous acid.....	0.050
Carbonic acid.....	5.636
Carbonic oxide.....	1.740
Oxygen.....	15.400
Nitrogen.....	77.170
Total.....	100.00

Finally the amount of gas passing from the central chimney in 24 hours was determined, from the cross section of the chimney (1.331 sq. m. = 14.3 sq. ft.) and the velocity of the smoke. The latter was determined with sufficient accuracy by introducing small fragments of paper and noting how long it took for them to appear at the top of the 14 m. chimney. The velocity so determined was on an average 1.66 m. (5.45 ft.) per second. This gives, therefore, the following amounts of gas as discharged from the chimney in 24 hours:

Sulphureted hydrogen.....	5.9 cu. m.
Sulphurous acid.....	73.5 " "
Carbonic acid.....	8235.0 " "
Carbonic oxide.....	2558.0 " "
(1 cubic meter = 35.29 cubic feet.)	

From the action of the gaseous part of the smoke, therefore, there is little to fear, as in fact the uninjured vegetation about the central chimney and the whole region of the mountains within reach of the smoke plainly showed.

CONGRATULATIONS.—Taking up a pencil laden with the perfume of orange blossoms and the fragrance of wedding cake, we haste to extend our congratulations to a young gentleman in our employ, who has bravely crossed the line which separates nothing from everything. Our esteemed bookkeeper and accountant, Mr. W. H. Thompson, has so far advanced in mathematical accuracy that he has proved that one and one make one. The one in his case, or at least the better half of it, was Miss Katie Woodward, an accomplished young lady of East Oakland, who is now enshrined in a cosy home as Mrs. Thompson. Our sincerest wishes are for their success and happiness. May our associate's balances always be on the right side and his bills never grow longer than his coin bag.

The leading hotels of Oakland are crowded with guests.

Esmeralda District.

From Mr. Wasson's pamphlet on "Bodie and Esmeralda" recently issued, we take some facts concerning the famous Esmeralda district, which has recently come to life again and now attracts considerable attention. After describing the circumstances of the first discovery of the district, he gives more account of the progress of affairs and says: "Although exceedingly rich prospects were obtained on a score of claims and work on an unsystematic character performed on hundreds, no particular excitement was created until the fall and winter of 1862-3, when the Wide West bonanza was discovered. The first mill, however, was erected in 1861 by Edmund Green, the Superintendent of the Wide West. The ore chutes of the Wide West, Johnson, Chihuahua, Pond and Del Monte, covering an extent of ground of over 1,200 feet in all, were all of a character as to richness and size, and out of them the bullion was produced. A dozen other claims contributed more or less to the hullion product, as the Utah, Ural, Garibaldi, Young America, Live Yankee, Empire, etc. Middle Hill, next south, was comparatively untouched, though evidently the most solid formation for deep exploration in the district. Silver Hill, the most southern point of interest, is about as much broken up on the surface as Last Chance, yet much work, after a kind, was performed; the Antelope claim producing a great deal of bullion. Mining those days on the part of everyone, as a rule, consisted of exhausting the surface deposits, regardless of what might be below a certain level. The Esmeralda people appeared to be a sort of lost tribe, considering the rich ore as manna fallen from above, and after 'gobbling everything in sight,' getting 'out of the wilderness' as soon as possible.

"By the spring of 1864, no less than 17 quartz mills were erected in the district, 10 of them being in operation; the Wide West, now Del Monte, and Antelope mills costing in all more than half a million dollars. Excepting the last named and two small affairs, all of these 17 structures, many of which were costly, are missing, the machinery being carried off to other districts. In 1868 the Union mill in Aurora was torn to pieces simply for the purpose of securing the large quantity of rich amalgam wasted around the battery and pans, so reckless and extravagant had things been carried on in early days. Doubtless several millions of dollars floated off down the creek toward East Walker river. Rock that would not mill at least \$75 per ton was cast aside, and no doubt many thousands of tons of ore that would pay well to mill lie around loose yet, though the crevice miners, 'the coasters,' have culled things pretty closely. For several years subsequent to the great excitement, the old rich ore chambers constituted a sort of empty sugar barrel, out of which, like street boys, they obtained many a sweet toothful. John Neidy, present District Recorder, a man of good judgment, was a large operator in this way, realizing in the course of three or four years over \$75,000. This coyote work has left most of the old shafts, drifts and tunnels, such as they were, in a state of confusion worse confounded. They were started everywhere and have ended nowhere."

Mr. Wasson states that it has been a difficult matter to get at the yield of the district during those days. J. S. Jamison, formerly in the express office at Aurora, is of the opinion that about \$12,000 altogether was sent from there prior to 1869. On the cause of the decline of the district, Mr. Jamison also writes: "My idea of the cause of the decline of the district, and I believe the generally received opinion is, that just at the time (1864-5) the rich surface deposits became exhausted, there was a great and general decline in all mining shares, and this, together with a great amount of litigation in regard to conflicting titles, caused stockholders in the various companies to refuse to pay or furnish the money necessary to prospect the mines to any great depth below where the surface deposits had given out.

"In other words, the surface deposits on the Comstock were exhausted, the shares dropping in value after the manner of Wide West and Del Monte, which were at one time selling at \$500 and upwards. [The law suits between the Wide West and Johnson claimants, the Del Monte and Pond, the Antelope and Young America, etc., forming a history of themselves. It cost the Del Monte about half a million for lawyers and shot-gun men. The labor performed on Last Chance hill presents to-day much the appearance of a military redoubt or series of intrenchments, where hand-to-hand fighting took place.] It became a question with the late W. C. Ralston, the holdest of operators, of abandoning either the Comstock

or Esmeralda mines. It was decided, at least, to sink deep under Mt. Davidson, and Mt. Braly, with its surrounding treasure hills, was left a solitary sentinel, as it were, over the most interesting ruins in the history of mining. Ralston, however, never gave up the idea of thoroughly prospecting Esmeralda district, and especially Last Chance hill, and to that end started up the old Juniata works at the ex-

dozen of the latter yet remain and being in particular demand. [Buildings that were sold for taxes one year ago now being valued at from \$10,000 to \$12,000 apiece.] After 14 years of neglect, the locusts are returning, and with a view of remaining indefinitely. So much depends upon the working of the new Del Monte, however, that speculation on that point is useless. Hundreds of wooden buildings were cou-

The Poor Man's Quartz Mill.

For several hundred years the Mexican arastra has constituted the poor man's quartz mill and the vein miner's best friend, inasmuch as it has during all this time furnished to his hand a cheap and simple means for earning an honest and independent subsistence, and very often for making a fortune besides. In the early history of California mining this primitive style of gold mill filled an important place, having been afterwards almost wholly superseded when our people became eager to earn money more rapidly and grew ambitious of conducting operations on a grander scale. But whether the laboring miner and even the capitalists has not been a loser through such a general substitution of complicated, ponderous and costly machinery for this rude implement is open to serious question. That the latter discounts the battery, copper plates, blankets, etc., as a means for saving the gold must be admitted, and it is hardly too much to say that many an enterprise that, burdened with the cost of a modern quartz mill, has resulted in failure, might through the employment of a suitable number of arastras have been made at least a moderate success. In Mexico 50 years ago the arastra was producing \$25,000,000 per annum. Mining there was then a grand success, the mass of miners being prosperous and happy. The English conceived the idea, so prevalent at the present time in California, that ponderous and extensive machinery, with its attendant expenses, would be correspondingly profitable. The fever ran high, they invested largely, and the result was as it has been here, failure in a great majority of the mining enterprises engaged in. Warned by these financial disasters, the Mexican miners have for the most part since stuck to the arastra, which with them remains the favorite apparatus for crushing the ores and amalgamating the precious metals.

We would not, of course, when the conditions are favorable, discourage the construction of large quartz mills, outfit and operated after the fashion now most in vogue. Very often these are the only establishments that can be made to pay. Where the ore is of low grade and abundant, men of large means should continue to engage in the business on an extensive scale. Under these circumstances heavy capital should be invested and great mills with their complicated gold-saving appliances be put up. But in most cases neither our mines nor our miners are thus conditioned. Generally our ores are of good quality but limited in extent, our mine owners being laboring men with but little money. What now they most require is the means to set themselves to work in a small way upon these properties. Having vainly solicited the aid of capital until they have become poor and tired of waiting, these men would gladly avail themselves of an opportunity, should any offer, to realize from their claims barely day wages. Now the question arises, how can this be done? With the old-fashioned slow-moving arastra even this is difficult. They need a machine which will combine something of its cheapness, simplicity and effectiveness with greater capacity for reduction. That the American miner will in this age of steam be satisfied with mule power, can hardly be expected. In some instances this will do very well, but as a rule steam or water must be had for the propulsion even of the arastra. To meet this requirement, Almarin B. Paul, the well-known millman and metallurgist, has invented an arastra that combines efficacy and economy in a large degree. Mr. Paul, who always works in the direction of our most pressing practical wants, has, to use one of his own expressions, fairly "Americanized the Mexican arastra," adapting it to our progressive ideas without divesting it of those distinctive features that so commend its use. The demand that has sprung up for this machine shows the appreciation in which it is held by our small mine owners, a considerable number of them having already been set to work in the mountains, where they have invariably given the greatest satisfaction. In another column of the PRESS will be found Mr. Paul's advertisement of this arastra, wherein the advantages claimed for it are more fully set forth and specifically described.

MAP SHOWING LOCATION OF MINES AT AURORA, NEV.

treme eastern base of Humboldt and Martinez hills; first, in 1872, and again in 1874. But this work was of a fitful character, not in a favorable locality, and on the occasion of his death was entirely stopped. The Bank of California fell heir to all the leading mills and mines, and out of this it may yet regain its former prestige."

It is a good many years since the old Esmeralda excitement, although many miners will

sumed as common fuel, a few of the very first and most worthless yet standing, affording a curious mixture altogether. In view of the town site of Aurora, 1 is the Court house and Esmeralda Herald office; 2, the new Real del Monte hoisting works; 3, Last Chance hill; 4, Middle hill; 5, Mt. Hicks; 6, Silver hill.

The new Real Del Monte company, incorporated in October, 1877, with a capital of \$5,000,000, and the Juniata with a similar capital.

VIEW OF AURORA, ESMERALDA DISTRICT.

recollect it. Now, as stated in previous articles in the PRESS, the district is in full swing again, with a number of mines in operation, a large amount of capital having been invested. The accompanying map will give the reader an idea of the position of the respective locations and a view of the town is shown in the other illustration on the page.

The town site is 8,000 feet high. Mt. Braly, in the background, is 10,000 feet. At one time Aurora had a population estimated at from 6,000 to 10,000, containing many substantial and presentable brick buildings. About a

Work is centered on the Del Monte. The Syndicate is a strong one, including Mackey & Fair, Sharon, Wells, the Cooks, Yerrington, Baldwin, Capt. Haynie, Boyd, Judge Belden and others. A first-class three compartment shaft is being sunk, and thorough and efficient work has been done by George Daly, the Superintendent.

The pamphlet from which these facts are gained gives a detailed description of all the mines in the district, with general information of all kinds of interest to miners. It is for sale at this office; price, \$1.

THE WEST SIDE CANAL.—The following is from the Stockton Independent of Thursday: The prospect for the completion of the West Side canal from Tulare lake does not seem flattering. The Commissioners have met and advertised for bids for the \$2,000,000 in 7% bonds which they are authorized to issue, the bids to be opened at Grayson on the first Tuesday in August. As they cannot negotiate them for less than 90 cents on the dollar, the general opinion seems to prevail that no capitalists will bid for them, and that the whole thing will fall through.

Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome street, San Francisco.

THE O'HARRA
CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:
One man, per day.....\$ 3 50
One man, per day.....3 00
Wood, 14 cords at \$3.....7 00

Cost of 20 tons.....\$13 50
Cost of one ton.....67½
From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Sutter Creek, Amador County, Cal.

GRAND HEADQUARTERS FOR MUSICAL BOXES.

M. J. PAILLARD & CO.,

Manufacturers and Importers of all kinds of

MUSICAL BOXES

—FOR—

Holiday, Birthday

—AND—

Wedding Presents,

OF STANDARD REPUTATION.

Our stock embraces the latest novelties, the newest and most pleasing airs, and the most approved appliances for rendering them with every shade of musical expression.

We offer this season many new improvements that must be seen to be appreciated, therefore buyers coming to San Francisco are invited to examine our stock—THE LARGEST IN THE CITY.

Medal and diploma awarded at the Centennial Exposition to our establishment in Switzerland for excellence in manufacture, durability, volume, purity of sound and superior workmanship. Also, medal awarded at the Mechanics' Institute Industrial Exhibition, San Francisco.

REPAIR DEPARTMENT.—Our workmen are especially educated to all kinds of intricate repairs, so that all repairs entrusted to us will meet with careful, skillful and prompt attention. We are recipients of many special patents for improvements in musical boxes.

M. J. PAILLARD & CO., No. 120 Sutter St., (Rooms 5 and 6) San Francisco.
680 Broadway, New York, and St. Croix, Switzerland.

MUSICAL BOXES

—FOR—

Holiday, Birthday

—AND—

Wedding Presents,

R. HOE & CO.'S
CHISEL TOOTH MILL, SHOP,

And Edger Circular Saws with
Recent Improvements,

Made especially to meet the requirements of the heavy work of this Coast, are now giving perfect satisfaction in the many mills in which they are in use.

A SIXTY DAYS' TRIAL,

Which we allow responsible parties, will convince them that they cannot too soon avail themselves of the advantages of a saw that is in perfect condition to run when they receive it, and always remains sharp, exactly round, and precisely the same to a hair in every respect, without any of the expensive skilled labor which other saws constantly demand. Both Fiere and Flee are dispensed with.

The teeth being always the same length, and the cutting angle always the same, they never dodge, but go through the knots in a surprising manner.

They never have to be taken off the mandrel, and will stand up square in edging any stock, which makes them indispensable for gangs.

The advantages being too numerous to mention in an advertisement, parties will please send for circulars and say they saw this in *Mining and Scientific Press*.

H. L. TATUM & Co., Sole Agents,

No. 51 Fremont Street, San Francisco

Also, agents for the ALBANY LUBRICATING COMPOUND AND CUTS, the only reliable method of lubricating machinery, doing it almost without attention, absolutely without drip or slop, and at a merely nominal expense, and for the WORLD STANDARD CYLINDER OIL, OF SAME MAKE.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch from Washington, D. C.

WEEK ENDING JUNE 11TH.
MACHINE FOR CRUSHING AND GRINDING ORES, ETC. THOS. MCGLEW, S. F.
MIDDLING SEPARATORS.—Berthold Newell, Sacramento, Cal.
POCKET FOR GARDENERS.—Thorold Greenbaum, S. F.
SPARK EXTINGUISHERS.—John Johnson, Bloomfield, Cal.
GEAR CUTTING MACHINES.—John A. Peet, S. F.
HAY PRESSES.—Jacob Price, San Leandro, Cal.
HATCHES FOR STREET ELEVATORS.—Philip Hinkle, S. F.
BROOM SEWING MACHINES.—Lionel Varicus, S. F.
BUTTON HOLE SEWING MACHINES.—Eugene, Moreau, S. F.

TRADEMARKS.
SODA AND CREAM OF TARTAR.—Charles R. Burrage, S. F.
COAL OIL.—M. Ehrman & Co., S. F., and New York, N. Y.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE estate of the late William C. Rheinlander is estimated to be worth about \$30,000,000. He was one of the seven largest real-estate owners in New York city. By his will his vast property will be managed by executors for the benefit of his children, who may divide it as they shall see fit.

THE trotting-horse, "Hiram," owned by H. Eldred, fell dead while trotting a race at Sacramento on Saturday last.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

EXAMINE the accelerated endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, \$30,533,429.94. Lewis C. Crover, President; L. Spencer Coghle, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Muncie, Jr., agent of insured, 224 Sansome St., San Francisco.

MR. W. J. WOOLLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

MODEL MAKER AND MACHINIST.—I. A. Heald, No. 51 Commercial St., San Francisco, (fourth floor).

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Gover Mining & Milling Company.—Location of principal place of business, San Francisco, Cal. Location of works, Amador County, near Drytown, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-fourth day of May, 1878, an assessment (No. 36) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 3, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Wednesday, July tenth, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the first day of August, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
W. O. WILSON, Secy.
Office, Room 3, No. 402 Front Street, San Francisco, Cal.

Pacific Plumbago Mining and Manufacturing Company.—Principal place of business, 228 and 220 Main Street, San Francisco. Location of works, 228 and 230 Main Street, San Francisco, Cal.
Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of June, 1878, an assessment of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, Room 18, No. 635 Clay Street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the twenty-fifth day of July, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
FRANK F. GILBERT, Secy.
Office, No. 635 Clay Street, Room 18, San Francisco, Cal.

Seaton Mining Company.—Location of principal place of business, San Francisco, Cal. Location of works, Drytown Mining District, Amador County, Cal.
Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-sixth day of June, 1878, an assessment (No. 11) of seventy-five (\$75) dollars per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, Room No. 18, Nevada Block, northwest corner Pine and Montgomery Streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the thirtieth day of July, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the twenty-first day of August, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
JOEL E. LIGHTNER, Secy.
Office, Room No. 58, Nevada Block, northwest corner of Pine and Montgomery Streets, San Francisco, Cal.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.
NOTICE.—There are delinquent upon the following de-

scribed stock, on account of assessment (No. 3) levied on the third (3) day of May, A. D., 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

able of conducting any sizes adapted to a five, ten or twenty-stamp mill, and furnish plans

We manufacture full or partial brick lined cylinder, embraces the devices covered by

by which any complete full or partial brick lined cylinder, embraces the devices covered by the patent to John successfully at the following mines in California, Nevada, Arizona and erected and operated by Leonard Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Montana: Camanche, Endowment and Alice. At least ten of them are now in active and Hackberry, Independence cases reduc in ores of the most refractory character.

successful operation of the merits of this furnace.

These facts are

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and have perfected arrangements with him, and also with Mr. James M. Thompson, who is a large owner in the White patent, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby caution all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, and we shall prosecute all parties infringing upon the same. For particulars, price and terms, address
